

ATTENTION FISHERS

Fisheries and Oceans Canada (DFO), in conjunction with the Pacific Salmon Commission, is conducting an internationally funded tagging study on migrating Fraser River sockeye in July-October 2003. The objectives of this study are to obtain information on the migration timing and survival of Late run sockeye. Recently, many Late run sockeye have entered the Fraser River earlier than normal and have died before spawning. This abnormal behaviour poses a serious conservation risk to all Late-run stocks including the world-famous Adams River run.

Approximately, 600 radio tags will be applied to sockeye in marine and freshwater areas. Radio-transmitters will be inserted into the stomach of each fish. Radio tagged fish will be evident by a thin wire antenna protruding from the mouth and an external, blue Floy tag attached to the antenna. Radio tagged fish will be tracked as they enter the Fraser River and throughout the watershed as they migrate toward their spawning grounds.

If you catch one of these tagged, please remove the radio tag with the Floy tag attached and contact DFO at once at one of the phone numbers listed below. Individuals returning radio tags to DFO along with information on time and place of capture will be sent the complete tracking history of the fish and a small token of appreciation for participating in the study.

The information obtained through your cooperation in returning these tags will directly contribute to improved management and conservation of Fraser River sockeye. Thank you for your interest and cooperation!

If you catch a radio tagged fish or you have any questions related to this study, please call the following two phone numbers:

Toll free in BC: 1-877-666-7575

U.S. Areas: 1-604 666 8833
