PACIFIC SALMON COMMISSION JOINT CHINOOK TECHNICAL COMMITTEE

2014 Exploitation Rate Analysis and Model Calibration<br>Volume Two: Appendix Supplement

TCCHINOOK (15)-1 V. 2

July 2015

## LIST OF APPENDICES

Appendix A: Relationship between exploitation rate indicator stocks, escapement indicator stocks, model stocks, and additional management action stocks identified in the Pacific Salmon Treaty annex ..... 1
Appendix B: ISBM indices ..... 7
Appendix C: Percent distribution of landed catch and total mortality among fisheries and escapement for exploitation rate indicator stocks by calendar year with analogous model stocks listed in parentheses ..... 13
Appendix D: Model estimates of the stock composition of the AABM and 3 ISBM ocean fisheries for 2013 and the average, 1985-2012 ..... 67
Appendix E: Figures of Chinook model-generated stock composition of actual landed catch for all (AABM and ISBM) model fisheries, 1979-2013 ..... 75
Appendix F: Incidental mortality rates applied in the CTC model ..... 101
Appendix G: Time series of abundance indices ..... 102
Appendix H: Abundance indices in total and by model stock for AABM fisheries, from Calibration 1402 ..... 103
Appendix I: Fishery exploitation rate indices by stock, age and fishery, based on CWT data ..... 111
Appendix J: Preseason forecasts including 2014 and postseason estimates for PSC model stocks, 1999-2013 ..... 123
Appendix K: Issues with ERA and model calibration ..... 133
Appendix L: Progress reports for individual projects funded in 2013 under the Coded Wire Tag Improvement Program ..... 137

Note: Product names used in this publication are included for completeness but do not constitute product endorsement.

# ApPendix A: ReLAtionship between exploitation rate indicator stocks, ESCAPEMENT INDICATOR STOCKS, MODEL STOCKS, AND ADDITIONAL MANAGEMENT ACTION STOCKS IDENTIFIED IN THE PACIFIC SALMON TREATY ANNEX 

## LIST OF APPENDIX A TABLES

Appendix A1. Indicator stocks for Southeast Alaska and Transboundary Rivers. ..... 2
Appendix A2. Indicator stocks for Canada ..... 3
Appendix A3. Indicator stocks for Puget Sound ..... 4
Appendix A4. Indicator stocks for the Washington Coast. ..... 5
Appendix A5. Indicator stocks for Columbia River and Oregon Coast ..... 6

Appendix A1. Indicator stocks for Southeast Alaska and Transboundary Rivers.

Note: NA = not available.
${ }^{1}$ SEAK fisheries will be managed to achieve escapement objectives for Southeast Alaska and Transboundary River Chinook salmon stocks.
${ }^{2}$ CTC escapement objective.
${ }^{3}$ Agency objective.
${ }^{4}$ Based on large spawners (age-. 3 and older).
${ }^{5}$ Based on index count of large spawners (age-. 3 and older).

[^0]Appendix A3. Indicator stocks for Puget Sound.

| Area | Annex Stock Group | Annex Indicator Stocks | Run Type | Escapement Indicator Stock | Escapement Objective ${ }^{1}$ | Model Stock | Escapement Goal in Model ${ }^{2}$ | Exploitation Rate Indicator Stock | CWT Acronym |

${ }^{2}$ Agency objective.
${ }^{3}$ Measured at Bonneville Dam.

## Appendix B: ISBM indices

## LIST OF APPENDIX B TABLES

Appendix B1. ISBM Indices for all British Columbia ISBM fisheries based on CWT-based exploitation rate analysis (1999-2012). The stock groups correspond to Annex 4, Chapter 3, Attachment IV of the 2009 PST Agreement.8

Appendix B2. ISBM Indices for all southern US fisheries based on CWT-based exploitation rate
analysis (1999-2012). The stock groups correspond to Annex 4, Chapter 3, and
Attachment V of the 2009 PST Agreement ..... 9
Appendix B3. ISBM Indices for all British Columbia fisheries, from the Chinook model (1999-2014) used to establish the Al for each year. The stock groups correspond to Annex 4, Chapter 3, Attachment IV of the 2009 PST Agreement.
Appendix B4. ISBM Indices for all southern US fisheries, from the Chinook model (1999-2014) used to establish the Al for each year. The stock groups correspond to Annex 4, Chapter 3, Attachment V of the 2009 PST Agreement.11

Appendix B1. ISBM Indices for all British Columbia ISBM fisheries based on CWT-based exploitation rate analysis (1999-2012). The stock groups correspond to Annex 4, Chapter 3, Attachment IV of the 2009 PST Agreement.

| Stock Group | Escapement Indicator Stocks | CWT Indices ${ }^{1}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| North/Central BC | Yakoun, Nass, Skeena, Area 8 | NA | NA | NA | NA | NA | NA | NA | NA | NA | NA | NA | NA | NA | NA |

Note: NA means not available because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc.).
1 The CWT-based estimates, not the model estimates, are to be used in postseason assessments.
2 An inconsistency was discovered between the approaches used to calculate the model-based and CWT-based indices. The former included harvest rates for terminal sport while the latter did not. Terminal sport harvest rates are now included in the calculation of both indices starting 2003. Further review is yet required to determine whether the base period terminal sport harvest rates obtained from analyses of Big Qualicum CWT recoveries adequately represent impacts that would have occurred on Cowichan Chinook salmon.
${ }^{3}$ Indices for the Nanaimo stock are calculated from CWT recoveries for Cowichan; differences between Nanaimo and Cowichan stock indices are due to differences in terminal harvest.
4 Several problems have been identified in the approach previously used to calculate the CWT-based indices for Nanaimo Chinook salmon; indices for this stock will not be reported starting 2003 as their utility is questionable.
${ }_{6}$ Stock or stock group with an agreed CTC escapement goal.
6 The terminal sport harvest rates for Chilliwack Hatchery Chinook salmon, the indicator stock, were removed from the calculation for the Harrison River naturals starting 2003 because sport harvest has been essentially zero on the natural population.
7 An error was detected in the Nooksack ISBM index estimate for 2011 as reported in TCChinook (14)-01; the corrected value appears here.
8 A review of the approach used to calculate both the CWT-based and model data-based indices for the WCVI naturals was carried out in 2008. A similar approach was adopted for both indices but due to modifications to the formerly used procedures, the historical time series of values was updated starting 2003.

Appendix B2. ISBM Indices for all southern US fisheries based on CWT-based exploitation rate analysis (1999-2012). The stock groups correspond to Annex 4, Chapter 3, and Attachment V of the 2009 PST Agreement.

Note: NA means not available because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc.).
1 Indices for the Nanaimo stock are calculated from CWT recoveries for Cowichan; differences between Nanaimo and Cowichan stock indices are due to differences in terminal harvest.
2 Although model-based indices were previously calculated separately for Cowichan and Nanaimo Chinook salmon; these did not adequately represent impacts on either LGS stock. This is because the model-based data represent an aggregate of the 2 stocks and methods do not currently exist to correctly disaggregate these data for calculation of the ISBM values. Until such methods are developed, a single index value only will be reported representing the aggregate starting 2007.
${ }_{4}^{3}$ Stock or stock group with an agreed CTC escapement goal.
4 For the Canadian ISBM fisheries, both Lake Washington and Green are assumed to have the same distribution and thus the same index value.

Appendix B4. ISBM Indices for all southern US fisheries, from the Chinook model (1999-2014) used to establish the Al for each year. The stock groups correspond to Annex 4, Chapter 3, Attachment V of the 2009 PST Agreement.

# ApPENDIX C: PERCENT DISTRIBUTION OF LANDED CATCH AND TOTAL MORTALITY AMONG FISHERIES AND ESCAPEMENT FOR EXPLOITATION RATE INDICATOR STOCKS BY CALENDAR YEAR WITH ANALOGOUS MODEL STOCKS LISTED IN PARENTHESES 

Landed catch distribution tables are available from the PSC office upon request.
These data result from cohort analysis of CWT recoveries for the indicator stocks; data within a row for each calendar year sum to $100 \%$. Total mortality includes landed catch and incidental (i.e., release mortality) which occurs in both retention and nonretention fisheries due to fatal contact with gear. Landed catch is from direct observation programs and incidental mortalities are estimated based on sampling data and/or internal algorithms (i.e., size-at-age vulnerability algorithms and gear-specific mortality rates). Data are not reported for a particular calendar year if there are less than 3 age classes present in the calendar year or if there are less than 10 estimated CWTs in the reported catch and escapement. Where relevant, the escapement portion of the distribution includes mortalities resulting from interdam loss. Escapement data is footnoted when it's missing or partially enumerated. Note there are substantive differences in this year's distribution tables as compared those previously reported; differences are due to changes in the 1) CWT database, 2) inclusion of a terminal troll fishery, 3) inclusion of a terminal stray category, 4) inclusion of additional CWT indicator stocks, 5) elimination of incorrectly assigned tag codes, and 6) fishery mappings. Changes to fishery mappings entails grouping stock-specific terminal fishery impacts in marine areas with the nonstock-specific preterminal fishery (e.g., time- and location-based Georgia Strait sport fishery impacts on maturing Big Qualicum River Fall Chinook are reported along with impacts on immature fish in one total under Georgia Strait Sport rather separated under Georgia Strait Sport and Terminal Sport).

## LIST OF APPENDIX C TABLES

Appendix C1. Percent distribution of Alaska Spring (Alaska South SE) total fishing mortalities among fisheries and escapement. ..... 17
Appendix C2. Percent distribution of Atnarko River (North/Central BC) total fishing mortalities among fisheries and escapement ..... 18
Appendix C3. Percent distribution of Big Qualicum River Fall (Lower Strait of Georgia Hatchery and Natural) total fishing mortalities among fisheries and escapement. ..... 19
Appendix C4. Percent distribution of Chilliwack River Fall (Fraser Late) total fishing mortalities among fisheries and escapement ..... 20
Appendix C5. Percent distribution of Chilkat River total fishing mortalities among fisheries and escapement ..... 21
Appendix C6. Percent distribution of Cowichan River Fall (Lower Strait of Georgia Natural) total fishing mortalities among fisheries and escapement ..... 22
Appendix C7. Percent distribution of Cowlitz Fall Tule (Fall Cowlitz Hatchery) total fishing mortalities among fisheries and escapement ..... 23
Appendix C8. Percent distribution of Dome Creek Spring (Fraser Early) total fishing mortalities among fisheries and escapement. ..... 24
Appendix C9. Percent distribution of Elk River (Oregon Coast) total fishing mortalities among fisheries and escapement. ..... 25
Appendix C10. Percent distribution of Elwha River total fishing mortalities among fisheries and escapement ..... 26
Appendix C11. Percent distribution of George Adams Fall Fingerling total fishing mortalities among fisheries and escapement. ..... 27
Appendix C12. Percent distribution of Hanford Wild Brights total fishing mortalities among fisheries and escapement ..... 28
Appendix C13. Percent distribution of Harrison River (Fraser Late) total fishing mortalities among fisheries and escapement. ..... 29
Appendix C14. Percent distribution of Hoko Fall Fingerling total fishing mortalities among fisheries and escapement ..... 30
Appendix C15. Percent distribution of Kitsumkalum River Summer (North/Central B.C.) total fishing mortalities among fisheries and escapement ..... 31
Appendix C16. Percent distribution of Lower River Hatchery Tule (Lower Bonneville Hatchery) total fishing mortalities among fisheries and escapement. ..... 32
Appendix C17. Percent distribution of Lewis River Wild (Lewis River Wild) total fishing mortalities among fisheries and escapement. ..... 33
Appendix C18. Percent distribution of Lyons Ferry (Lyons Ferry Hatchery) total fishing mortalities among fisheries and escapement. ..... 34
Appendix C19. Percent distribution of Lyons Ferry Yearling total fishing mortalities among fisheries and escapement ..... 35
Appendix C20. Percent distribution of Middle Shuswap River Summer (Fraser Early) total fishing mortalities among fisheries and escapement. ..... 36
Appendix C21. Percent distribution of Nanaimo River Fall (Lower Strait of Georgia Natural) total fishing mortalities among fisheries and escapement. ..... 37
Appendix C22. Percent distribution of Nicola River Spring (Fraser Early) total fishing mortalities among fisheries and escapement. ..... 38
Appendix C23. Percent distribution of Nisqually Fall Fingerling total fishing mortalities among fisheries and escapement. ..... 39
Appendix C24. Percent distribution of Nooksack Spring Yearling (Nooksack Spring Yearling) total fishing mortalities among fisheries and escapement. ..... 40
Appendix C25. Percent distribution of Nooksack Spring Fingerling (Nooksack Spring Yearling) total fishing mortalities among fisheries and escapement. ..... 41
Appendix C26. Percent distribution of Puntledge River Summer (Lower Strait of Georgia Hatchery) total fishing mortalities among fisheries and escapement. ..... 42
Appendix C27. Percent distribution of Queets Fall Fingerling (Washington Coastal Wild) total fishing mortalities among fisheries and escapement. ..... 43
Appendix C28. Percent distribution of Quinsam River Fall (Upper Strait of Georgia) total fishing mortalities among fisheries and escapement ..... 44
Appendix C29. Percent distribution of Robertson Creek Fall (WCVI Hatchery and Natural) total fishing mortalities among fisheries and escapement ..... 45
Appendix C30. Percent distribution of Samish Fall Fingerling (Nooksack Fall Fingerling) total fishing mortalities among fisheries and escapement ..... 46
Appendix C31. Percent distribution of Lower Shuswap River Summer (Fraser Early) total fishing mortalities among fisheries and escapement ..... 47
Appendix C32. Percent distribution of Skagit Spring Fingerling total fishing mortalities among fisheries and escapement. ..... 48
Appendix C33. Percent distribution of Skagit Spring Yearling total fishing mortalities among fisheries and escapement. ..... 49
Appendix C34. Percent distribution of Skykomish Fall Fingerling (Snohomish Wild) total fishing mortalities among fisheries and escapement ..... 50
Appendix C35. Percent distribution of Sooes (now Tsoo-Yess) Fall Fingerling (Washington Coastal Wild) total fishing mortalities among fisheries and escapement. ..... 51
Appendix C36. Percent distribution of Spring Creek Tule (Spring Creek Hatchery) total fishing mortalities among fisheries and escapement. ..... 52
Appendix C37. Percent distribution of South Puget Sound Fall Fingerling (Puget Sound Hatchery Fingerling) total fishing mortalities among fisheries and escapement ..... 53
Appendix C38. Percent distribution of South Puget Sound Fall Yearling (Puget Sound Hatchery Yearling) total fishing mortalities among fisheries and escapement. ..... 54
Appendix C39. Percent distribution of Squaxin Pens Fall Yearling (Puget Sound Hatchery Yearling) total fishing mortalities among fisheries and escapement ..... 55
Appendix C40. Percent distribution of Salmon River (Oregon Coast) total fishing mortalities among fisheries and escapement. ..... 56
Appendix C41. Percent distribution of Skagit Summer Fingerling (Skagit Wild) total fishing mortalities among fisheries and escapement ..... 57
Appendix C42. Percent distribution of Stikine River total fishing mortalities among fisheries and escapement ..... 58
Appendix C43. Percent distribution of Stillaguamish Fall Fingerling (Stillaguamish Wild) total fishing mortalities among fisheries and escapement ..... 59
Appendix C44. Percent distribution of Columbia River Summers (Columbia River Summer) total fishing mortalities among fisheries and escapement ..... 60
Appendix C45. Percent distribution of Taku River total fishing mortalities among fisheries and escapement ..... 61
Appendix C46. Percent distribution of Unuk River total fishing mortalities among fisheries and escapement ..... 62
Appendix C47. Percent distribution of Columbia River Upriver Bright (Columbia River Upriver Brights) total fishing mortalities among fisheries and escapement. ..... 63
Appendix C48. Percent distribution of University Of Washington Accelerated total fishing mortalities among fisheries and escapement. ..... 64
Appendix C49. Percent distribution of White River Spring Yearling total fishing mortalities among fisheries and escapement. ..... 65
Appendix C50. Percent distribution of Willamette Spring (Willamette River Hatchery) total fishing mortalities among fisheries and escapement. ..... 66

Appendix C1. Percent distribution of Alaska Spring (Alaska South SE) total fishing mortalities among fisheries and escapement.

${ }^{1}$ Estimates for this year can only be used for distribution of fishing mortalities because the escapement data are insufficient.

Appendix C16. Percent distribution of Lower River Hatchery Tule (Lower Bonneville Hatchery) total fishing mortalities among fisheries and escapement.

# Appendix D: Model estimates of the stock composition of the AABM AND 3 ISBM ocean fisheries for 2013 AND the AVerage, 1985-2012 

This appendix shows the model estimates of the stock composition of the catch for the 3 AABM fisheries (Appendices D1, D2 and D4), and 3 ISBM ocean fisheries (Appendices D3, D5 and D6). These estimates are based on the summation of the contribution of the 30 model stocks for each fishery, expressed as a percentage of the total catch.

The estimated stock composition may not reflect the true stock composition in a given year for several reasons:

1. The yearly catch estimates by stock are influenced by the base period stock composition in a fishery which may not reflect the current stock composition in the fishery, amongst the 30 model stocks.
2. The distribution of certain stocks may have changed over time.
3. The 30 model stocks do not represent all production present in a fishery.

For example, in the SEAK fishery a substantial component (over 20\%) of the catch is comprised of Alaska hatchery fish, most of which do not count as treaty catch and are not included in Appendix D1. Also, in the sport fishery portion of the present NBC AABM fishery, the base period data used is from fisheries which were located near shore and do not represent the current stock composition of the sport fishery which is located offshore.

Hence, these tables do not necessarily portray the true stock composition of the total catch of the fisheries in Appendices D1 to D6. There are genetic estimates for most of these fisheries in selected years which can provide more accurate accounting of contributions by stocks or stock groups.

## LIST OF APPENDIX D TABLES

Appendix D1. Southeast Alaska all gear ..... 68
Appendix D2. North BC troll. ..... 69
Appendix D3. Central BC troll. ..... 70
Appendix D4. WCVI troll and outside sport. ..... 71
Appendix D5. Strait of Georgia sport and troll. ..... 72
Appendix D6. Washington/Oregon troll and sport ..... 73

## Appendix E: Figures of Chinook model-Generated stock composition of ACTUAL LANDED CATCH FOR ALL (AABM AND ISBM) MODEL FISHERIES, 19792013

Stock abbreviations in each figure correspond to the following model stocks and aggregations.

| ORCST | Oregon Coast |
| :--- | :--- |
| CR-tule | Columbia River-Fall Tule stocks (Spring Creek, Lower River Hatchery, and Cowlitz Fall) |
| CR-sp\&su | Columbia River Spring and Summer stocks (Willamette, Cowlitz Spring, Columbia <br> Summers) |
| CR-bright | Columbia River Fall Bright stocks (Upriver, Mid-Columbia, Lewis River Wild, Lyons Ferry) |
| WACST | Washington Coast |
| PSD | Puget Sound stocks (Nooksack Fall and Spring, Natural Fall Fingerlings, Hatchery Fall <br> Fingerlings, Hatchery Yearlings, Skagit Wild, Stillaguamish Wild, Snohomish Wild) |
| FR-late | Fraser River Late stock |
| FR-early | Fraser River Early stocks |
| GS | Georgia Strait stocks (Upper, Lower Natural, Lower Hatchery) |
| WCVI | West Coast Vancouver Island Stocks (hatchery and natural) |
| NCBC | North Central British Columbia stocks |
| SEAK | Southeast Alaska stocks |

Note: This time series is NOT the first postseason Al for each year and is for trend analysis only (Figures 3.10-3.12). For evaluation of overage and underage, use the first postseason Al instead (Source 1402 PABD).

# Appendix H: Abundance indices in total and by model stock for AABM fisheries, from Calibration 1402 

## LIST OF APPENDIX H TABLES

Appendix H1. Abundance indices (Als) for the Southeast Alaska troll fishery by model stock and year (stock groups 1-15 this page; 16-30 on following page), from CLB 1402.
Numbers shown represent the portion of the AI total estimated for each model stock; the summation across all 30 stock groups equals the AI total for each calendar year. 104

Appendix H2. Abundance indices (Als) for the Northern BC troll fishery by stock and year (stock groups 1-15 this page; 16-30 on following page), from CLB 1402. Numbers shown represent the portion of the Al total estimated for each model stock; the summation across all 30 stock groups equals the AI total for each calendar year.

Appendix H3. Abundance indices (Als) for the WCVI troll fishery by stock and year stock groups 115 this page; 16-30 on following page), from CLB 1402. Numbers shown represent the portion of the Al total estimated for each model stock; the summation across all 30 stock groups equals the Al total for each calendar year.

108

Appendix H1. Abundance indices (Als) for the Southeast Alaska troll fishery by model stock and year (stock groups 1-15 this page; 16-30 on following page), from CLB 1402. Numbers shown represent the portion of the AI total estimated for each model stock; the summation across all 30 stock groups equals the AI total for each calendar year.

Appendix H2. Abundance indices (AIs) for the Northern BC troll fishery by stock and year (stock groups 1-15 this page; 16-30 on following page), from CLB 1402.
Numbers shown represent the portion of the Al total estimated for each model stock; the summation across all 30 stock groups equals the Al total for each

## calendar year.

Appendix H3. Abundance indices (AIs) for the WCVI troll fishery by stock and year stock groups 1-15 this page; 16-30 on following page), from CLB 1402.
Numbers shown represent the portion of the AI total estimated for each model stock; the summation across all 30 stock groups equals the Al total for each
calendar year.

| Year | Alaska South SE | North/Central | Fraser Early | Fraser Late | WCVI Hatchery | WCVI <br> Natural | St. of Georgia Upper | St. of Georgia Lwr Nat | St. of Georgia Lwr Hat | Nooksack Fall | $\begin{gathered} \text { Pgt } \\ \text { Sd } \\ \text { Fing } \\ \hline \end{gathered}$ | $\begin{aligned} & \text { Pgt } \\ & \text { Sd } \\ & \text { NatF } \end{aligned}$ | $\begin{aligned} & \text { Pgt } \\ & \text { Sd } \\ & \text { Year } \end{aligned}$ | Nooksack Spring | Skagit Wild | $\begin{gathered} \mathrm{Al} \\ \text { Total } \end{gathered}$ |

## APPENDIX I: FISHERY EXPLOITATION RATE INDICES BY STOCK, AGE AND FISHERY, based on CWT data

## LIST OF APPENDIX I TABLES

Appendix I1. Alaska troll Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data ..... 112
Appendix I2. Alaska troll Stratified Proportion Fishery Index (SPFI) values as total mortality, based on CWT data ..... 113
Appendix I3. Landed catch exploitation rate indices by stock and age in the NBC troll fishery, based on CWT data. Base period is 1979-1982 ..... 114
Appendix I4. NBC troll fishery Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data ..... 115
Appendix I5. Total mortality exploitation rate indices by stock and age in the NBC troll fishery, based on CWT data. Base period is 1979-1982 ..... 116
Appendix I6. NBC troll fishery Stratified Proportion Fishery Index (SPFI) values as total mortality, based on CWT data ..... 117
Appendix 17. Landed catch exploitation rate indices by stock and age in the WCVI troll fishery, based on CWT data. Base period is 1979-1982 ..... 118
Appendix I8. WCVI troll fishery Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data ..... 119
Appendix 19. Total mortality exploitation rate indices by stock and age in the WCVI troll fishery, based on CWT data. Base period is 1979-1982 ..... 120
Appendix I10. WCVI troll fishery Stratified Proportion Fishery Index (SPFI) values as total mortality, based on CWT data. ..... 121

Appendix 11. Alaska troll Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data.

## Appendix K: Issues with ERA and model calibration

## Changes to data and analysis involved in the ERA

In 2014, a standardized fishery structure of 186 fisheries across all PST jurisdictions was implemented in the CAS database for the ERA. Formerly, the fishery structure used to create the Cfiles, a text file summarizing the estimated recoveries for an individual CWT, was agencyspecific. Implementation of the expanded fishery strata required extensive review and modifications to the fishery definition tables in the CAS database. Three strata for escapement complete the output to the Cfiles for a total of 189 reporting strata. Two of the categories are new in 2014 and are described later.

The 189 Cfile reporting strata were mapped to a reduced total of 69 PSC reporting strata for output from the cohort analysis procedure. The 69 reporting strata (with escapement to the stream of origin being the $69^{\text {th }}$ ) was an increase from the previous 33 strata. The expanded reporting strata allowed for improved definition of stock-specific terminal fisheries, as well as country-specific designation of the true terminal fisheries for each CWT indicator. Previously, terminal freshwater fishery impacts were grouped under a single terminal sport or terminal net fishery regardless of whether the impacts occurred in the watershed of origin for the stock or in another watershed, or possibly even in the other country. Improved reporting strata for terminal fishery impacts will result in improved stock- and country-specific estimates of ISBM fishery impacts.

New and previously undefined strata for the estimated CWT recoveries were introduced in the list of 189 Cfile reporting strata and the 69 PSC reporting strata. These included Alaska Terminal Troll, and four categories for recoveries in freshwater areas outside of the watershed of origin (i.e., strays). The four stray categories are 1) any recovery in a freshwater fishery in Canada outside the terminal area defined for a stock, 2) any recovery in a freshwater fishery in the BC outside the terminal area defined for a stock, 3 ) any escapement recovery in Canada outside the stream of origin, and 4) any escapement recovery in the US outside the stream of origin. The new stray fishery and escapement reporting strata required modifications to the cohort analysis program. Modifications to the Visual Basic compute code were made so that the estimated recoveries in the stray categories were included in the estimation of the cohort sizes at age but were excluded from calculation of the true terminal fishery harvest rates. The structure of output files from the cohort analysis was modified to include the new stray categories to facilitate their use in subsequent calculations such as the ISBM indices. Formerly, if stray recoveries were included at all, and they occurred outside the other country of origin, they counted in the ISBM index of the home country.

Certain fishery strata were split into a finer scale. These included north of Falcon troll and south of Falcon troll (formerly WA/OR troll ) and QCI AABM sport, North ISBM sport, Central sport and Johnston Strait sport (formerly NCBC sport). These finer scale strata will improve separation of AABM and ISBM fishery impacts and provide information of greater utility to agencies. The new fishery strata required modifications to programs that read output files from the cohort analysis procedure. An example is the program used to generate the mortality distribution tables to correctly report AABM and ISBM impacts.

Programs that process output from the cohort analysis of the CWT recoveries also required modification to read the new expanded list of 69 PSC reporting strata and to process the stray categories as required (e.g., the program used to generate the mortality distribution tables).

DFO carried out a review of escapement data and CWT estimates for the CWT indicators which resulted in updates, mostly minor, throughout the historical time series.

A cohort analysis was completed for two new CWT indicator stocks. Results have been added for the Stikine River (STI) transboundary stock and the Middle Shuswap River stock (MSH) in the Fraser River system. New terminal marine sport fishery definitions were introduced for all four upper Fraser CWT indicators, DOM, NIC, MSH and SHU.

A complete time series of CWT estimates, including model base period years, was developed for the South Thompson First Nations net fishery occurring in Little Shuswap Lake and Shuswap River.

Estimated CWT recoveries in the lower Fraser River First Nations net fishery were reviewed and updated for all years.

The entire escapement time series for the Atnarko River summer stock (ATN/ATS) was recalibrated to the recent series of annual mark-recapture estimates and the escapement CWTs re-estimated as well. Other modifications to the cohort analysis for this stock included defining CWTs sampled from the Bella Coola large mesh gillnet fishery as terminal for all years. Auxiliary fishery files were generated containing estimates of CWTs for all terminal fisheries (marine and freshwater) for those years where either CWT sampling had not occurred or catch estimates had not been made.

DFO introduced new catch region locations (with new recovery location codes) for the Taaqwihak Economic Opportunity fishery, a First Nations hook-and-line fishery off the west coast of Vancouver Island.

## Changes to data inputs to the Chinook Model calibration

Changes to escapement or terminal run data in the FCS (forecast) file:

- FRL - entire escapement time series outside of the base period from 1985 onwards was updated
- RBT - entire terminal run time series from 1979 onwards was reviewed and updated
- GSQ - escapement from 2008 onwards was updated
- GST - escapement time series from 2010 onwards was updated
- PSF - entire terminal run time series was updated
- LYF - escapement time series from 2005 onwards was updated

Stock-specific FP values were calculated and entered into the Northern Troll FPA file to represent changes in impacts that have occurred given the DFO management objective of limiting impacts on WCVI-origin Chinook salmon since 2000.

Three variants of the forecast for the WCVI stock aggregate were provided by Diana Dobson (DFO) this year in addition to the standard forecast. The standard forecast has been based on a
fixed set of fishery scalars relative to fishery impacts observed in the 1979-1981 base period, with the expansion to the total aggregate based on high quality terminal run data available for the Somass River stock, the watershed-of-origin for the Robertson Creek CWT indicator. The decision was made by the CTC to use a variant forecast, which was based on fishery scalars reflecting recent exploitation rates, with separate expansions for each of the three large hatchery systems and the natural systems, to obtain the total aggregate forecast. The variant forecast was almost twice the magnitude of the standard forecast ( 216,728 vs 111,550 for the aggregate terminal return) but was considered to better represent the trends in abundance of the contributing stocks.

The agency forecast for 2013 was used as input in the model forecast (.FCS) file in place of the observed return in 2013 for some stocks. The 2013 return was not available in time for the model calibration for three of the stocks (PSN, WCH and WCN) but was available for three others (CWS, SNO and STL). The 2013 forecast and observed return for the latter stocks is as follows:

```
CWS (forecast for 2013 = 7727; 2013 observed return = 12147)
SNO (forecast for 2013 = 3161; 2013 observed return = 3294)
STL (forecast for 2013 = 1328; 2013 observed return = 854)
```

## Appendix L: Progress reports for individual projects funded in 2013 under the Coded Wire Tag Improvement Program

## LIST OF APPENDIX L TABLES

Appendix L 1. Canadian coded wire tag (CWT) project expenditures for 2013-2014, approved in
February, 2013.............................................................................................................. 138
Appendix L 2. US CWT Project Expenditures for 2013-2014, approved in February, 2013..................... 160

## 2013 Canada Project Reporting

Canadian FY 2013 was the last year of funding for Canadian coded wire tag implementation team (CWTIT) projects. Summaries for projects conducted in 2013 are below.

Appendix L 1. Canadian coded wire tag (CWT) project expenditures for 2013-2014, approved in February, 2013.

| Party | Project Category | TR25 Issue | Project Title | Cost |
| :---: | :---: | :---: | :---: | :---: |
| Can. | Increased CWT marking of CN indicators | 2 | Incremental tagging of 13 Indicator Stocks (Robertson Creek, Cowichan, Big Qualicum, Quinsam, Lower Shuswap, Nicola, Chilliwack, Harrison, Taku, Stikine, Kitsumkalum, Atnarko, and Philips) ${ }^{1}$ | \$347,600 |
| Can. | Increased deadpitch CWT recovery effort, all indicators | 5 | Increased effort in CWT recovery in indicator escapement programs (Quinsam, Cowichan, Big Qualicum, Harrison, Nicola, and Atnarko) ${ }^{1}$ | \$64,500 |
| Can. | Uncertainty in estimates of escapement or terminal fishery catch | 1, 6 | Atnarko Chinook CWT Indicator Stock ${ }^{1}$ | \$110,000 |
| Can. | Agency staffing <br> (Programmer, Catch QA/QC <br> Analyst, CWT Recovery <br> Coordinator) | $\begin{gathered} 4,6,7,8 \\ 9,10,11 \\ 13 \\ 14,15,17 \\ 18 \end{gathered}$ | Regional CWT Data System <br> Programming, Regional CWT and Catch Estimation QA/QC, Regional Sport and First Nations Fishery CWT Recovery Coordination, and Salmonid Enhancement Database Improvements ${ }^{1}$ | \$325,000 |
| Can. | Increased head recovery costs | 2, 4, 5, 7 | CWT Head Lab Processing and Data Management ${ }^{1}$ | \$200,000 |
| Can. | Low sample rates in terminal fisheries, sport and First Nations CWT recovery improvements | $\begin{gathered} 4,7,9,10 \\ 11 \end{gathered}$ | Regional Commercial, Sport and First Nations Fishery CWT Recovery Improvements ${ }^{1}$ | \$277,900 |
| Can. | Low sample rates in terminal fisheries, First Nations fishery CWT recovery improvements | 4, 10 | Improvements in CWT Recovery in Terminal First Nations Fisheries ( Fraser River and Bella Coola) ${ }^{1}$ | \$85,000 |
| Can. | Low sample rates in terminal fisheries, First Nations fishery CWT recovery improvements | 4, 10 | Improvements in Catch Estimates and CWT Recovery in Terminal Recreational Fisheries ${ }^{1}$ | \$10,000 |
| Can. | Uncertainty in catch estimates and CWT expansions, data management | 10 | MRP Archive Data Recovery ${ }^{1}$ | \$20,000 |
| Can. | Low sample rates in terminal and highly mixed stock fisheries | 4, 7 | Equipment Purchase | \$60,000 |
|  |  |  | Canada Total | \$1,500,000 |

[^7]Project title: Increased Coded Wire Tag (CWT) Marking of 9 Chinook Indicators
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 277,600$
Total CWTIT funding approved to date (if funded previously): \$1,385,100
Continued CWTIT Funding Needed (yes, no, maybe): Yes
Objectives and Relationship to PSC Technical Report 25: Issue 2 (Determination of tagging levels)
Project Description, Accomplishments, Results and Deliverables: This project involved increasing CWT application and release levels on nine Chinook indicator stocks in British Columbia in order to meet precision objectives in the estimation of fishery-specific exploitation rates. Tagging levels were set based on recent survival and fishery sampling rates in order to achieve stated precision objectives. The indicator stocks that received increased tagging through this project were:

1. Robertson Creek
2. Cowichan River
3. Big Qualicum River
4. Quinsam River
5. Chilliwack River
6. Harrison River
7. Nicola River
8. Lower Shuswap River
9. Atnarko River
10. Kitsumkalum

Increased tagging was initiated on selected stocks prior to brood year 2009 (e.g., Quinsam) through other external funding sources, but comprehensive increases in tagging levels began across all stocks in brood year 2009.

To date, CWT release targets have been met for all stocks in all brood years, save for the Cowichan River in brood years 2009, 2010, and 2013 when poor escapements or flooding prevented collection of adequate broodstock for full release targets. Infrastructure improvements at DFO hatcheries that were funded through the first year of CWTIT continue to allow expanded tagging to be completed on an annual basis. Returns and catches of marked three and four-year-old adult Chinook salmon to Salmonid Enhancement Program hatcheries in 2012 and 2013 from the first three years of expanded tagging have been strong, indicating that increased CWT recoveries are likely to be observed in future years as the releases from the expanded marking continue to mature and enter the various fishery and escapement strata.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program include increased CWT recoveries in all fishery and escapement strata for the nine Chinook indicators, which will allow for increased precision in the estimation of exploitation rates in the various fishery strata.

Success: This project has been successful. The increase in tags applied has resulted in direct benefits in the precision of estimates of catch and escapement. Continued funding will be required to maintain current marking levels, otherwise marking will return to pre-2009 levels.

Project title: Taku Chinook Fishery Monitoring and Coded Wire Tag (CWT) Application
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 30,000$
Total CWTIT funding approved to date (if funded previously): \$120,000
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25 Issue 2 (Determination of tagging levels)
Project Description, Accomplishments, Results and Deliverables: This project funded the application of CWTs to wild outmigrating Taku Chinook salmon juveniles and sampling and recovery of CWTs from a directed Chinook salmon fishery established in 2005. In 2013, 5,500 wild smolts were tagged but there was no directed fishery to sample.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Prior to CWTIT funds being applied to this program the fishery was not sampled. Lack of information on the fishery impacts reduced DFO's ability to evaluate exploitation rates and refine the Taku Chinook salmon escapement goal. Over the period of CWT Improvement funding, fishery sampling rates of 20-70\% have been achieved. This is the sole funding source for tagging wild Taku Chinook salmon. Without continued support, emigrants will not be tagged and the fishery will not be sampled-impacting PST requirements to monitor the fishery and determine exploitation rates.

Success: Yes, however additional data will be available when C tagged fish return.

```
Project title: Stikine River Chinook Coded Wire Tag (CWT) Application and Tag Recovery
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: \(\$ 30,000\)
Total CWTIT funding approved to date: \(\$ 120,000\)
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 2 (Determination of tagging levels)
```

Project Description, Accomplishments, Results and Deliverables: The objective of the project was to increase the CWT tagging and recovery levels of Stikine River Chinook salmon smolts. The specific tagging objective was an additional 35,000 Chinook salmon smolts annually. This project also funded sampling of adult returns to the Stikine River for CWTs.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: In 2013, a record 48,500 wild Stikine Chinook salmon smolts (including a key Little Tahltan stock grouping) were tagged. In addition, approximately $2 \%$ were measured for weight and length. Since the application of CWT Improvement funds, approximately $75 \%$ of the inriver fishery catch and approximately $30 \%$ of the US marine fishery catch were sampled for CWTs. Prior to CWT Improvement funding, sampling rates on Stikine River Chinook salmon were in the order of 20\%.

Without continued support, CWT marking and fishery sampling rates will be significantly reduced, compromising the reliability of the CWT statistics (low precision in the CWT estimation) and stock specific estimates. Since the sunset of the CWTIT program in 2014, sampling rates declined to $30 \%$. Some escapement monitoring continues (i.e., at the Little Tahltan weir and Verrett River spawning grounds).

Loss of CWT improvement resources impacts PST requirements to monitor fisheries (i.e., reduced CWTs in US fisheries to determine exploitation rates and lack of information to evaluate/refine Chinook salmon escapement goal).

Success: Yes the project has been a success; however, additional data will be available when existing tagged CWT fish return.

Project title: 2012-2013 Phillips River Chinook escapement estimation and increased Coded Wire Tag (CWT) application
Program Agency: Fisheries and Ocean Canada (DFO)
Approved funding for this cycle: $\$ 10,000+150,000$ CWTs
Total CWTIT funding approved to date: $\$ 48,000$
Continued CWTIT Funding Needed: Yes. Based on the recent success and increased CWT tag releases it will be key to maintain the program to ensure the recoveries of those tags in the escapement in future years.
Objectives and Relationship to PSC Technical Report 25: Issue 2 (Increased CWT marking of indicators), Issue 6 (Uncertainty in estimates of escapement or terminal fishery catch)

Project Description, Accomplishments, Results and Deliverables: There were two main objectives of this project:

1. Increase the number of CWT tag releases to 150,000 for this population.
2. Develop a mark-recapture program on a Mainland Inlet Chinook salmon population to provide accurate and precise estimates of tagged and untagged Chinook salmon escapement.

This project involved a two-stage mark-recapture of adult Chinook salmon returning to the Phillips River. Tags were applied via typical broodstock collection events and other seining in pools in the lower river and in pools above the lake in the upper river. Deadpitch activities were conducted throughout the watershed.

There was a significant improvement in the number of tags applied in 2013 relative to 2012; however, low river flows and increased bear activity resulted in a decrease in carcass recovery and precision for the 2013 estimate. It was also determined that the clipped contribution to the return was estimated at $22.6 \%$ ( $11.6 \%$ in 2012).

Escapement estimates have shown variable precision over the last three years of the study and brood collection in 2013 will result in the 150,000 CWT application target being met this spring for the 2014 release.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program include the following:

1. The development of a low cost indicator program for a Chinook salmon population in the poorly monitored Mainland Inlet Area of the Southern BC coast appears feasible.
2. Over the duration of this project it has been demonstrated that we can achieve a precise estimate of Chinook salmon escapement to the Phillips River as well as clipped contribution.
3. This project has demonstrated that an increase in CWT tag releases to the level of 150,000 is achievable in this remote location.

Project title: Regional Coded Wire Tag (CWT) Data System Programming
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: \$90,000
Total CWTIT funding approved to date: \$440,000
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 13, 14, 15, 17, 18 (Timeliness of reporting, incomplete/no exchange of CWT data, Inter/intra agency coordination, Updating CWT data difficulties, Inadequate CWT validation)

Project Description, Accomplishments, Results and Deliverables: This project involved hiring a programmer/analyst to provide systems analysis, design and programming support to the DFO CWT program system - the Mark Recovery Program (MRP). Prior to CWTIT funding, DFO had 1 full-time programmer/analyst performing MRP development and support. This was inadequate to keep up with technology and CWT program change requirements. The objectives for the 5 -year funding period were to re-engineer the DFO system using current database and web development software to develop new programs to accomplish the following:

1. Improve data through improvements to validation, corrections to data, and corrections to historical algorithms.
2. Improve data management through new data entry interfaces to the central database.
3. Improve access to information for DFO users and exports to the Regional Mark Information Centre.
4. Improve interfaces with DFO hatcheries system, catch monitoring system, and escapement systems.
5. Perform system modifications for new data sources from other CWTIT projects.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This is the fifth and final year of funding an additional programming position to support improvements to the MRP system. Prior to CWTIT funding, DFO had a significant backlog of programming issues and was not able to meet the bilateral reporting requirements effectively, as the MRP system was a legacy Fortran system originally developed over 25 years ago. With this additional resource, DFO made significant progress in reviewing old algorithms, converting the legacy system using current technology, and developing new interfaces to improve access to the information within DFO. This has allowed DFO to meet bilateral exchange deadlines and to make improvements to data quality. Because of the rewrite of the system, it will also be more cost effective for DFO to maintain and respond to change requirements in the future. While the majority of new development work is completed, there remain opportunities to improve the efficiencies of the Canadian CWT program such as developing the capacity to digitally scan CWTs and data collection forms into an indexed archive as part of the data entry process, and integrate technology such as data logging using hand-held devices or netbooks for the collection of sampling data.

Project title: Regional Sport and First Nations Fishery Coded Wire Tag (CWT) Program Coordination
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 85,000$
Total CWTIT funding approved to date: $\$ 411,400$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issues 4, 7, 9, 10, 11 (Low sample rates in terminal fisheries, Low sample rates in highly mixed stock fisheries, Nonrepresentative sampling, Incomplete coverage of fisheries or escapements, Voluntary sport fishery sampling program)

Project Description, Accomplishments, Results and Deliverables: This project involved hiring a senior fisheries technician to implement fisheries sampling improvements within DFO recreational and First Nations fisheries. Objectives are listed below.

1. Develop protocols and implement sampling programs to adequately represent First Nations fisheries.
2. Develop and implement program improvements to increase participation in the recreational voluntary head recovery program to increase sample rates representatively.
3. Provide technical support including design of standard operating protocols and/or infrastructure; review, implementation, and QA/QC for all aspects of CWT sampling within recreational and First Nations fisheries.
4. Promote and facilitate delivery of improvements to catch monitoring and sampling participation through communications or promotional materials.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This is the fifth and final year of funding a fisheries technician position to make improvements to DFO sampling of recreational and First Nations fisheries. Prior to CWTIT funding, DFO had one CWT program fisheries technician to support sampling of all DFO fisheries (commercial, recreational, test and First Nations). With the addition of a second fisheries technician, DFO has made significant progress in improving sampling across all CWT fishery sampling programs in terminal areas and in mixed stock fisheries. With the increased workload associated with the oversight and delivery of recreational and First Nations sampling programs, continued funding in future years is essential to ensure that gains achieved are maintained across all DFO fishery sampling programs.

Terminal Native economic opportunity fishery sampling targets were met for Robertson Creek (Nuu-chah-nulth), BC Interior/Kamloops Lake (Secwepemc Fisheries Commision and Siska Traditions Society), and the West Coast Vancouver Island mixed stock fishery (T’aaq-wiihak). Terminal Native food, social and ceremonial fisheries sampling targets were met for Atnarko River and Robertson Creek (Hupacasalth and Tseshaht). Sampling programs were introduced and progress towards sampling targets has been made for Cowichan River, Lower Shuswap River and Harrison River indicator stocks.

Recreational Improvements can be generally viewed by reviewing the impressive increases in recreational samples since this project commenced in 2009 compared to historical results.

Project title: Coded Wire Tag (CWT) Head Lab Processing and Data Management
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: \$200,000
Total CWTIT funding approved to date: $\$ 507,000$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issues 2, 4, 5, 7, 9, 10, 11, 12 (Tagging levels, Low sample rates in escapements, Low sample rates in terminal fisheries, Low sample rates in highly mixed stock fisheries, Nonrepresentative sampling, Incomplete coverage of fisheries or escapements, Voluntary sport fishery sampling program, Sampling to facilitate mark selective fishery evaluations)

Project Description, Accomplishments, Results and Deliverables: This project was required to pay for increased cost to ship, dissect, and perform data entry for increased quantities of head recoveries from DFO commercial, test, recreational and First Nations fisheries and escapement sampling programs. Funding was also used to develop new processes to improve efficiencies in the head lab such as introducing barcoded head labels and reviewing and modifying standard operating procedures. Increases in quantities of heads are attributed to the implementation of other CWT improvement projects including the following:

1. Increased tag rates in fisheries as a result of bilateral increases to tagging (Issues 1-3).
2. Increased escapement CWT recovery efforts (Issue 5).
3. Increased sampling rates, in commercial, test or research fisheries (Issue 4, 7).
4. Introduction of First Nations sampling programs (Issue 4, 7, 9).
5. Improvements to Voluntary Sport Head Recovery Program, resulting in increased sampling rates (Issue 4, 7, 11).
6. Introduction of sampling of freezer troll vessels in BC fisheries to improve representative sampling in this fishery (Issue 11).
7. Sampling of unmarked Chinook salmon (double index tagged fish) to support assessment of mark selective fisheries (Issue 12).

Head Dissections of Commercial, First Nations and Sport samples in DFO Head Lab.

|  | 1980 | 1985 | 1990 | 1995 | 2000 | 2002 | 2004 | 2006 | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Commercial | 30226 | 26226 | 32301 | 15095 | 1734 | 9173 | 11595 | 6033 | 4486 | 4132 | 5094 | 4776 | 6348 | 4757 |

| Sport | 9824 | 15494 | 7731 | 3061 | 2671 | 5071 | 5584 | 4604 | 5782 | 11869 | 14127 | 13888 | 18167 | 22026 |
| Chinook | 1658 | 1797 | 1897 | 2023 | 1384 | 2938 | 2911 | 3270 | 4073 | 6259 | 11563 | 8868 | 11609 | 12776 |
| Coho | 8166 | 13697 | 5834 | 1038 | 1287 | 2133 | 2673 | 1334 | 1709 | 5610 | 2564 | 5020 | 6558 | 9250 |
| Grand Total | 40050 | 41720 | 40032 | 18224 | 4405 | 14271 | 17376 | 10784 | 10334 | 16126 | 19300 | 18816 | 25123 | 27552 |

Improvements can be generally viewed by reviewing the impressive increases in head recoveries since this project commenced in 2009 compared to historical results. Note that this table and graph does not include escapement samples (approx. 8,000 from 2009 to 2011, approx. 10,000 in 2012, approx. 14,000 in 2013).

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This project ensures that funds and effort spent to complete other projects that increase tag recoveries of indicator stocks result in timely CWT data to support analysis. With increased head recoveries across all DFO CWT recovery programs, continued funding will be required in future years. This project also resulted in significant gains relative to the cost and throughput of samples in the DFO head lab to dissect, read and perform data entry. The cost per sample was reduced to between $\$ 4$ and $\$ 6 /$ sample (depending on source of sample), including overhead for lab space and equipment.

Project title: Regional Commercial, Sport and First Nations Fishery Coded Wire Tag (CWT) Recovery Improvements
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 277,900$
Total CWTIT funding approved to date: $\$ 862,900$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issues 4, 7, 9, 10, 11, 12 (Low sample rates in terminal fisheries, Low sample rates in highly mixed stock fisheries, Nonrepresentative sampling, Incomplete coverage of fisheries or escapements, Voluntary sport fishery sampling program, Sampling to facilitate mark selective fishery evaluations)

Project Description, Accomplishments, Results and Deliverables: This project is a portfolio of many projects being delivered throughout DFO fisheries to make strategic improvements to CWT sampling programs and CWT data. The focus of these projects is to make improvements that can be delivered during the increased CWTIT funding period to provide a legacy of improvements that can be sustained in the future, and to maintain sampling rates at required levels. Projects include the following:

1. Expand equipment to facilitate increases in recreational and First Nations sampling (i.e., freezers, freezer boxes, closed containers for brine solution).
2. Develop a communication strategy with recreational and First Nations fishers - participations in meetings, public relations events, etc.; and develop and distribute of communication or promotional materials.
3. Onsite review of existing sampling programs in all fisheries sectors and introduction of QA/QC through ongoing audits.
4. Review, development, and production of improved data collection materials (forms, labels, sample kits).
5. Introduction of sampling of freezer troll vessels in $B C$ fisheries to improve representative sampling in this fishery.
6. Replacement, repairs, and upgrades to sampling infrastructure requirements such as electronic sampling equipment or sampling tables for commercial fisheries
7. Deploy staff to increase service levels for pick-ups of heads from recreational and First Nations fisheries and maintain commercial fishery sample rates at required levels.

Improvements can be generally viewed by reviewing the impressive increases in head recoveries shown since this project commenced in 2009 in the tables provided under the DFO CWT Head Lab Processing and Data Management project (previous project summary).

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This project has made improvements in the quality and quantity of CWT data that is available for use in analysis across all DFO fishery sectors. Ongoing funding is required to sustain improvements to meet required sample rates and for life-cycle replacement of equipment. Specific Improvements to sport fishery sample rates follow.

| Sport Fishery Sample Rates | 2000-2004 period | $\mathbf{2 0 1 0} \mathbf{- 2 0 1 2}$ period |
| :--- | :---: | :---: |
| Haida Gwaii/Queen Charlottes | $13 \%$ | $46 \%$ |
| West Coast Vancouver Island | $13 \%$ | $24 \%$ |
| Georgia Strait North | $31 \%$ | $37 \%$ |
| Georgia Strait South | $23 \%$ | $27 \%$ |
| Juan de Fuca | $20 \%$ | $22 \%$ |

Project title: Salmonid Enhancement Program Coded Wire Tag (CWT) Head Data Coordinator/Archival CWT Database Review
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 75,000$
Total CWTIT funding approved to date (if funded previously): \$142,000
Continued CWTIT Funding Needed (yes, no, maybe): No
Objectives and Relationship to PSC Technical Report 25: Issues 10, 13, 15 (Intra-agency coordination, Timeliness of reporting, Uncertainty in catch estimates and CWT expansions, Data management)

Project Description, Accomplishments, Results and Deliverables: This project funded the staffing of a term biologist position in the Regional Salmonid Enhancement Program sector within DFO for 12 months. 2013/2014 was the second year for this project, which had two main objectives:

1. Develop a formal set of Best Practices for the collection, transfer and management of CWT heads and data at all escapement projects. This includes serving as a Regional Head Data Coordinator for all escapement programs on an in-season basis.
2. Review archival escapement data from DFO enhancement programs to ensure standardized analytical techniques and data verification procedures have been employed.

Through the Regional Head Data coordinator role, this project served to provide a single point of contact to lead the annual program to collect CWT heads and deliver them to the dissection lab in a timely manner. In the course of this project, a thorough review of the current data and head transfer program was conducted, efficiencies were identified, and a complete set of Best Practices was developed with the goal of improving data quality and delivery time, reducing costs at the dissection lab, and streamlining operations for current DFO staff. The development of Best Practices in the first year of this project led to ongoing implementation work in Year 2, and will result in lasting efficiencies through ongoing implementation at all escapement projects and at the head dissection lab.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Improvements in CWT data sharing from escapement projects directly benefit the CWT program by ensuring escapement data from the most recent return year continues to be made available in time for annual CTC CWT analysis in late winter. In addition to ensuring that complete and accurate datasets are provided for analysis, improvements made in the delivery and CWT dissection system serve to reduce costs in future years for processing of escapement heads. These savings will help to offset pressures from increased CWT recoveries expected as an outcome of the CWTI program, and will provide lasting improvements in the quality and timeliness of CWT reporting.

Success: Overall this project has been successful. Significant progress has been made on both key objectives in this project, with completion and implementation of the Best Practices. Due to a staffing change midway through Year 2 of this project, there were challenges in maintaining ongoing CWT Program support for a short period in 2013. The position was filled shortly afterwards, but there were impacts on the deliverables for this project, specifically objective 2. It was recognized at the beginning of this project that review of all CTC indicator data would not likely be completed in the first year of this project. The staffing change resulted in a focus on the highest priority objective and a reduction in progress on objective 2.

```
Project title: Mark Recovery Program (MRP) Archive Data Recovery Project
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $20,000
Total CWTIT funding approved to date: $40,000
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 13, 14 (Timeliness of reporting,
Incomplete/no exchange of CWT data)
```

Project Description, Accomplishments, Results and Deliverables: This project involved hiring part-time staff to review over 40 years of archived material associated with the DFO CWT program. The objectives for the funding were as follows:

1. Create an inventory of archived material.
a. Review and classify.
b. Identify gaps in DFO CWT information system vs source documents or CWTs.
c. Identify data recovery projects.
2. Develop a strategy for retention. Options include data recovery/data entry, digital conversion of paper forms, archive with retention requirements established, redistribute to appropriate existing DFO staff, or destroy.
3. Perform priority data recovery, digital archival of all historical paper forms.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This project resulted in digitization of all historical sources of data (such as recoveries from commercial, sport, test, research, or First Nations fisheries) and identification of data or fields on data records that have never been entered into the CWT system. This project also resulted in the development of new protocols for digital management of DFO CWT program records which will improve access to data for QA/QC in the future. Finally, the reduction of archived material has eliminated future expenditures by DFO for the management of large quantities of archive material and allow for these funds to be spent on CWT program delivery.

```
Project title: Operational Support for Recreational Coded Wire Tag (CWT) sampling projects
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $25,000
Total CWTIT funding approved to date: $94,000
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 4, 7, 9, 10, }11\mathrm{ (Low sample rates in
terminal fisheries, Low sample rates in highly mixed stock fisheries, Nonrepresentative sampling,
Incomplete coverage of fisheries or escapements, Voluntary sport fishery sampling program)
```

Project Description, Accomplishments, Results and Deliverables: This project involved hiring a seasonal junior fisheries technician to support the implementation of fisheries sampling improvements within DFO recreational fisheries. This position was supervised by the senior fisheries technician (Regional Sport and First Nations Fishery CWT Recovery Coordination project). Objectives were as follows:

1. Perform audit inspections and recommend improvements to Voluntary Sport Head Recovery Program Depots in Southern BC.
2. Implement specific recreational fishery sampling improvement projects in Southern $B C$ to adequately represent recreational fisheries.
3. Perform public relations and communication with Voluntary Sport Head Recovery Program Depots or fishers in Southern BC.
4. Perform $Q A / Q C$ to improve recreational sampling data.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This is the third year of funding seasonal fisheries technicians to make improvements to DFO sampling of recreational fisheries. Prior to CWTIT funding, DFO had one CWT program fisheries technician to support sampling of all DFO fisheries. With the addition of a second fisheries technician and seasonal staff, DFO has made significant progress in improving sampling through the voluntary sport head recovery program.

Project Title: Campbell/Quinsam Chinook Mark-Recapture Improvements (assess bias in random mixing of carcass mark-recapture)
Project agency: Fisheries and Ocean Canada
Approved funding for this cycle: $\$ 7,500$
Total CWTIT funding approved to date: $\$ 37,500$
Objectives and Relationship to PSC Technical Report 25: Issue 5 (Low sample rates in escapement)

Project Description, Accomplishments, Results and Deliverables: CWT improvement funding was used to increase the stream area sampled for CWTs, specifically the Second Island Channel in the Campbell River (2009-2013), allowing more access to carcasses in deep pools. In addition, this project assessed the assumption in a carcass mark-recapture that the tagged and untagged carcasses mix randomly in the population. Two methods were employed and compared.

1. Carcasses were tagged and placed back where they were found (random mixing unlikely unless there was some sort of flood event after that placement).
2. Carcasses were marked and then placed into the flow of the river.

Population estimates derived using the old method were 1-16\% less than new method except in 2011 ( $16 \%$ more). In recent years we had three very dramatically different flow conditions in order to evaluate the various release methods. Additional sampling effort and expanded spatial coverage contributed an increase in CWT recoveries on the Campbell River with only a slight reduction in sampling rate on the Quinsam River. The old method was discontinued after 2012 and the new method was been adopted. In 2013, the resources were directed at additional spatial and temporal sampling effort.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program include an improvement in the accuracy and precision of the mark-recapture estimates of escapement, and increased sampling effort and spatial coverage on the more challenging component of the system resulted in higher CWT recoveries on the Campbell River.

Project Title: Improved Coded Wire Tag (CWT) Recovery, Harrison River Indicator Stock Program Project agency: DFO
Approved funding for this cycle: $\$ 16,000$
Total CWTIT funding approved to date: \$80,000
Objectives and Relationship to PSC Technical Report 25: Issue 5 (Sampling rates in escapement)

Project Description, Accomplishments, Results and Deliverables: This project provided funding for additional effort to expand marking and recovery effort during Harrison River Chinook salmon markrecapture study, thus increasing the sampling rate and precision of the mark-recapture estimates.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: It is difficult to quantitatively assess success due to the annually variable rates of recovery resulting from different escapements of multiple species and annually variable environmental conditions. Sampling rates are dependent on the number of carcasses present, the prevalence of carcasses of other species, fluctuating water levels, predators, and a host of other factors. Carcass sampling rates on the Harrison River tend to be hindered by high water levels and large escapements of chum salmon, which result in considerable extra effort being required to find and recover carcasses of Chinook salmon. Increased Chinook salmon carcass recoveries result from the increased sampling effort, thus improving CWT recovery rates. The relationship is not linear so at any escapement level, the net benefit will differ, but proportional benefits are greater in years of more unstable flows and larger chum salmon returns.

Project Title: Cowichan Chinook Assessment Enhancements
Project agency: DFO
Approved funding for this cycle: \$30,000
Total CWTIT funding approved to date: $\$ 150,000$
Objectives and Relationship to PSC Technical Report 25: Issue 5 (Sampling rates in escapement), Issue 6 (Uncertainty in estimates of escapement or terminal fishery catch), Issue 10 (Incomplete coverage of escapement areas)

Project Description, Accomplishments, Results and Deliverables: The objective of this project was to improve escapement effort and survey coverage, biosampling rates, estimates of Chinook salmon mark rates, and improve head recoveries from escapement to the Cowichan River. Escapement sampling was improved by hiring a third crew of three technicians to collect deadpitch data for the Cowichan Chinook Assessment Project. This improved escapement sampling complements increased tagging rates in Cowichan Chinook salmon. The additional crew allowed for monitoring of Chinook salmon spawning activity and deadpitch activities in more areas within the Cowichan River, outside of the main spawning reaches. In addition, a data entry technician was hired to keypunch field data from the counting fence, the deadpitch, and the broodstock removals.

In 2013 the fence was installed on September 9, later than the usual start date of Labour Day (September 3). Water levels were sufficient at the start of the enumeration fence operation and fence activities proceeded normally until the final weekend in September when a rain event increased the discharge to 100 cubic meters per second, more than twice the capacity of the fence. The fence did not recover from this event and was removed on October 21 when water flows decreased to safe levels.

With a fence count unattainable, the estimate of natural spawners was based on a carcass markrecapture program, which was enhanced by the presence of a third deadpitch crew. Two crews began the deadpitch program on October 30, and a third crew was added on November 18. All three crews
worked until the end of the project on December 12.
In 2013, 1080 carcasses were sampled, resulting in 926 scale samples, and 210 adipose fin clipped Chinook salmon (198 heads collected and submitted for processing). During the period when three crews were active, 872 carcasses were sampled, indicating that without the third crew 290 (approx. 1/3 of 872 ) may not have been sampled. Overall, $16 \%$ of the mark-recapture estimate of 6680 adults and jacks natural spawners were sampled by deadpitch crews. This rate was also enhanced by the low water conditions in November and December.

Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program and PSC Salmon Management include improved estimates of escapement to the Cowichan, improved escapement survey coverage, biosampling and head recovery rates, all of which providing increased certainty of CWT statistics.

Success: Overall this project was successful in improving escapement survey effort and coverage, biosampling rates, estimates of Chinook salmon mark rates, and recovery of Chinook salmon escapement to the Cowichan River.

Project Title: Improved Coded Wire Tag (CWT) Recovery, Nicola River Indicator Stock Program Project agency: DFO
Approved funding for this cycle: $\$ 8,000$
Total CWTIT funding approved to date: $\$ 32,000$
Objectives and Relationship to PSC Technical Report 25: Issue 5 (Sampling rates in escapement)

Project Description, Accomplishments, Results and Deliverables: This project provided funding for contracting additional staff to expand recovery effort and sampling frequency during the Nicola River Chinook salmon deadpitch. By increasing the frequency at which the entire 50 km of river are surveyed, sampling rate was increased as carcasses are sampled prior to predator removal, thus increasing the sampling rate and precision of the mark-recapture estimates.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: It is difficult to quantitatively assess success to the annually variable rates of recovery resulting from different escapements of multiple species and annually variable environmental conditions. Sampling rates are dependent on the number of carcasses present, predators and other factors. Carcass sampling rates on the Nicola River tend to be hindered at escapements less than 10,000 due to the effects of predators. Until predator response is saturated, increasing recovery effort yields increased carcass recoveries by increasing the chances of encountering carcasses before predators, thus improving CWT recovery rates. The relationship is not linear so at any escapement level, the net benefit will differ, but proportional benefits are greater at depressed escapements.

Project title: Atnarko Chinook Coded Wire Tag (CWT) Indicator Program: Uncertainty in estimates of escapement and terminal CWT catch
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 110,000$
Total CWTIT funding approved to date: $\$ 586,500$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issues 1, 4, 6, 10 (Representation of production regions, Low sample rates in terminal fisheries, Uncertainties in estimates of escapement or catch, Incomplete coverage of fisheries or escapement)

Project Description, Accomplishments, Results and Deliverables: This project began in 2009 with the objective to expand the Atnarko assessment program to a Central Coast Chinook salmon indicator (noted as lacking in Technical Report 25, no indicator stocks on the BC mainland between the Skeena and Fraser rivers). The only northern indicator, Kitsumkalum, is a stream-type stock; Atnarko is an ocean type stock. Annually the project included application of 250,000 incremental CWTs, sampling of the terminal commercial, sport, and First Nations fisheries, and reintroduction of a mark-recapture program to improve escapement estimates and CWT recoveries.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: The majority of CWTIT resources were used to generate an accurate and precise (mean CV $=9 \%$ ) estimate of escapement with high CWT sampling rates (mean $=19 \%$ ). The spawning escapement ranged from 6,000 to 27,000 adult Chinook salmon during 2009-2013. Terminal First Nation and commercial gillnet fisheries were sampled intensively, with respective mean sample rates of $86 \%$ and $45 \%$. During the early years, CWTIT resources supported the estimation of the terminal sport fishery catch and CWT sampling; however, extremely large floods in 2010 and 2011 caused major changes to the river and fishery access points rendering the creel survey method impractical. Subsequently, indirect catch monitoring methods have been used to estimate CWT recoveries in the terminal sport fishery.

Results for 2009-2012 annual escapement and terminal fishery monitoring programs were reported in TCCHINOOK (14)-1 v.2. The 2013 escapement mark-recapture program was successfully implemented. 1113 Chinook salmon were tagged, 5146 carcasses examined, and 185 tags recovered, providing a preliminary escapement estimate of 27,292 adults (CV 8.8\%). There were 728 CWTs observed in the spawning escapement. In 2013 there was a high level of program support and compliance within the First Nations terminal food, social, and ceremonial fishery. Favorable water levels resulted in greater effort and catch $(2,824)$. Greater than $31 \%$ of the First Nations food, social, and ceremonial fishery was sampled and 213 CWTs recovered. The 2013 Bella Coola commercial gillnet fishery caught 4450 Chinook salmon; CWT results are still pending.

Without continued funding, ongoing maintenance of the terminal mark-recapture program to estimate spawning escapement, terminal fishery sampling and incremental CWT application will not be possible. Incremental CWTs applied from 2009 to 2013 are still in circulation and the full benefits of increased tagging may not be realized in terminal fisheries and escapement without maintaining the incremental sampling programs.

Success: This project has been successful in improving the sample rates and precision in the estimation of CWTs in escapement and terminal catch.

Project title: 2013 Central Coast Chinook Mark-Incidence and Catch Estimation Program
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 10,000$
Total CWTIT funding approved to date: $\$ 27,500$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 10 (Uncertainty in catch estimates and CWT expansions)

Project Description, Accomplishments, Results and Deliverables: Historically mark rates from the Central BC sport fishery have not been available instead mark rates from other areas (global pooling) in DFO's Mark Recovery Program (MRP) have been substituted. The historical use of proxy mark rate and submission rate data in DFO's MRP to estimate Central BC sport fishery impacts has been problematic.

The objectives for this project included the following:

1. Obtain mark rate data for Central Coast sport fishery which is stratified both spatially and temporally from late June to late August when the majority of Chinook salmon are caught.
2. Develop independent catch estimates for Areas 7-9 by month using fisher boat launch trailer counts and creel survey data.
3. Determine the lodge underreporting bias for marked head submission by comparing logbook mark rates to those collected by DFO staff (Conservation and Protection officers).
4. Calculate submission rates for Central Coast sport fishery either through integration of data into MRP or independently.

Immediate benefits have been realized as a result of this program, including catch estimates for the previously unaccounted for independent angler (nonlodge based) component of the fishery, and data for calculation of Central BC (Area 7-10) submission rates as well as estimated expansion factors. The availability of these data has precluded the need to use mark rates from other areas (global pooling) in DFO's MRP.

Benefits to CWT Program and PSC Salmon Management: The observed submission rates during the past three years are higher than proxy data previously used in MRP, and corresponding expansion factors are believed to better represent Central BC sport fishing impacts on CWT stocks. This recreational fishery is a significant harvester of Chinook salmon (approx. 6,000 in 2012 and 2013). Appropriate expansion of CWT recoveries in MRP is required to produce consistent and reliable stockspecific fishery impacts.

Continuation of this project would not only provide reliable central coast submission rate data and estimated expansion factors in the future but would also yield insight into the variability of these data between years. Without an annual program to collect Central BC Chinook salmon mark rate and independent angler catch data, proxy data from other areas would once again be used in MRP to expand CWT recoveries. The deficiencies inherent with this method have been highlighted previously and were the primary reason for initiating this project in 2011.

Future program objectives include opportunity to reduce program cost and increase program efficiency as new methods for determining independent angler effort and CPUE information are developed. These could include the following:

1. Partner with the Wui'Kinuxv First Nations guardian program in Rivers Inlet to collect on water creel data.
2. Independent effort estimates may be determined solely via marina reservation records for Area 9.
3. Partner with local First Nations guardian programs to collect on water creel data, and additional land-based creel survey at Shearwater BC. Independent effort estimates in Areas 7 and 8 may be more efficiently collected with increased onground presence and interviews.

Success: Yes, based on improved catch estimates and stock- and fishery-specific impacts.

Project title: Lower Fraser Fisheries Alliance (LFFA) Coded Wire Tag (CWT) Recovery Improvements
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 25,000$
Total CWTIT funding approved to date: $\$ 105,000$
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 4 (Low sample rates in terminal fisheries), Issue 10 (Incomplete coverage of fisheries and escapement).

Project Description, Accomplishments, Results and Deliverables: The Lower Fraser Fisheries Alliance (LFFA) is an organization formed in March 2010 which has been empowered by its member First Nations from the mouth of the Fraser River to the Canyon (Lower Fraser Area; LFA) to establish a First Nation to First Nation (Tier 1) working relationship to address issues of common interest and work with the DFO toward resolutions for effective resource and fisheries management.

This project is a collaborative project between DFO and the LFFA to make improvements to CWT awareness and sampling in the LFA through the following activities:

1. Build understanding of the CWT program and the Salmon Head Recovery Program throughout the LFA by engaging First Nations leaders and communities.
2. Provide technical support to LFA First Nations monitoring organizations on the collection and provision of biological samples and high quality supporting data associated with the CWT program.
3. Develop a communication plan, identifying the audience, message, strategy, form, and timing of communication for First Nations in the LFA.
4. Develop communication presentations and products.
5. Provide communication, education and awareness sessions with LFA First Nations, targeted to First Nations Community leaders, fisheries managers, biologists and technical staff, and fishers.
6. Provide training in the collection of CWT biological samples and data to First Nations fishery monitoring programs to support and enhance existing First Nations fishery monitoring programs in the LFA.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This is the third year of a collaborative project between the LFFA and LFA DFO targeting improvements to CWT sampling in the area addressing low sample rates in terminal fisheries. Both this project and the related project, Operational Support for First Nations CWT Sampling, benefit the CWT program by increasing awareness within LFA communities, aiding monitoring organizations to implement changes and build tools to support CWT sampling and data collection, and increasing the number of head samples collected from fisheries. Quantitative results are shown in Tables 1-4 in the related project.

Project title: Operational Support for First Nations Coded Wire Tag (CWT) Sampling Projects
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 25,000$
Total CWTIT funding approved to date: $\$ 50,000$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 4 (Low sample rates in terminal fisheries), Issue 10 (Incomplete coverage of fisheries and escapement)

Project Description, Accomplishments, Results and Deliverables: This project provided funding for a seasonal technician to provide support to Lower Fraser Area (LFA) DFO and First Nations monitoring groups, targeting increased sampling of Chinook and coho salmon for CWTs and improving collection of supporting mark rate information. The objectives for this year's funding are as follows:

1. Continue to build the relationship between DFO and the Lower Fraser Fisheries Alliance (LFFA) around CWT sampling in First Nations fisheries.
2. Work with staff from the LFFA on initiatives to increase understanding of the importance of the CWT Program within the LFA First Nations communities and monitoring organizations.
3. Provide support to LFA DFO and First Nations in order to increase the number of head samples collected from LFA First Nations fisheries and work on improving the systems for collection and quality of data on mark rates from LFA First Nations monitoring programs.

## Qualitative and Quantitative (if appropriate for project) Benefits to CWT Program and PSC Salmon Management: This is the third year of a collaborative project between the LFFA and LFA DFO targeting

 improvements to CWT sampling in the area addressing low sample rates in terminal fisheries, and it was the second year funding was provided for DFO technical support. Both this project and the related LFFA funding provided in 2011-2014 benefit the CWT program by increasing awareness within LFA communities, aiding monitoring organizations to implement changes and build tools to support CWT sampling and data collection, and increasing the number of head samples collected from fisheries.As displayed in Tables 1-4 below, both the total number of samples collected and the temporal and spatial distribution of those samples continued to improve this season for Chinook salmon. In addition, DFO and First Nations staff on the fisheries observed an increased awareness of the program this season including multiple incidences of fishers having samples ready for collection by the sampler in advance of a prompt. Samples recovered from coho salmon fisheries continue to be challenging even though the departmental messaging about the importance of the program has been consistent to that of Chinook salmon.

Table 1: Summary of Chinook and coho salmon head submissions by area from Lower Fraser First Nations Food, Social and Ceremonial fisheries, 2010-2013.

| Area | Chinook |  |  |  | Coho |  |  |  |

Project title: Custom Sampling Table - Ucluelet Fisheries Plant (West Coast Vancouver Island)
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: $\$ 10,000$
Total CWTIT funding approved to date: $\$ 10,000$
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 7, 12 (Low sample rates in highly mixed stock fisheries, Sampling to facilitate mark selective fishery evaluations)

Project Description, Accomplishments, Results and Deliverables: This project involved the design and production of a set of custom CWT sampling tables to be integrated into a West Coast Vancouver Island Chinook salmon troll fishery offload location in Ucluelet, BC. In reviewing the offload procedures, the table design was developed collaboratively with the plant management to meet the requirements of the CWT sampling program to access $100 \%$ of the catch for each vessel, while respecting industry requirements for minimal footprint at the site, high throughput, and careful handling of the catch to maintain economic value.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Deployment of this new equipment has resulted in in long-term improvements to the sampling infrastructure at a primary West Coast Vancouver Island offload location and improvements in efficiency and reliability of CWT recoveries in the Canadian troll fishery catch monitoring program while reducing handling of fish. In addition, the custom tables were designed to allow the tables or plans to be re-engineered, with only minor modification, for other offload locations as may be required in the future.

```
Project title: Coded Wire Tag (CWT) T-wands
Project agency: Fisheries and Oceans Canada (DFO)
Approved funding for this cycle: \(\$ 50,000\)
Total CWTIT funding approved to date: \(\$ 50,000\)
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 7, 12 (Low sample rates in highly mixed stock fisheries, Sampling to facilitate mark selective fishery evaluations)
```

Project Description, Accomplishments, Results and Deliverables: This project involved the replacement of CWT hand-held detection equipment for commercial fisheries sampling programs with the new Northwest Marine Technology T-wand to increase Canada's ability to accurately and efficiently sample CWTs in highly mixed stock fisheries with mass-marked Chinook salmon present.

The funding supported the purchase of 18 T-wands, with DFO in-kind trade-in of 18 working old blue hand-held wands.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Deployment of this new equipment has resulted in improvements in efficiency and reliability of CWT recoveries in Canadian catch monitoring programs while reducing handling of fish, costs for processing and transportation.

## 2013 US Project Reporting

A total of 12 US projects were funded in FY 2013 (Table L2). The total expenditure of US CWTIT projects in 2012 was $\$ 1,500,000$. Below the table are summaries for each individual project, including a description of the project, deliverable benefits to the CWT system, and the issue covered in PSC Technical Report 25 (PSC 2008).

Appendix L 2. US CWT Project Expenditures for 2013-2014, approved in February, 2013.

| Project Category | TR25 Issue | Project Title | Cost (\$USD) |
| :---: | :---: | :---: | :---: |
| Replace outdated CWT equipment | 12, 13 | Replace WDFW Outdated Handheld CWT Wand Detectors ${ }^{1}$ | \$248,543 |
| Low sample rates in mixed stock fisheries | 7 | Sampling Washington Ocean Salmon Fisheries ${ }^{1}$ | \$354,492 |
| Low sample rates in mixed stock fisheries | 7 | SEAK Sport Catch Sampling ${ }^{1}$ | \$57,367 |
| Indicator hatchery stock tagging, terminal fishery and escapement numbers, and sampling | 1, 3, 4, 6 | Mid-Oregon Coast CWT Recovery, and Escapement of Elk River Fall Chinook ${ }^{1}$ | \$125,195 |
| Replace outdated CWT equipment | 13 | Purchase of Reading Stations at Alaska CWT Lab | \$29,304 |
| Reduce head processing costs and improve sampling efficiency | 4, 7, 13 | SEAK Commercial Port Sampling of No Tags ${ }^{1}$ | \$58,164 |
| Replace outdated CWT equipment | 12, 13 | Replace 30 ODFW Outdated Handheld CWT Wand Detectors | \$101,063 |
| Purchase new CWT equipment | $\begin{gathered} 13,14,17 \\ 18 \\ \hline \end{gathered}$ | Purchase Data Loggers for 10 Hatcheries for Tag and Release Data Electronically and Train Staff | \$99,653 |
| Administrative | 19 | Partial Funding for Co-Chair | \$14,820 |
| Indicator stock tagging of wild stock without hatchery representation | 1, 2 | Chilkat River Chinook Smolt CWT ${ }^{1}$ | \$86,801 |
| Indicator stock tagging of wild stock without hatchery representation | 1, 2 | Stikine River Chinook Smolt CWT— Bilateral $^{1}$ | \$134,562 |
| Low sample rates in mixed stock fisheries | 7, 8, 12 | Improvements to Oregon Ocean CWT Sampling in CR Management Area | \$112,597 |
| CWT Lab equipment purchase and sampling | 7,10,13 | Purchase of T-Wands, Reading Station and Fishery Sampling-Makah Tribe | \$46,459 |
| CWT Lab and sampling equipment purchase | 7,13 | Purchase of T-Wands and Reading Station-Lummi Tribe | \$12,607 |
| Administrative-CWT meeting costs | 19 | PSC—Fund Costs of Next 2 CWTIT Workshop | \$13,200 |
| Purchase new CWT equipment | 7,13 | Purchase of Dissection and Reading Stations-Stillaguamish Tribe | \$5,173 |
|  |  | GRAND TOTAL | \$1,500,000 |

[^8]Project Title: Coded Wire Tag (CWT) Field Equipment Replacement—Handheld Wands
Project agency: WDFW, John Kerwin
Approved funding for this cycle: \$248,543
Total CWTIT Funding approved to date: \$479,269
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 12 (Sampling methods to facilitate sampling of mark selective fisheries and CWT processing), Issue 13 (Timeliness of reporting)

Project Description, Accomplishments, Results and Deliverables: WDFW has approximately 500 CWT detection wands in current inventory. The WDFW sampling database lists approximately 240 sampling locations where Chinook and coho salmon are sampled for CWTs. Additionally, streams and rivers in every major river basin, as well as all WDFW hatchery facilities are surveyed annually for Chinook and coho salmon that contain CWTs. All of these locations require the necessary equipment to allow for adequate sampling of both marked and unmarked CWT-tagged fish. The purchase of 85 CWT detection wands represents the first influx of the new technology and significantly more sensitive wands for WDFW samplers to utilize.

During 2013, WDFW purchased 85 hand held wands of the new design developed by Northwest Marine Technology in 2011. These wands were utilized at port sampling locales that have high numbers of Chinook salmon sampled. Because there are unreliable CWT detection wands at other locations, WDFW will make an assessment of the CWT detection wands turned in by samplers at ports and other field sites, and use the most useful to replace the unreliable CWT detection wands. For example, some wands have been retrofitted with shields while others have not. WDFW will replace nonretrofitted wands with reliable retrofitted wands.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: There is increased accuracy of detecting CWTs in sampling using handheld wands. Some increase in speed and efficiency of sampling should be realized as well.

Success: Yes, the wands were purchased and will be used for the 2014 season for Washington fisheries.

```
Project title: Sampling Washington Ocean Salmon Fisheries
Project agency: Washington Department of Fish and Wildlife
Approved funding for this cycle: $354,492
Total CWTIT funding approved to date: $1,031,900
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Improving sample rates in mixed stock
fisheries
```

Project Description, Accomplishments, Results and Deliverables: This project addresses the priority activity identified by the CWTIT for improving sampling rates in highly mixed stock fisheries (fisheries with multiple stocks). This project is an ongoing activity of the Washington Department of Fish and Wildlife that was supported by funding provided by the United States federal government (Anadromous Fish Grant - Public Law 304).

The ultimate use of these data is to determine harvest rates, stock composition and compliance with Pacific Salmon Treaty obligations for the United States, as well as to provide data used to forecast or estimate impacts of fisheries on various stocks. Fishery managers use these determinations to optimize the two goals of protecting weak stocks and providing recreational and commercial harvest opportunities.

Sampling rates in the 2013 Washington ocean recreational fishery remained well above the minimum $20 \%$ goal at $37 \%$ for Chinook and $39 \%$ for coho salmon. In the 2013 Washington non-Indian commercial troll fishery, rates of $45 \%$ on Chinook and $34 \%$ on coho salmon were maintained. The sampling encounter rate on CWT tagged fish increased notably in 2013; a total of 4,300 Chinook salmon CWTs and 4,600 coho salmon CWTs were recovered. Additionally, onboard and dockside Chinook salmon DNA samples totaled 2,600 in the recreational fishery and 1,850 (dockside only) in the non-Indian troll fishery.

Continued funding will be required to maintain current sampling levels. Without CWTIT funding, sampling rates are likely to fall below $20 \%$.

```
Project title: SEAK Sport Catch Sampling
Project agency: Alaska Department of Fish and Game
Approved funding for this cycle: $57,367
Total CWTIT funding approved to date: $195,358
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Improving sample rates in mixed stock
fisheries
```

Project Description, Accomplishments, Results and Deliverables: This project addresses the priority activity identified by the CWTIT for improving sampling rates in mixed stock fisheries (fisheries with multiple stocks). This Southeast Alaska (SEAK) regional project is an ongoing activity of the Alaska Department of Fish and Game, Division of Sport Fisheries, which was also supported by funding from federal funds (Dingle-Johnson) and other PSC funds, and this CWTIT money helps cover additional sampling.

This catch sampling data for the SEAK sport fisheries of Chinook and coho salmon is used to determine stock composition of the harvest, and compliance with Pacific Salmon Treaty obligations. The CWT recoveries provide important temporal and spatial information to fishery managers, help with estimating harvest rates by the various fisheries (including the sport fishery), and ultimately help with the sustained management of these important salmon resources.
The objectives of this project were to improve the sampling rates of sport harvested Chinook salmon in Juneau and Ketchikan, and to maintain the 20\% sampling rate of Chinook salmon in Craig. Preliminary estimates indicate that unfortunately the sampling rates in 2013 were still low in Juneau ( $13.0 \%$ ) and Ketchikan (10.4\%) for 2013. Efforts and considerations to improve these sampling rates are ongoing. In 2013 we did maintain the $20 \%$ or above sampling rate for Chinook salmon at Craig (21.7\%).
Revised preliminary sampling rates in the 2013 SEAK marine recreational fishery for the region was slightly below the minimum 20\% goal at $18.2 \%$ for Chinook salmon and $19.6 \%$ for coho. A total of 9,798 Chinook and 61,073 coho salmon were examined for CWTs, with 651 Chinook and 994 coho salmon CWT being recovered. The 2013 sport fish SEAK CWT recovery information can be downloaded from the ADF\&G Mark and Age Determination website. Additionally, a total of 4,204 Chinook salmon were sampled for genetic tissue from the SEAK marine recreational fishery.
Continued funding will be required to help work towards improving and maintaining target sampling levels.

```
Project Title: Mid-Oregon Coastal Production Region Coded Wire Tagging, Recovery and
Escapement Estimation of Elk River Fall Chinook Salmon
Project agency: Oregon Department of Fish and Wildlife
Approved funding for this cycle: $125,195
Total CWTIT funding approved to date: $501,379
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 1 (Inconsistent and incomplete
representation of production regions by CWT indicator stocks)
```

Project Description, Accomplishments, Results and Deliverables: The Oregon Department of Fish and Wildlife is evaluating the appropriateness and feasibility of using the Elk River hatchery production of fall Chinook salmon as an exploitation rate indicator stock for the Mid-Oregon Coast aggregate. Due to funding shortfalls, this aggregate has been underrepresented in the PST CWT program for fisheries management. There is currently only one other exploitation rate indicator stock on the Oregon coast; it is located in the North Oregon Coast aggregate. Over the last three years with CWTIT program support, we have boosted the number of ad-clipped and CWT smolts released from Elk River Hatchery to over 200,000 . This level of tagging should be attainable with this year's project as well. Brood stock collection has just begun on the Elk River for 2013.

In addition to tagging, with CWTIT program funding we have implemented a complete terminal tag recovery program consisting of terminal fishery evaluation, spawning ground surveys, and hatchery intake sampling. Our efforts for 2013 are just getting underway. During the previous three years, we were able to generate precise and accurate estimates of terminal catch, enumerate and sample hatchery swim-ins, and estimate hatchery and wild spawning escapement. These data will be used in combination with future return and harvest data to evaluate the utility of the Elk River hatchery stock as an exploitation rate indicator Stock.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Increased and consistent tagging levels result in more CWT recoveries and subsequent higher levels of precision in all fishery and escapement strata evaluated through PSC management. Appropriate levels of staffing for terminal tag recoveries result in more accurate and precise estimates in all terminal strata. This will provide us the data to evaluate the utility of the Elk River hatchery stock to represent the Mid-Oregon Coast aggregate.

Through the first three years of funding we purchased new NMT CWT detection wands and data loggers with UPC scanning capabilities. The data loggers have improved the efficiency and accuracy of data collection through the use of programmed dropdown menus and scripts to limit and to field check data entry. Data are regularly uploaded to central servers. There, the data can be reviewed by project staff for accuracy and to highlight any possible protocol issues. We estimate approximately 120 person* hours annually are saved through this process. The Elk River stock is a late returning stock with fish spawning through February. Therefore, a timely turnaround of data is crucial to incorporating these data and estimates into local and international fisheries management.

```
Project title: ADF\&G Mark, Tag, and Age Lab Coded Wire Tag (CWT) Reading Station Upgrades Project agency: Alaska Department of Fish and Game
Approved funding for this cycle: \$29,304
Total CWTIT funding approved to date: \$29,304
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Equipment purchases to improve CWT data collection, accuracy, and timeliness
```

Project Description, Accomplishments, Results and Deliverables: The CWT reading stations at the Alaska Department of Fish and Game's Mark Tag and Age Laboratory were based on obsolete 30-year old closed-circuit television technologies and need to be replaced. If a workstation broke, it could not be repaired or replaced because the parts are out of date and unavailable. The loss of a single closed-circuit television reading station would translate to a significant loss in reader productivity (e.g., fewer CWT reads per day). Consequently, all reading stations needed to be upgraded before this issue became problematic.

We replaced eight CWT reading stations with a digital imaging system that consists of a dissecting microscope equipped with a digital video camera and a hi-resolution LCD monitor for viewing and reading CWTs. Four of the systems have $8^{\prime \prime}$ monitors and four have $10 \prime$ monitors. The digital imaging systems were purchased, installed, and integrated into Mark Tag and Age Laboratory operations in early October.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Reading CWT tag codes directly from a high-resolution monitor is easier, more accurate, and more efficient than reading them through a low-resolution TV monitor. Unlike closed-circuit television, LCD displays do not have screen flicker which reduces eyestrain and fatigue and ultimately increases reader productivity and data quality. Unlike our previous reading stations, output from the digital imaging system can be sent directly to the lab's networked computers so that we can capture, store and send images of CWT codes. This added capability helps us confirm codes on CWTs prior to release, read difficult CWT recoveries, and verify previously read codes - all of which contribute significantly to the generation of quality data.

Recovery and identification of CWT codes is part of Alaska's obligation to treaties and agreements made as participating members of the PSC. These data play a key role in satisfying domestic agreements and international treaties, specifically with regards to the US-Canada Salmon Treaty obligations involving resource allocation and management of transboundary stocks. The Mark Tag and Age Laboratory serves as Alaska's centralized resource for tracking and managing salmon resources using CWTs and is therefore an integral part of the coordinated coastwide CWT program regulated and monitored by the PSC.

Project title: SEAK Commercial Port Sampling No Tags
Project agency: Alaska Department of Fish and Game
Approved funding for this cycle: $\$ 58,164$
Total CWTIT funding approved to date: $\$ 304,616$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 7 (CWT Tagging and Sampling Issues)
Project Description, Accomplishments, Results and Deliverables: Southeast Alaska has relied on visual sampling of adipose clipped fish to recover CWTs for over three decades and has provided high-quality data for regional and PSC analytical and management purposes. However, since 1995, an increasing
percentage of adipose clipped Chinook salmon without tags (No Tags) have been recovered in the Southeast Alaska Troll fisheries. The escalating presence of No Tags in Southeast Alaska fisheries has led to a decrease in CWT sample rates by statistical week and area. The effects of No Tags also include an increase in sampling time, shipping costs, tag detection/decoding time, and loss of revenue to seafood processors and direct marketers.

In an effort to increase or maintain CWT sample rates and decrease shipping costs, this project provided funding for four Fish and Wildlife Technicians in the ports of Sitka, Craig, and Wrangell and one Fishery Biologist in the port of Sitka.

During the summer troll fishery in 2013 Alaska Department of Fish and Game commercial port samplers examined over 30,000 Chinook salmon for the presence or absence of the adipose fin. Port samplers used NMT T-wands to check for the presence of a CWT in those fish observed as having a missing adipose fin. Port samplers applied standard CWT sampling protocol to those fish missing an adipose fin that signaled positively as having a CWT implanted in the head and recovered the heads of these fish from seafood processors. Over 5,000 Chinook salmon harvested in the Southeast Alaska summer troll fishery were observed to be missing their adipose fin, and 1,817 of those positively signaled as having a CWT. Sampling rates for each of the four troll fishery quadrants in Southeast Alaska increased in the Southern Outside and remained above the coastwide standard of 20\% in the Southern Inside, Northern Inside, and Northern Outside.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program include the increased sampling rate in the Southern Outside quadrant of the Southeast Alaska. Sampling rates in other areas of the 2013 Southeast Alaska summer troll fishery were maintained above the $20 \%$ coastwide standard. This increases the precision in the estimation of exploitation rates in the various fishery strata and other statistics needed for PSC management. The use of the electronic tag detection wand benefits the CWT Program as less salmon heads were recovered, bagged, and shipped to the ADF\&G Mark, Tag, and Age Laboratory. This also benefits the industry as more fish were available for the head-on market and therefore mitigated the loss of revenue to seafood processors and buyers.

Project title: Replace Outdated Handheld Coded Wire Tag (CWT) Wand Detectors - 30 Wands
Project agency: Oregon Department of Fish and Wildlife
Approved funding for this cycle: $\$ 101,063$
Total CWTIT funding approved to date: $\$ 181,773$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 12 (Sampling methods to facilitate sampling of mark selective fisheries and CWT processing), Issue 13 (Timeliness of reporting)

Project Description, Accomplishments, Results and Deliverables: With the approved 2013 funding, ODFW purchased a second lot of 30 new T-wands. The first 10 T-wands of the 2013 order were just delivered on November 8. The remaining 20 T -wands will be delivered in two lots before the end of December, 2013. The late delivery resulted from a large backlog of other T-wand orders received by Norhtwest Marine Technology this year. This did not prove to be a serious setback because the first 30 T-wands delivered in late 2012 were available for sampling Oregon's key ocean and Columbia River commercial and sport fisheries in the spring and summer months of 2013.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: The significantly higher sensitivity of the T-wands (depth approx. $5+\mathrm{cm}$ vs the old blue wands at approx. 3 cm ) will result in higher numbers of CWTs being detected in all fisheries, escapement back to the hatcheries, and
spawning grounds. This will be particularly true for the larger adult Chinook salmon sampled in the fisheries and elsewhere. T-wands also eliminate any further need to mouth wand adult Chinook salmon.

The new design of the T-wands allows samplers to grasp the wand just below the $T$ part of the wand. This results in balanced movement of the T-wand and basically eliminates the continuous wrist movement and associated stress injuries experienced with the old blue wands.

Project title: ODFW Coded Wire Tag (CWT) Database Program Support Systems Project agency: ODFW, Mark Engelking
Approved funding for this cycle: \$99,653
Total CWTIT Funding approved to date: $\$ 520,653$ on ODFW CWT Reporting System
Continued CWTIT Funding Needed: Yes for training and added functionality of the system
Objectives and Relationship to PSC Technical Report 25: Issue 13 (Timeliness of reporting), Issue 14 (Incomplete/no exchange of CWT data), Issue 17 (Updating data is difficult and updates cannot be tracked), Issue 18 (Validation is inadequate).

Project Description, Accomplishments, Results and Deliverables: There are several aspects to the project. The Agile Software Development process of adaptive and interactive software development was successfully used in the development of the CWT F application. The conversion of existing CWT data, reports, and processes for ocean fisheries to newer web-based technology (SQL c\#.net) used by the CWT F application has been completed. This conversion improves management of CWT data and reporting of recoveries. Migration of historic ocean fisheries, Marine Resources Program, information from the COBOL Mark-Recovery application to the CWT F application is being validated for accuracy. The CWT F application will be used exclusively in 2014. ODFW defined 85 development stories for transforming Ocean Recreational Boat Survey data from PC computer-based processes to web-based technology. The ocean troll (commercial) fisheries processes now are linked to the commercial fish ticket application. This allows total salmon catch and sample estimations in the commercial ocean fishery. Relevant reports are available and others are in development to manage the ocean fisheries. These reports to support the ocean fisheries programs are available for management in 2014.

Upload processes for Washington Columbia Treaty fisheries data have been developed and tested. These processes will be used in 2014 for recovery and effort data management of Washington information in the Columbia River commercial and sport fisheries reported by Oregon.

CWT recovery information through paper forms and the manual data entry processes for CWT recovery and release information from hatcheries are to be replaced in 2014 by programmed data loggers and netbooks, which will provide electronic data uploads to the CWT F application database. To this end equipment has been purchased and software has been developed. A programmed Psion data logger is used to capture CWT recovery data from several hatcheries (including Bonneville Hatchery) and upload it to the CWT F application. Preliminary testing indicated a better alternative to the data loggers at some other hatcheries was rugged netbooks (small portable laptop computers) using Excel spreadsheets to capture data. Parallel testing of the netbooks at Salmon River and Sandy River hatcheries is in progress. It appears that netbooks have the advantage of requiring little training and upload processes are available in CWT F for this data. Development for CWT release programs is ongoing. The Psion data loggers that are both durable in field conditions and compatible with Microsoft Mobile 6 software are also in use at Columbia River Management. All snout identification tickets now have 128-code bar codes which code for alphanumeric characters; this allows direct reading of the tickets through the integrated bar code scanner on the data loggers. They are in parallel test and when accepted and approved will be used for next year's data acquisition.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Timeliness of reporting, access and retrieval of CWT data, updating of CWT data is simplified, and validation and accuracy of CWT data from Oregon is improved by the CWT F. It will be fully implemented in 2014. Updates to the CWT F application from Regional Mark Information Centre data is now a one step process. Creation of export files of release, recovery, location and catch sample data is a one-step process reducing errors from file manipulation and corruption of data. Data description files are created in conjunction with the data files.

Success: Yes, the project is mostly complete. Additional functionality and training are required to improve access to analysts in ODFW and inclusiveness of other applications (Fish Tickets, Hatchery Management Information System, Research, and Willamette BiOP projects). Continued data grooming, report development and bug fixing (as needed) will be necessary to upgrade performance of the system.

```
Project title: Chilkat River Chinook salmon fall Coded Wire Tag (CWT) project
Project agency: The Alaska Department of Fish and Game
Approved funding for this cycle: $86,801
Total CWTIT funding approved to date: $275,635
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 1, 2 (Tagging and tagging levels)
```

Project Description, Accomplishments, Results and Deliverables: The Chilkat River is the third or fourth largest producer of Chinook salmon in Southeast Alaska. The Chilkat River Chinook salmon fall CWT project has been conducted since 2000. The same Chinook salmon brood year is also captured and implanted with CWTs the following spring. Conducting fall CWT projects significantly boosts the number of Chinook salmon implanted with CWTs that emigrate from the Chilkat River the following spring. Trapping areas in the Chilkat River drainage include the Tahini River, Kelsall River, and lower Chilkat River; trapping commences in mid-September and finishes in late October every year. Data produced from this project contributes towards estimating fall parr abundance, overwinter survival, smolt abundance, and marine harvest in mixed stock fisheries. The tagging goal of 22,000 has been reached in 11 of 13 years since 2000, and the fall mark fraction average for brood years 1999-2005 is 0.068.

For brood years 1999-2011, the number of Chilkat River Chinook salmon parr released with CWTs in the fall has averaged 28,332 compared to an average of 4,068 released in the spring. Average fall parr abundance for brood years 1999-2005 is 496,344 ( $\mathrm{SE}=72,183$ ), average overwinter survival is $34.3 \%$ ( $\mathrm{SE}=8.5 \%$ ), and average smolt emigration is 161,857 ( $\mathrm{SE}=40,071$ ). The average tagging fraction for brood years 1999-2005, represented by theta, is 0.096 , and fall tagging accounts for $71 \%$ of this mark fraction.

Tags released in the fall contribute towards estimation of marine harvest, total return, marine exploitation rates and smolt to adult survival. Marine harvest for brood years 1999-2005 has averaged 844 ( $\mathrm{SE}=324$ ), total return average is 4,707 ( $\mathrm{SE}=656$ ), average marine exploitation is $17.6 \%$ ( $\mathrm{SE}=4.1 \%$ ), and marine survival has averaged $3.2 \%$ (SE=0.8\%).

Data from the fall Chilkat River Chinook salmon CWT project contributes toward brood year production estimates, which is produced following the 7-year life cycle (through age-1.5 fish) of Chilkat Chinook salmon. These data are published through the ADF\&G Fishery Data Series and are readily available to fishery managers throughout Alaska, British Columbia, and the Pacific Northwest.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Because the fall CWT project produces the majority of Chinook salmon with CWTs leaving the Chilkat River annually, operation of this project is essential to accurately estimate important parameters which aids fishery
management. Chilkat River Chinook salmon is a PSC indicator stock and contributes towards management of the Southeast Alaska sport fishery allocation in accordance with the Pacific Salmon Treaty.

Benefits to the CWT program include increased CWT recoveries in mixed stock fisheries and full run reconstruction for the Chilkat River Chinook salmon indicator stock. CWTs implanted during the fall project greatly increases the precision in the estimation of exploitation rates in commercial, sport, and subsistence fisheries, and produces other statistics needed for PSC management.

Project Title: Stikine River Chinook Smolt Coded Wire Tag (CWT)
Project agency: ADF\&G (note this project is also funded by Canada), Phillip Richards
Approved funding for this cycle: $\$ 134,562$
Total CWTIT Funding approved to date: $\$ 491,527$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: Issue 1 (Incomplete representation of production regions), Issue 2 (Determination of tagging levels)

Project Description, Accomplishments, Results and Deliverables: This bilateral project was designed to represent the Stikine River population of Chinook salmon, which averages run sizes of about 50,000 adults, and to increase the level of CWT tagging of smolts to 35,000 or more annually. In addition, approximately $2 \%$ were measured for weight and length. The tagging goal has been reached each year. Returning adults are sampled in marine fisheries, with most CWTs recovered in SEAK sport, gillnet and troll fisheries near Petersburg; fewer numbers are recovered in other areas of SEAK and NBC. The escapement and inriver fisheries are sampled to determine the marked rate by brood year, which provides a basis to estimate harvest contributions, exploitation rates, smolt and adult abundance, and survival rates. The US has paid the bulk of funding for the CWT portion of this program since its inception. Canada has paid for the bulk of escapement recoveries since its inception.

Continued CWTIT Funding Needed: Yes. Tagging rates could not have been achieved without this funding source.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: This program, along with the inriver run and escapement estimation program (funded by other sources) provides the tools to forecast and manage the terminal run of this stock per Chapter 1 of the 2009 Pacific Salmon Treaty Agreement.

Success: Yes; and additional data will be available when recently tagged broods recruit to fisheries in the future.

Project Title: Improvements to Oregon Ocean Coded Wire Tag (CWT) Sampling of Commercial Troll and Recreational Fisheries in the Columbia River Ocean Salmon Management Area
Project agency: Oregon Department of Fish and Wildlife, Eric Schindler
Approved funding for this cycle: $\$ 112,597$
Total CWTIT Funding approved to date: $\$ 313,834$
Continued CWTIT Funding Needed: Yes, and other funding preferred
Objectives and Relationship to PSC Technical Report 25: Issue 7 (Low sampling rates in highly mixed stock fisheries), Issue 8 (Uncertainty in estimates of catch in high mixed stock fisheries), Issue 12 (Sampling methods to facilitate sampling of mark selective fisheries and CWT processing)

Project Description, Accomplishments, Results and Deliverables: The primary objectives of this project (initially begun with the 2011 ocean salmon fishing seasons) have been to implement full electronic sampling for CWTs, and to maintain the minimum required CWT sampling rate of $20 \%$ with emphasis on Chinook salmon in Oregon's ocean salmon fishery in the Columbia River Ocean Salmon Management Area. Implementation of this required a uniform approach for the entire Oregon ocean salmon fishery.

The objectives have been met and the project has been a success to date, although overall catches during the period have remained below historic levels and some challenges to maintaining sampling rates in the commercial salmon fishery have yet to be faced. In the 2013 ocean commercial troll salmon fishery, we recovered readable tags from 332 unmarked Chinook salmon ( 25 from the Columbia River Area), and these tags would not have been recovered without the support from CWTIT. An unexpected benefit has been the recovery of tags from unmarked Chinook salmon that were supposed to have been marked (missed clips or regenerated adipose fins may be the cause). Based on the tag recoveries from California stocks these unclipped recoveries of Chinook salmon made up approximately $1 \%$ of the total recoveries.

Tag recoveries from PSC stocks accounted for $44 \%$ (troll) and 61\% (sport) of the CWT estimated hatchery stock contribution in the Columbia River Management Area in 2013, while only 17\% (troll) and 11\% (sport) of the estimated contribution from the fisheries South of Cape Falcon were from PST managed stocks. Nonclipped CWT Chinook salmon made up a decreasing percent of the CWTs recovered to the South, but still made up approximately $4 \%$ of the CWT recoveries south of Cape Falcon.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Coastwide, the implementation of full electronic sampling increased the recovery of CWTs by approximately $5 \%$ as a result of the recovery of nonclipped CWT Chinook salmon. Furthermore, tag recoveries from nonclipped CWT Chinook salmon in the Columbia River Area accounted for $17 \%$ of the total recoveries from the area. These recoveries were composed primarily of stocks from the Snake River and Central and Upper Columbia River. Without full electronic sampling, these recoveries would have been missed.

Success: Continued employment of full electronic sampling was successful in 2013 and sampling rates were maintained above the $20 \%$ objective coastwide. Seasonwide Chinook salmon sampling rates in the Columbia River Management Area were $41 \%$ for the commercial troll fishery and $42 \%$ for the recreational fisheries. South of Cape Falcon, Chinook salmon sampling rates were $27 \%$ for the commercial fisheries and $34 \%$ for the recreational fisheries.

Project title: Staff Support and Purchase of Equipment for Coded Wire Tag (CWT) Lab
Project agency: Makah Tribe
Approved funding for this cycle: $\$ 46,459$
Total CWTIT funding approved to date: $\$ 51,771$
Continued CWTIT Funding Needed: Yes
Objectives and Relationship to PSC Technical Report 25: 7.1.3. Sampling Issues for Highly Mixed-Stock Fisheries

Project Description, Accomplishments, Results and Deliverables: This project involved acquisition of hardware for the tag lab, and for sampling. In addition, it provided funding for additional staff to increase sampling rates.

The hardware purchased includes the following items:

1. Stand to stabilize the video microscope acquired in 2012 and used in reading tags.
2. T-wand to improve scanning fish for tags.
3. Pneumatic head-corer to speed up the process of extracting tags from heads.
4. Air compressor to power the head-corer.
5. Fume hood for ventilation in the tag lab.

Items 1 and 2 have been purchased and are in service in the CWT sampling program now.
Items 3 and 5 have been ordered and paid for, but we are awaiting delivery.
Item 4 has been purchased and delivered, but cannot be put into service until Item 3 is delivered and installed.

Staff support included hiring an assistant sampler during the summer salmon fishing season, and funding for additional pay for the port sampler.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits already realized for the CWT program include increased sampling rates for both coho and Chinook salmon, compared with the rates in 2012, when the sampler did not have an assistant. Sampling rates for Chinook salmon increased from $33 \%$ in 2012 to $36 \%$ in 2013. For coho salmon, the sampling rates increased more dramatically, from $18 \%$ in 2012 to $32 \%$ in 2013. These increased sampling rates improve the precision in the estimation of exploitation rates in the Makah Tribe's fisheries. They will also provide Makah fishery management staff and other agency staff with more information on the stock composition of Makah Tribe's mixed stock fisheries. Finally, it will provide additional information used in cohort reconstruction and other stock assessment work.

Benefits expected from the hardware acquisition include more efficient processing of head in the tag lab, and more efficient reading of the tag codes. The latter benefit has already been partially realized by the purchase and operation of the video microscope in 2012, but we expect it to be further improved by the stand that will stabilize the microscope and the image of the tag on the video screen.

```
Project title: Lummi Coded Wire Tag (CWT) Equipment Acquisition
Project agency: Lummi Natural Resources Department
Approved funding for this cycle: \$12,606
Total CWTIT funding approved to date: \$12,606
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 13, 14, 15 (Timeliness of reporting, data exchange, interagency coordination)
```

Project Description, Accomplishments, Results and Deliverables: Lummi Natural Resources (LNR) aimed to build upon its previous capacity for the detection, collection, reading and reporting of CWTs taken from Chinook and coho salmon fisheries in Lummi's terminal fishing area. Funding received as part of this proposal has been used to acquire essential equipment and supplies for CWT sampling and processing, allowing for reliable CWT recovery data to be made available to the coast wide CWT program in a timely manner.

The harvest management division of LNR has utilized CWTIT funds to improve its salmonid harvest sampling program in an effort which has contributed reliable CWT recovery data to be used in the management of salmon stocks within Lummi's usual and accustomed fishing grounds. Lummi is the prominent fishing tribe participating in the mixed stock fisheries of Salmon Management Areas 7 and 7A, highlighting the need for enhancing the department's capacity for CWT sampling. As such, LNR requested and received funding for equipment upgrades and acquisitions. Specifically, LNR purchased two T-wands, one CWT jig, one CWT illuminator, and one video microscope. Such investments in equipment and supplies have helped ensure LNR's comanaging participation in sampling salmon harvests from area 7 and 7A fisheries for 2013 and beyond.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: Benefits to the CWT program include increased CWT recoveries in Regional Mark Information Centre region Northern Washington, increased turnaround time in reading and reporting tag results, and more involvement for the tribal comanagers in managing salmon fisheries.

```
Project title: Purchase of detection and reading station-Stillaguamish Tribe
Project agency: Lummi Natural Resources Department
Approved funding for this cycle: $5,173
Total CWTIT funding approved to date: $5,173
Continued CWTIT Funding Needed: No
Objectives and Relationship to PSC Technical Report 25: Issues 7 (Low sample rates in highly mixed
stock fisheries), Issue 13 (Timeliness of reporting)
```

Project Description, Accomplishments, Results and Deliverables: The Stillaguamish Tribe annually samples spawning grounds and fisheries within the Stillaguamish Watershed for Chinook and coho salmon CWTs. All told, more than 30 miles of Chinook salmon habitat and 10 miles of coho salmon habitat are sampled during the spawning season, along with several inriver fishery locations. Heads are collected at these locations and brought back to our office and frozen. At the end of the fishing and spawning seasons we dissect out the CWTs and read them in our new laboratory, which is in the process of being outfitted. The proper equipment is needed to adequately and accurately carry out CWT dissection, and our lab needed a V-reader to help with the process.

Therefore, the Tribe purchased a new V-reader from Northwest Marine Technology. It replaced an older wand that was no longer working well for CWT dissection purposes.

Qualitative and Quantitative Benefits to CWT Program and PSC Salmon Management: The new Vreader will increase speed and efficiency of dissecting CWTS, and improve detection rates (more sensitive than old wand it is replacing).

Success: Yes, the V-reader was purchased and was used for the 2014 season in the Stillaguamish.
