EXECUTIVE SUMMARY

This report reviews: 1) catch, effort, and management actions in the 1994 Northern Boundary Area pink, chum, and sockeye salmon fisheries of southern Southeast Alaska Districts 101 to 106 and northern British Columbia Areas 1, 3, 4, and 5; 2) management performance relative to Treaty requirements; 3) historical catches and escapements; and 4) preliminary 1995 expectations and fishing plans for 1995.

In southern Southeast Alaska, the all-gear salmon harvest was 28.0 million which is close to the 1980 to 1993 average of 28.8 million. The harvest was comprised of 21.1 (75.3%) million pink, 3.4 (12.2%) million chum, 1.7 (6.2%) million coho, 1.7 (6.1%) million sockeye, and 55 (0.2%) thousand chinook salmon. Pink salmon escapements were reasonably well distributed and near index goals in all southern Southeast Alaska districts. Escapement indices totaled 7.1 million or 1.1 million above the 6.0 million escapement target. Escapements of sockeye, chum, and coho salmon were generally strong throughout the region.

In Northern British Columbia, pink returns were very poor relative to recent years; 354,988 pink salmon were harvested in Canadian Area 3 and only 160,250 pink in the Area 4 fishery. Pink escapements to most areas were extremely poor. Sockeye returns were below average; 326,125 were harvested in Area 3 and only 555,229 in Area 4. Escapement levels for sockeye were near target for the Nass and Skeena Rivers. Escapements of summer chum salmon were relatively good in Area 3.

For the 1994 purse seine fishing season no formal agreement had been reached with Canada on the conduct of the District 104 fishery. However, this fishery was managed to limit fishing time and sockeye harvest to levels similar to the 1990 to 1993 annex arrangement under the Pacific Salmon Treaty. The total sockeye salmon harvest prior to Statistical Week 31 was 158,524 fish.

In the Alaska District 101-11 (Tree Point) gillnet fishery the U.S./Canada Pacific Salmon Treaty calls for an average annual harvest, beginning in 1985, of 130,000 sockeye salmon. The 1994 harvest of sockeye salmon at Tree Point was 100,377 fish. This brings the 1985 to 1994 average to 164,360 sockeye.

Under the Pacific Salmon Treaty the outside portions of Canada's Statistical Areas 3 and 5 are to be managed such that an average annual pink harvest of 900,000 is achieved. In 1994, 249,651 pinks were harvested in Management Units 3(1-4) and 5-11 combined. The current average annual pink harvest from 1985-1994 in the treaty area is 1,824,943.

As for Alaska's District 104 seine fishery, there were no specific annex arrangements under the Pacific Salmon Treaty governing the conduct of the Canadian Area 1 troll fishery for pink salmon. Preliminary saleslips indicate the Area 1 troll catch was 220,500 fish with 73,820 taken in the A-B line strip.

Weak harvests are forecast for Southeast Alaskan pink salmon in 1995. The Alaska Department of Fish and Game forecasts a harvest of between 15 and 25 million pink salmon in all of Southeast Alaska in 1995. Separate forecasts for northern and southern southeast are no longer made. Returns of coho

salmon are projected to be below recent year averages but returns of sockeye and chum salmon are projected to be comparable to the levels observed in recent years.

In Canada, average sockeye fisheries are anticipated in Area 3 and Area 4 in 1994, while lower than average pink catches are predicted.

INTRODUCTION

This report reviews the 1994 Boundary Area pink, chum and sockeye salmon fisheries of Southeast Alaska and Northern British Columbia and outlines preliminary expectations and fishing plans for 1995. The document is submitted to the Pacific Salmon Commission as required in Article IV of the Pacific Salmon Treaty. Weekly catch and effort data is provided by district/area, gear, and species for Northern Boundary Area fisheries from 1960 to 1994. Sub-area catch data is also presented for Canadian Areas (3-1), 3(2-4) and 3(7-17). Canadian catch data for 1994 is based on hail surveys as saleslip data is preliminary at this time. Maps showing the statistical fishing districts/areas for Southeast Alaska and Northern British Columbia are provided in Figures 1 to 5.

SOUTHERN SOUTHEAST ALASKA

1994 Salmon Forecast

Formal forecasts are not made for species of salmon other than pink salmon in Southeast Alaska. Alaska Department of Fish and Game forecasted a harvest of between 38 and 57 million pink salmon in all of Southeast Alaska in 1994. Separate forecasts for pink salmon in northern and southern Southeast Alaska were not made. The returns of sockeye, chum, and coho salmon to systems in southern Southeast Alaska were projected to be strong as they have been in recent years.

Review of the 1994 Fishing Season

Commercial fisheries harvested approximately 28.0 million salmon in southern Southeast Alaska in 1994, this includes purse seine, drift gillnet, troll, and hatchery harvests from Districts 101 through 108, 150 and 152, and the salmon harvests in the Annette Island Fishery Reserve. This 28.0 million salmon harvest is close to the 1980 to 1993 average of 28.8 million. The harvest was comprised of 21.1 (75.3%) million pink, 3.4 (12.2%) million chum, 1.7 (6.2%) million coho, 1.7 (6.1%) million sockeye, and 55 (0.2%) thousand chinook salmon. The pink salmon harvest in all of Southeast Alaska of 57.2 million was slightly above the forecast range of 38.0 to 57.0 million and the fourth highest harvest in history. An all time record 36.2 million pink salmon were harvested in northern Southeast Alaska. Pink salmon escapements were reasonably well distributed and near index goals in all southern Southeast Alaska districts. Escapement indices totaled 7.1 million or 1.1 million above the 6.0 million escapement target. Escapements of sockeye, chum, and coho salmon were generally strong throughout the region. Historical catch and effort data by district, gear, species, and week is presented in Tables 1-66.

District 104 Purse Seine Fishery

For the 1994 purse seine fishing season no formal agreement had been reached with Canada on the conduct of the District 104 fishery. The pre-season management plan for the district was to conduct the fishery in a manner which would limit the fishing time and sockeye harvest to levels similar to the 1990 to 1993 time period. This would limit the fishing time and harvest of sockeye salmon prior to Statistical Week 31. There were three weeks of fishing prior to Statistical Week 31 in 1993.

The 1994 season began on July 3 (Statistical Week 28) for a 10 hour opening. During this opening 11,868 sockeye were harvested by 35 purse seine boats. The District 104 fishery was not opened again in Week 28, although inside districts were opened for an additional 15 hours on July 8 as the northern Southeast fishery was experiencing record harvests of pink and chum salmon and most of the purse seine effort was located in the northern districts. On July 11 and 12 (Statistical Week 29) the district was opened for a two day split opening of 7 hours per day. The inside districts at this time were opened for a continuous 39 hour opening. During this split 14 hour opening 25 purse seine boats harvested approximately 19,000 sockeye, 33,000 pink salmon and 36,000 chum salmon. Another 8 hour opening was allowed on July 15 (Week 29). During the 8 hour opening 41 boats harvested approximately 22,500 sockeye, 36,000 pink salmon, and 25,000 chum salmon were. This brought the total sockeye harvest to date to approximately 49,000. A 15 hour opening was allowed on July 18. Fifty-two purse seine boats caught approximately 47,500 sockeye salmon, 92,000 pink salmon, and 40,000 chum salmon. Through July 18 approximately 101,000 sockeye had been harvested. With the department managing the district for a harvest of approximately 120,000 sockeye it was decided to re-open the fishery on July 21 for 8 hours. During the opening 57 boats caught 57,000 sockeye salmon, 153,000 pink and 25,000 chum salmon. This put the sockeye harvest prior to Statistical Week 31 at 158,524 fish.

Beginning on July 25 (Statistical Week 31) and continuing through the final day of fishing on August 29, the District 104 fishery was managed according to the strength of the pink salmon return. For the next three openings the purse seine fishery was opened for 15 hours on July 25, July 28, and July 31. This conservative management approach was the result of a smaller pink salmon return as compared to the last several years in southern Southeast Alaska. Beginning on August 8 through the end of the fishery on August 29 the pink returns were sufficient to allow a two-day-on/two-day-off fishing schedule. Effort levels in District 104 were generally below those in recent years due to a larger portion of the fleet harvesting a record number of pink and chum salmon in the northern Southeast Alaska districts.

The total season's harvest in District 104 of 12.5 million pink salmon was slightly above the 1985 to 1993 average of 12.0 million fish. The harvest of 1.1 million sockeye, 715,000 chum salmon, and 345,000 coho salmon were the largest harvest experienced in the district.

Districts 101, 102, and 103 Purse Seine Fisheries

The District 101 and 102 purse seine fishery opened for 15 hours on July 3 and again on July 8 (Statistical Week 28). These early openings were in response to a strong prediction, good early pink salmon escapements in the mainland rivers of District 101, and strong early pink harvest in some northern districts. During the first two weeks of the season, Statistical Weeks 28 and 29, pink salmon run strength was similar to previous years, with two 15 hour openings occurring during the first week, followed by a 39 hour and 15 hour opening the second week. During the remainder of the season, pink salmon run strength was below average in District 101, and fishing time and area was adjusted as the season progressed to ensure escapement goals were reached. Chum salmon catches were strong in District 101 during the first three weeks (Statistical Weeks 28, 29, 30) of the season, but dropped during the rest of the season. In District 102, pink salmon strength was below average during the later half of July, but picked up in early August and was average through the remainder of the season. Pink salmon escapement goals were exceeded in District 102. Chum salmon strength in District 102 were very strong and above average all season.

In District 103, the season started in Statistical Week 30 with a 15 hour opening. During this season, pink salmon catches were stronger than the parent year (1992), but average in strength when compared to previous seasons. Though escapement goals were exceeded in District 3, below average rain fall occurred late in the season and die-off of unspawned fish were observed in the northern portion of the district. Chum salmon strength was average, similar to recent years.

Tree Point Drift Gillnet Fishery

The Tree Point drift gillnet fishery opens by regulation on the third Sunday of June. During the early stages of the fishery, management is based on the run strength of the Alaskan wild stock chum and sockeye salmon and on the strength of the Nass River Sockeye salmon. Beginning in the third week of July when pink salmon stocks begin to enter the fishery in large numbers, management emphasis shifts to that species. By regulation, the District 101 Pink Salmon Management Plan begins on the third Sunday of July. The Plan sets gillnet fishing time at Tree Point in relation to the District 101 purse seine fishing time, when both fleets are concurrently harvesting the same pink salmon stocks. The U.S./Canada Pacific Salmon Treaty calls for an average annual harvest of 130,000 sockeye salmon.

In 1994, the gillnet fishery at Tree Point was opened for a four-day fishing week on June 19 (Statistical Week 26). Catches of chum salmon during the early weeks of the fishery, Statistical Weeks 26, 27, 28, 29 and 30, were at record levels. During this time period, 267,300 chum salmon were harvested. Sockeye salmon catches during this time were below average and though chum salmon catches were at record levels, the Department reduced fishing time and area to ensure sufficient numbers of sockeye salmon pass through the fishery for escapement needs.

Due to below average catches of sockeye salmon, the department fished only 3 days in Statistical Week 27. In Statistical Week 28, the fishing time was again held at three days due to below average catches of sockeye salmon and the southern end of the fishery was closed to fishing due to poor escapements of sockeye salmon in the Nass River. During Statistical Weeks 29, fishing time was held to three days. During this week, sockeye catches improved and a four day fishing week was announced for Statistical Week 30.

The fishery was managed according to the Pink Salmon Management Plan from Statistical Week 31 through Statistical Week 36, with the length of each opening based on a formula of fishing time allowed in the District 1 Purse Seine Fishery. In Statistical Week 31, due to below average pink escapements in early run systems, a two day opening was announced with a possible extension if pink escapements improved. At that time, the fleet was put on notice that even though the fishery was being managed according to the Pink Salmon Management Plan, if sockeye escapements to the Nass did not improve and the fishery was extended, the lower portion of the fishing area may be closed. Pink escapements did improve and the fishery was extended. The lower end of the fishery was not closed during this extension due to improved sockeye salmon escapements in the Nass River. While under Pink Salmon Management, four days of fishing time occurred in Statistical Week 31, with 5 days of fishing time being mandated by the plan from Statistical Weeks 32 through 35. In Statistical Week 36, a four day opening occurred. Pink salmon catches were average or below average during this time period. Sockeye catches were above average in Statistical Weeks 33, 34, 35, and 36.

Starting in Statistical Week 37, the fishery went on Fall management and was managed according to chum and coho salmon strength. For this week and the next two weeks, three days of fishing time was allowed. Coho salmon catches were above average during Statistical Weeks 29, 33, 35, 36, 37, and 39. Chum salmon catches during were above average during this time in Statistical Weeks 35, 37, 38, and 39. Due to strong coho and fall chum catches, two days of fishing time was allowed for Statistical Weeks 40 and 41.

Portland Canal was open to fishing this season due to the strong returns of chum salmon observed in the fishery.

The total harvest of sockeye salmon at Tree Point was 100,377 fish. This the second lowest year of sockeye harvest since 1985 (85,690 in 1990) and brings the average annual harvest since 1985 to 164,360 sockeye salmon.

Pink, Sockeye, and Chum Salmon Escapements

Pink salmon escapements were reasonably well distributed and near index goals in all southern Southeast Alaska districts (Table 67). Escapement indices totaled 7.1 million or 1.1 million above the 6.0 million escapement target. Escapements of sockeye, chum, and coho salmon were generally strong throughout the region.

Programs to estimate sockeye salmon escapements are only in place for two systems in southern Southeast Alaska, Hugh Smith and McDonald Lakes (Table 68). The sockeye salmon escapement to Hugh Smith Lake was approximately 8,958 based on weir counts and the results of a mark-recapture study. The informal escapement goal for Hugh Smith is 27,000. McDonald Lake's escapement is estimated to be 106,484 sockeye salmon based on an expansion of foot survey counts. This escapement is above the informal goal range of 70,000 to 85,000.

A weir was operated on Fish Creek at the head of Portland Canal to enumerate chum salmon for the fourth consecutive year. The 1994 weir count totaled 32,322 chum salmon compared to 9,916 in 1991, 46,771 in 1992 and 60,447 in 1993. The peak foot survey count of 9,535 chum salmon in Marx Creek was the highest on record since this spawning channel was constructed in 1985. Chum salmon escapements were strong in other Portland Canal area systems (Table 69).

Coded Wire Tag Releases

Coded wire tag mark-recovery programs provide information on migration routes and fishery contributions for hatchery and wild stocks in Southeast Alaska. Preliminary releases of coded wire tagged salmon in Southeast Alaska in 1994 are listed in Table 70.

Management Performance Relative to Treaty Requirements

District 104 Purse Seine Fishery

For the 1994 purse seine fishing season no formal agreement had been reached with Canada on the conduct of the District 104 fishery. However, this fishery was managed to limit fishing time and sockeye harvest to levels similar to the 1990 to 1993 annex arrangement under the Pacific Salmon Treaty. The total sockeye salmon harvest prior to Statistical Week 31 was 158,524 fish. The district was opened for a total of six days before week 31 and 23 days for the season.

District 101 Tree Point Drift Gillnet Fishery

The Treaty calls for an average annual harvest of 130,000 sockeye salmon in the Tree Point gillnet fishery. The preliminary estimate of total sockeye harvest in 1994 is 100,377 fish. This is the second lowest year of sockeye harvest since 1985 and brings the average annual harvest since 1985 to 164,360 sockeye salmon.

Year	Annual Harvest	Avg. Ann. Harvest
1985	172,863	172,863
1986	145,657	159,260
1987	107,595	142,038
1988	116,240	135,589
1989	144,936	137,458
1990	85,690	128,830
1991	131,492	129,210
1992	244,649	143,640
1993	394,098	171,469
1994	100,377	164,360

1995 Salmon Forecast for Southern Southeast Alaska

The 1995 pink salmon return to Southeast Alaska is expected to be weak. The Alaska Department of Fish and Game's preliminary forecast is for a harvest of between 15 and 25 million pink salmon in all of Southeast Alaska in 1995. This will be the second year in which individual forecasts for pink salmon returns to northern and southern Southeast Alaska will not be made. This year's prediction was the result of a subjective evaluation of the effect of a severe drought during the 1993 spawning season, rather than a formal model. The model which has been used successfully over the past few years was predicting a strong (38 to 57 million) harvest. However, the model does not include a parameter to account for drought-induced mortality, and consequently, its use was deemed inappropriate this year. A cursory evaluation of the 1994 pink salmon outmigration in southern Southeast did not find any areas of high pink salmon fry abundance, and large pre-spawn die-offs were noted in several major systems of southern Southeast in 1993.

Formal forecasts are not made for species other than pink salmon in Southeast Alaska. However, the returns of chum salmon are expected to continue to be strong since the dominant age class (4-year olds) will be from the same brood year in which pink salmon experienced exceptionally high survival (1991). The sockeye harvest is expected to be somewhat below the recent years average due primarily to the reduced seine fishing time which will be allowed in order to ensure adequate pink salmon escapements from a weak pink salmon return. The Coho harvest is expected to be substantially below the recent years average, because of the strong relationship ($r^2 = 0.71$) which exists between pink and coho salmon returns in Southeast Alaska since 1960.

NORTHERN BRITISH COLUMBIA

1994 Salmon Forecast

Area 1

Sockeye. There are no significant local sockeye stocks in Area 1. A catch of 50,000 Skeena and Nass sockeye was anticipated.

Pink. Local pink salmon were expected to produce a harvestable surplus of 300,000 in 1994. Passing stocks, particularly Skeena pinks, were expected to contribute to the catch as well.

Chum. A very small gillnet assessment fishery was expected in Masset Inlet.

Fishing Plans. A small fishery on Skeena-Nass bound sockeye and the local pink was planned with management based on the abundance of these stocks.

Area 3

Sockeye. An average sockeye return to Area 3 of 500,000 was expected which would provide for an Area 3 net catch of 280,000. In addition a catch of 200,000 Skeena sockeye was anticipated for a total catch of 480,000.

Pink. A below recent year average pink return of 600,000 was anticipated, providing an Area 3 catch of 225,000. In addition, 500,000 Skeena pink were expected to be caught in Area 3 net fisheries, for a total catch of 725,000.

Chum. Area 3 chum stocks remain depressed. No targeted catch was anticipated.

Fishing Plans. An above average sockeye fishery and a modest pink fishery was anticipated in Area 3 in 1994.

Area 4

Sockeye. The Skeena sockeye return was forecast to be 2,300,000 providing an Area 4 commercial net catch of 1,000,000.

Pink. The Skeena pink return was forecast at 2,300,000. This was well below the large returns in recent years and was expected to provide an Area 4 catch of 600,000.

Chum. Skeena chum escapements are severely depressed and chum are only caught incidentally.

Fishing Plans. In 1994, average sockeye fisheries were forecast for July, while pink salmon fisheries in August were planned to be lower than those in recent even-year fisheries. Domestic management initiatives to reduce the catch of coho, chum, chinook and steelhead will anticipated to be an important factor in management.

Area 5

Sockeye. A catch of approximately 10,000 local sockeye was predicted for Area 5. In addition, a directed fishery on Skeena stocks for a catch of 50,000 sockeye was also anticipated.

Pink. Local Area 5 pink stock forecasts were poor. However, Skeena pinks were expected to provide a catch of 100,000 in Area 5 bringing the total catch to 125,000.

Chum. Local chum stocks are depressed and no surpluses were anticipated.

Fishing Plans. Area 5 fishing patterns were expected to be based largely on the abundance of Skeena sockeye and pink.

Review of 1994 Fishing Season - Net and Troll Fisheries

Area 1

The Area 1 net fishery can be separated into two distinct fisheries. The fishery on passing stocks (July to mid-August) is concentrated in the Langara Island region off the northwest corner of the Queen Charlotte Islands. This is predominantly a seine fishery harvesting passing sockeye and pink salmon bound mainly for the Skeena River. Nass, Fraser and Southern Southeast Alaskan stocks are also caught incidentally. The second fishery (mid-August to October) concentrated in Masset Inlet and Naden Harbor is a gillnet and seine fishery for surplus local chum and even-year pink stocks. The weekly 1994 catch statistics for Area 1 gillnet and seine fisheries are provided in Tables 71 and 72. Effort data is expressed in the number of boats fishing during each opening, the hours fished, and the portion of 24-hour days represented by the hours fished.

Area 1 historical (1960-1994) weekly net catch data for passing and local stocks is outlined in Tables 73-78. Effort data is provided for years 1973-1994 in Table 79. A map of the local management subareas is included (Figure 4).

The 1994 Area 1 net fishery on passing stocks opened July 16 for gillnets and July 24 for seines. The fishery consisted of 15.8 gillnet days and 6.8 seine fishing days before closing August 24 for gillnets and August 16 for seines. The sockeye net catch totalled 98,911 and the pink catch 46,802.

The local chum and pink fishery showed relatively poor catches, totaling 2,053 chum and 24 pinks caught exclusively by gillnets during five net openings from August 24 to September 28.

Area 3

Management units (sub-areas) of Statistical Area 3 are outlined in Figure 5. In recent years, the Area 3 sockeye gillnet fishery has started in mid to late June. From 1963 to 1993 in-season escapement was determined by the Nass River gillnet test fishery, however in 1994 the test fishery was not conducted due to fiscal constraints. The decision was made to rely on escapement estimates provided by the Nisga'a fishwheel operations conducted in the lower Nass River approximately five miles upstream from the old Nass test fishery site. These fishwheels had been in operation since 1992 and showed promise as an estimator of abundance in both years they were conducted. In addition to the fishwheel estimates, catches in local Native food fisheries, and Canadian and Alaskan commercial fisheries were utilized in determining Nass sockeye run strength.

In general the Area 3 net fishery is managed for Nass sockeye salmon until mid-July after which the outer Area 3 fishery is managed based on Nass and Skeena pink and Skeena sockeye stock abundance. The inside Area 3 net fishery is managed for Nass sockeye, pink and chum abundances from mid-July to late August or early September.

Weekly 1994 hauled catch data by gear type for Areas 3(1-4), 7(7-17), sub-areas 3-11, 3-17 and total Area 3 are presented in Tables 80 to 89. Prorated historical (1963-1994) weekly catch information for gillnets and seines in sub-areas 3(-1), 3(2-4) and 3(7-17) and total Area 3 are provided in Tables 90 to 113. Annual effort data for Area 3 for the years: 1973-1994 are shown in Table 79. In addition, annual effort data for these same years for subareas 3(1-4) and 3(7-17) are provided in Table 114.

The 1994 gillnet and seine fisheries opened on June 14 and July 17 respectively. The season ended on August 31 for gillnets and August 15 for seines. For gillnets there was a total of 22.5 days fishing, while seines fished 9.0 days. The gillnet sockeye catch of 144,690 was relatively low because returns of Nass and Skeena sockeye to Canadian waters were poor. The Area 3 seine catch of 181,435 sockeye was also well below average reflecting the lower sockeye abundance. The catch of pink salmon by gillnets (50,156) and seines (304,832) was much lower than expected as all northern and central B.C. pink stocks returned at well below forecast levels. Of the total Area 3 pink net catch, 69.9 percent (248,053) was taken in outside management units 3(1-4). This is less than the pre-treaty (1973-1984) average of 74 percent. The total Area 3 seine effort of 698 boat days was well below the pre-treaty average (1973-1984) of 1,102 boat days. In 1994, 73.9 percent of the total seine effort was expended in management units 3(1-4), which is above the 1973-1984 pre-Treaty average of 68 percent.

Sockeye escapements to the Nass were at or near target for most stocks with 160,000 past the Meziadin Fishway and a very preliminary estimate of 200,000 for all of Area 3. The Nass fishwheels overestimated the escapement early in the season suggesting a final escapement in the order of 400,000. The overestimation was discovered by mid-July after which fishing times were severely restricted in the inner portions of Area 3 to increase the sockeye escapement.

Pink escapements to Area 3 are well below target for most stocks, similar to or less than those in recent even-year returns. Preliminary chum escapements to Area 3 were good in 1994. Table 115 presents very preliminary escapements for 1994, and Table 116 provides historical annual escapements for Area 3.

Area 4

Through negotiations of the Skeena Watershed Committee, a board comprised of native, commercial and sport representatives, a fishing plan was developed for 1994 to maximize sockeye harvest while addressing concerns for depressed Skeena coho and steelhead stocks.

Summaries of the 1994 gillnet and seine weekly catch and effort are provided in Tables 117 and 118. Area 4 historical weekly catch information by gear type for 1960-1994 is provided in Tables 119-124.

The Area 4 fishery began on June 14 and continued through to September 20 with a total of 19.5 fishing days for gillnets. This is below the averages of 22.9 days fishing for the period 1981 to 1993 and 24.2 between 1987 and 1993. The number of gillnet boat days was reduced from recent years with a total of only 7,985 in 1994 (the 1987 to 1993 average was 9,797). There were no seine openings in Area 4 in 1994 due to the below expected returns of both sockeye and pink salmon (the 1981 to 1993 average is 8.4).

Two new fisheries were instituted in 1994. During Weeks 25 and 26 two short duration gillnet openings were conducted to harvest Skeena chinook salmon in the terminal exclusion portion of Area 4 (River/Gap/Slough). The first opening was for twelve hours with 52 vessels participating while the second was for 16 hours with 56 boats fishing. In Weeks 38 and 39 short coho fisheries were scheduled in the outer portions of Area 4 from Smith Island out to the surf line.

The total gillnet catch of 555,229 sockeye and 160,250 pink salmon are both well below average and expected levels. From 1990 to 1993 the Area 4 gillnet catches have averaged 1,185,669 sockeye and 873,855 pink salmon.

In-season abundance is determined by the Skeena test fishery, harvest rate and CPUE models, native food fish catches and commercial catches in Area 4 and other fishing areas in northern BC and in southern Southeast Alaska.

The preliminary Skeena sockeye escapement estimate of 1.2 million is above the management target of 1.1 million and the test fishery estimate of 875,000. The Skeena pink escapement estimate from the test fishery is 300,000, well below the minimum escapement target of 1.0 million. Table 115 provides the preliminary 1994 spawning escapements for Area 4 and Table 125 the annual escapements from 1966 to 1993.

Area 5

Management of the Area 5 fishery during July is based on Skeena sockeye abundance with closures to protect depressed local sockeye stocks. In early August, the fishery targets on Skeena pink stocks which use Area 5 as a migration route. In late August fisheries are managed for local pink stocks.

Tables 126 and 127 illustrate the 1994 weekly catch in Area 5 outer (5-10, 5-11 and 5-12) subareas, while Tables 128 and 129 provide weekly total Area 5 catch. Catch information by gear type for 1960-1994 is provided in Tables 130-135 for total Area 5.

In 1994, the gillnet fishery in Area 5 began on June 27 in conjunction with the Area 4 gillnet sockeye fishery. Seine fishing in Area 5 began on July 17. August 1 was the last day of fishing for both gear types due to concerns for Skeena and local Area 5 pink stocks. Total days fishing (12.0 gillnet days, 5.0 seine days) were also below the 1980's average (16 gillnet days, 15 seine days), while the number of gillnet boat days (430) was lower than the 1980's average (451). The number of seine boat days (74) is well below the 1980's average (203) reflecting the poor pink returns in 1994.

The total sockeye harvest of 21,017 by gillnets and 9,711 by seines are both below the 1980-1989 averages of 26,090 and 24,695 respectively. The total pink catch of 25,018 is well below the 1980's average of 617,182. Of the total Area 5 pink catch 1,448 or 5.8 percent was harvested in Management Units 5-11 and 5-12.

Preliminary 1994 escapement information for Area 5 is provided in Table 115 and historical spawning escapements are provided in Table 136.

Area 1 Pink Troll Fishery

The 1994 Area 1 pink troll fishery opened July 1, and concluded September 14 when northern British Columbia was closed to all salmon trolling. The Area 1 pink troll catch in the A-B line areas strip (Figure 6) was monitored in-season by hailing trollers on the grounds to establish catch rates and by conducting overflights to estimate effort. The A-B line area catch estimate for the season was 73,820 pink salmon. Overall pink troll catches in Area 1 are monitored in-season from effort overflights and shore based sampling procedures. The Area 1 pink troll catch was 220,500. Table 137 illustrates the Area 1 weekly troll catches for 1993 and Table 138 outlines the annual (1973-1993) Area 1 troll catches.

Management Performance Relative to Treaty Requirements

Areas 3 (1-4) and 5-11 Pink Net Catch

Under the Pacific Salmon Treaty the outside portions of Statistical Areas 3 and 5 (Management Units 3-1, 3-2, 3-3, 3-4 and 5-11) are to be managed such that an average annual pink harvest of 900,000 is achieved.

In 1994, 249,651 pinks were harvested in Management Units 3(1-4) and 5-10/5-11 combined. Figures 6 and 7 illustrate the pink catch by net gear type for subareas 3(1-4) and total Area 3 from 1973-1994. Figure 8 tracks the proportion of the Area 3 net catch taken from subareas 3(1-4) from 1973 to 1994. Equivalent effort statistics are provided in Figures 9, 10 and 11. The proportion of the catch taken in subarea 3(1-4) during the 1994 season (70 percent) was substantially lower than the pre-Treaty average (1973-84, 73 percent) and slightly higher than the 1985-93 Treaty average of 62 percent. The 1994 gillnet effort in the outer subareas of Area 3 (62 percent), as a proportion of the total Area 3 gillnet effort, was substantially higher than both the pre-Treaty average (27 percent) and the 1985-1993 average of 47 percent. Seine effort in subareas 3(1-4), as a proportion of total Area 3, was 74 percent in 1994 which is slightly higher compared to both the pre-treaty average of 68 percent and the 1985-1993 average of 71percent.

Most years since the signing of the Treaty were characterized by exceptionally large pink returns to the Northern Boundary Area. Consequently, the current average annual pink harvest from 1985-1994 in the treaty area (subarea 3(1-4) and 5-10, 5-11, 5-12, 5-13) is 1,824,943. The following table illustrates the catch in these sub-areas:

Year	Annual Harvest 3(1-4)+5(-10,-11,-12)	Average Annual Harvest Since 1985
1985	1,276,647	1,276,647
1986	1,982,814	1,629,731
1987	1,851,424	1,703,628
1988	424,897	1,383,946
1989	2,259,445	1,559,045
1990	830,704	1,437,655
1991	6,960,798	2,226,676
1992	1,098,922	2,085,706
1993	1,314,130	1,999,976
1994	249,651	1,824,943

Area 1 Pink Troll Fishery

There was no specific arrangement for the Area 1 troll fishery in 1994. Preliminary information from saleslips indicate an Area 1 troll catch of 220,500. The pattern of total Area 1 weekly pink catch in 1994 is illustrated in Figure 12.

1995 Salmon Forecast Northern British Columbia

Introduction

Expectations and fishing plans for 1995 are still preliminary. Specific opening dates and fishing patterns are determined through consultations with industry and since this process has not yet been completed it is too early to provide details. A summary of the forecasts for Areas 1, 3, 4 and 5 are provided in Table 139.

Area 1 Expectations

Sockeye. There are no significant local sockeye stocks in Area 1. A catch of 50,000 Skeena and Nass sockeye is anticipated.

Pink. Local pink salmon area not expected to produce a harvestable surplus in 1995. Passing stocks, particularly Skeena pinks will make up the majority of the catch.

Chum. A very small gillnet assessment fishery is expected in Masset Inlet.

Fishing Plans. A fishery on Skeena-Nass bound sockeye and the pink is planned, and management will be based on abundance of these stocks.

Area 3 Expectations

Sockeye. An average sockeye return to Area 3 of 550,000 is expected to provide an Area 3 net catch of 300,000. In addition a catch of 300,000 Skeena sockeye is anticipated for a total catch of 600,000.

Pink. A modest pink return of 900,000 is expected to provide an Area 3 catch of 525,000. In addition, 100,000 Skeena pink are expected to be caught in Area 3 net fisheries, for a total catch of 625,000.

Chum. Area 3 chum stocks appear to be improving but still remain at or below target levels. Little or no targeted fishing is anticipated.

Fishing Plans. An above average sockeye fishery and a modest pink fishery are anticipated in Area 3 in 1995.

Area 4 Expectations

Sockeye. The Skeena sockeye return is forecast to be 2,500,000 to Canadian waters providing an Area 4 commercial net catch of 1,000,000.

Pink. The Skeena pink return is forecast to be 1,400,000 which is well below average due to low brood year escapements. This is expected to provide an Area 4 catch of 200,000.

Chum. Skeena chum escapements are severely depressed and chum are only caught incidentally.

Fishing Plans. In 1995, a fishing plan similar to 1994 is anticipated. Domestic management initiatives to maintain or increase the sockeye harvest while reducing the catch of coho and steelhead will again be the key factors in developing 1995 management plans.

Area 5 Expectations

Sockeye. A catch of approximately 2,000 local sockeye is predicted for Area 5. In addition, a directed fishery on Skeena stocks for a catch of 50,000 sockeye is also anticipated.

Pink. Local Area 5 pink and Skeena pink stock forecasts are poor which should result in a below average catch of about 60,000.

Chum. Local chum stocks are depressed, and no surplus is anticipated.

Fishing Plans. Area 5 fishing patterns will be based largely on the abundance of Skeena sockeye and pink.
