# GSI and Incidental Mortality 

Robert Kope
NMFS
Northwest Fishery Science Center
Seattle, WA

## Types of Incidental mortality

- Release mortality
- Sublegal fish
- Legal-sized fish in non-retention fisheries
- Unmarked fish in mark-selective fisheries
- Drop-off/drop-out mortality
- Fish that escape or drop out of gear and die
- Fish removed by predators

## Accounting for release mortality

- Estimate total encounters
- Apply release mortality rates to get total mortalities
- Allocate to stock/age groups

## Estimation of encounters

- Currently based on
- Assumed rates
- Historic rates (non-retention fisheries)
- Expectations generated by models (markselective)
- Logbooks
- Observer data

## Incidental mortality rates used for commercial Chinook fisheries

|  |  | sublegal | Legal | dropoff |
| :--- | :--- | :--- | :--- | :--- |
| CTC | Troll - AK | 0.255 | 0.211 | 0.008 |
|  | Troll - BC | 0.255 | 0.211 | 0.017 |
|  | Troll - OR,WA | 0.220 | 0.185 | 0.025 |
|  | Net | 0.9 | 0.9 | 0.0 |
| STT | WA-CA | 0.26 | 0.26 | 0.05 |
| WDFW | Puget Sound-seine | 0.45 | 0.33 |  |

## Incidental mortality rates used for recreational Chinook fisheries

|  |  | sublegal | Legal | dropoff |
| :--- | :--- | :--- | :--- | :--- |
| CTC | AK-CBC | 0.123 | 0.123 | 0.036 |
|  | SBC-Col R | 0.123 | 0.123 | 0.069 |
|  | Puget Sound | 0.123 | 0.123 | 0.145 |
| STT | WA-N CA | 0.14 | 0.14 | 0.05 |
|  | Central CA | avg | avg | 0.05 |
| WDFW | Puget Sound | 0.20 | 0.10 | 0.05 |

## Incidental mortality rates used for commercial coho fisheries

|  |  | sublegal | legal | dropoff |
| :--- | :--- | :--- | :--- | :--- |
| STT | WA-CA troll | 0.26 | 0.26 | 0.05 |
| DFO | BC troll | 0.26 | 0.26 |  |
|  | BC gillnet | 0.60 | 0.60 |  |
|  | BC seine | 0.25 | 0.25 |  |

## Incidental mortality rates used for recreational coho fisheries

|  |  | sublegal | legal | dropoff |
| :--- | :--- | :--- | :--- | :--- |
| STT | WA-CA | 0.14 | 0.14 | 0.05 |
| DFO | BC | 0.10 | 0.10 |  |
| WDFW | Puget Sound | 0.07 | 0.07 | 0.05 |

## Confinement estimates of Chinook marine recreational hooking mortality

Confinement estimates of coho marine recreational hooking mortality

## Allocation to stock/age groups

- Currently allocation is done by the harvest accounting models based on model assumptions
- CTC Model allocates proportional to calculated abundance of sublegal fish in stocks that contribute to the fishery
- CNR mortalities allocated on the basis of what the model expects stock composition to be
- Mark-selective mortalities not currently modeled for Chinook

## Considerations for using GSI to allocate of incidental mortalities

- Benefits
- Replaces assumptions with data
- Allows validation of model assumptions
- Sampling would facilitate direct estimation of encounters
- Drawbacks
- Lack of age composition without auxiliary data
- Stock resolution
- Sampling
- Design
- Fishermen vs observers
- SEAK 2006 - 1016 fishing days, 395 trips (logbook) vs 7 trips (observed)
