## LIST OF TABLES

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, troll, and subsistence fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2017....... 20
Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2017.
............................................................................................................................................ 22
Table 3. Terminal run reconstruction for Stikine River sockeye salmon, 2017. .............. 23
Table 4. Taku River sockeye salmon run reconstruction, 2017. Estimates do not include spawning escapements below the U.S./Canada border...................................................... 39
Table 5. U.S. inseason weekly estimates of traditional D111 drift gillnet Taku River wild sockeye salmon inriver run size, projected terminal run size, and resulting TAC for 2017.
$\qquad$
Table 6. Weekly large Chinook salmon guideline harvest for the Canadian assessment fishery in the Taku River for 2017..................................................................................... 47
Table 7. Forecasts of terminal run size, allowable catch (AC), weekly guidelines, and actual catch of Taku River large Chinook salmon, 2017. .48
Table 8. Canadian inseason forecasts of terminal run size, total allowable catch (TAC), and spawning escapement of wild Taku River sockeye salmon, 2017. .50
Table 9. Klukshu River harvest and escapement for the Chinook and sockeye salmon and Alsek River harvest for Chinook and sockeye salmon for 2017

## LIST OF FIGURES

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas. ................. 18

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas. ................... 58

## LIST OF APPENDICES

## Appendix A. 1. Weekly harvest estimates of Chinook salmon in the US gillnet, troll, recreational, and subsistence fisheries in District 108, 2017. .68

Appendix A. 2. Weekly harvest of Chinook salmon in the Canadian commercial, Telegraph Aboriginal, and recreational fishery in the Stikine River, 2017. ..... 68
Appendix A. 3. Weekly harvest of Chinook salmon in the Canadian test fisheries in the Stikine River, 2017. ..... 69
Appendix A. 4. Weekly harvest of sockeye salmon in the Alaskan District 106 and 108 fisheries, 2017 ..... 69
Appendix A. 5. Weekly stock proportions of sockeye salmon harvested in the Alaskan D106 commercial drift gillnet fishery, 2017. ..... 70
Appendix A. 6. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2017. ..... 71
Appendix A. 7. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2017. ..... 72
Appendix A. 8. Weekly stock proportions sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2017. ..... 73
Appendix A. 9. Weekly sockeye salmon harvest and effort in the Canadian commercial and assessment fisheries in the lower Stikine River, 2017. ..... 74
Appendix A. 10. Weekly sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery in the lower Stikine River, 2017. ..... 75
Appendix A. 11. Harvest by stock and week for sockeye salmon in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2017. ..... 76
Appendix A. 12. Weekly harvest, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye salmon stocks in the Stikine River test fishery, 2017 ..... 77
Appendix A. 13. Daily test harvest taken from the Tuya Assessment Fishery located above the Tahltan River, July 2017 ..... 77
Appendix A. 14. Weekly coho salmon harvest in the Alaskan District 106 and 108 fisheries, 2017 ..... 78
Appendix A. 15. Weekly harvest of coho salmon in the Canadian lower river commercial fishery and test fisheries 2017. ..... 79
Appendix A. 16. Weekly salmon effort in the Alaskan District 106 and 108 fisheries, 2017. ..... 79
Appendix A. 17. Weekly salmon effort in the Canadian fisheries in the Stikine River, 2017. .....  80
Appendix A. 18. Tuya assessment fishery, 2017 ..... 80
Appendix A. 19. Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 2017. ..... 81
Appendix A. 20. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 2017. ..... 82
Appendix A. 21. Daily counts of adult Chinook salmon passing through Little Tahltan weir, 2017. ..... 83
Appendix B. 1. Historic salmon harvest and effort in the Alaskan District 106 commercial gillnet fishery, 1960-2017. ..... 84
Appendix B. 2 Historic salmon harvest and effort in the Alaskan District 108 commercial gillnet fishery, 1962-2017. ..... 85
Appendix B. 3. District 108 total Chinook salmon estimates in the US gillnet, troll, recreational, and subsistence fisheries, 2005-2017. ..... 86
Appendix B. 4. Annual estimates of Stikine River large Chinook salmon in the U.S. gillnet,troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmonin District 108, 2005-2017.86
Appendix B. 5. Chinook salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2017. ..... 87
Appendix B. 6. Chinook salmon harvest in the Canadian commercial and recreational fisheries in the Stikine River, 1979-2017. ..... 87
Appendix B. 7. Chinook salmon harvest in inriver test fisheries in the Stikine River, 1985- 2017. ..... 88
Appendix B. 8. Index counts of Stikine River large Chinook salmon escapements, 1979- 2017. ..... 89
Appendix B. 9. General stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; District 106 \& 108, 1982-2017 ..... 90
Appendix B. 10. Stikine River stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1982-2017. ..... 91
Appendix B. 11. Tahltan sockeye salmon stock proportions and harvest of in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1994-2017. ..... 92
Appendix B. 12. Stikine River sockeye salmon harvest in the U.S. Subsistence fishery, 2004-2017 ..... 93
Appendix B. 13. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2017 ..... 94
Appendix B. 14. All harvest in of sockeye salmon in Canadian commercial and assessment fisheries, 1972-2017 ..... 95
Appendix B. 15. Sockeye salmon stock proportions and harvest by stock in the Canadian commercial and assessment fishery in the Stikine River, 1979-2017. ..... 96
Appendix B. 16. Tahltan sockeye salmon stock proportions and harvest by stock in the Canadian commercial and assessment fishery in the Stikine River, 1979-2017. ..... 97
Appendix B. 17. Tahltan Lake weir data with enhanced and wild Tahltan fish, 1979-2017. ..... 98
Appendix B. 18. Sockeye salmon harvest by stock in the Stikine River under Canadian ESSR licenses, 1992-2017. ..... 98
Appendix B. 19. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2017 ..... 99
Appendix B. 20. Aerial survey counts of Mainstem sockeye salmon stocks in the StikineRiver drainage, 1984-2017............................................................................................. 100
Appendix B. 21. Stikine River sockeye salmon run size, 1979-2017. ..... 101
Appendix B. 22. Tahltan wild and enhanced sockeye salmon run size, 1994-2017. ..... 102
Appendix B. 23. Coho salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2017 ..... 103
Appendix B. 24. Annual harvest of coho salmon in the Canadian lower and upper river commercial, Telegraph Aboriginal and the Canadian test fisheries, 1979-2017. ..... 104
Appendix B. 25. Index counts of Stikine River coho salmon escapements, 1984-2017. ..... 105
Appendix B. 26. Effort in the Canadian fisheries, including assessment fisheries in the Stikine River, 1979-2017. ..... 106
Appendix B. 27. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-2017 ..... 107
Appendix B. 28. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 1984-2017. ..... 108
Appendix B. 29. Weir counts of Chinook salmon at Little Tahltan River, 1985-2017. 109
Appendix C. 1. Weekly Chinook salmon estimates in the U.S. fisheries in D111, 2017.110
Appendix C. 2. Weekly Chinook salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River 2017 ..... 110
Appendix C. 3. Weekly sockeye salmon harvest of Alaskan D111 traditional and terminal hatchery access common property commercial drift gillnet fishery, 2017. ..... 110
Appendix C. 4. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery, 2017. ..... 111
Appendix C. 5. Weekly sockeye salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2017. ..... 111
Appendix C. 6. Estimates of wild and enhanced sockeye salmon stock harvested in the Canadian commercial fishery in the Taku River by week, 2017 ..... 112
Appendix C. 7. Weekly coho salmon harvest in the traditional Alaskan District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2017. ..... 112
Appendix C. 8. Weekly coho salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2017. ..... 113
Appendix C. 9. Weekly effort in the Alaskan traditional District 111 and StatArea 111-32(Taku Inlet), commercial drift gillnet fishery, 2017.114
Appendix C. 10. Weekly effort in the Canadian commercial and assessment fisheries in the Taku River, 2017 ..... 114
Appendix C. 11. Daily counts of adult sockeye salmon passing through Tatsamenie Lake weir, 2017 ..... 115
Appendix C. 12. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2017. ..... 116
Appendix C. 13. Daily counts of adult sockeye salmon passing through the King SalmonLake weir, 2017.117
Appendix C. 14. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2017. ..... 118
Appendix C. 15. Daily counts of large Chinook salmon carcasses at the Nakina River weir, 2017. ..... 119
Appendix D. 1. All historic harvest and effort of salmon in the D111 gillnet fishery, 1960- 2017. ..... 120
Appendix D. 2. District 111 total Chinook salmon harvest in the US gillnet, sport, and personal use fisheries, 2005-2017. ..... 121
Appendix D. 3. Annual estimates of Taku River large Chinook salmon in the D111 fisheries, 2005-2017. ..... 121
Appendix D. 4. Annual Chinook Salmon harvest in the Canadian fisheries in the Taku River, 1979-2017. ..... 122
Appendix D. 5. Taku River large Chinook salmon run size, 1979-2017. ..... 123
Appendix D. 6. Aerial survey index escapement counts of large (3-ocean and older) Taku River Chinook salmon, 1975-2017. ..... 124
Appendix D. 7. Annual sockeye salmon harvest in the Alaskan District 111 fisheries, includes estimates of Taku wild and enhanced fish in the gillnet, seine, and personal use fisheries, 1967-2017. ..... 125
Appendix D. 8. Stock proportions and harvest of sockeye salmon in the traditional Alaska District 111 commercial drift gillnet fishery, 1983-2017. ..... 126
Appendix D. 9. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet harvest by week, 1983-2017. ..... 127
Appendix D. 10. Annual sockeye salmon harvest estimates of wild and enhanced fish in the Canadian fisheries in the Taku River, 1979-2017. ..... 128
Appendix D. 11. Annual sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery on the Taku River, 1986-2017. ..... 129

## EXECUTIVE SUMMARY

Final estimates of harvests and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek rivers in 2017 are presented and compared with historical patterns. Average, unless defined otherwise, refers to the most recent 10-year average (2007-2016). Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. The TBR sockeye salmon Oncorhynchus nerka enhancement projects are also reviewed.

## Stikine River

The postseason estimate of the 2017 Stikine River sockeye salmon terminal run was 98,800 fish, of which approximately 67,300 fish were harvested in various fisheries including assessment/test fisheries. An estimated 31,500 Stikine River fish escaped to spawn; 2,900 fish were removed for brood stock, and an estimated 580 fish migrated to the barrier in the Tuya River and were not harvested. The terminal run was below average and the harvest was below average (even when Tuya was excluded). The Tahltan Lake sockeye salmon total weir count was 19,200 fish was within the goal range of 18,000 to 30,000 fish. The estimated spawning escapement of 11,700 mainstem Stikine River sockeye salmon was below the goal range of 20,000 to 40,000 fish. The estimated U.S. commercial harvest of Stikine River sockeye salmon in Districts 106 and 108, including the Stikine River subsistence fishery, was 23,600 fish. The sockeye salmon harvest in the Canadian inriver commercial was 32,900 fish and the AF harvest was 8,600 fish. The inriver test fisheries harvested 1,900 sockeye salmon. Weekly inseason run projections from the SMM ranged from 141,900 to 154,300 sockeye salmon; the inseason model prediction was 154,300 fish, with a TAC of 94,200 fish. The postseason terminal run estimate was 98,800 fish and an AC estimate of 23,000 Stikine River sockeye salmon for each country, Canada harvested $191 \%$ and the U.S. harvested $108 \%$ of their respective TACs.

There were no directed fisheries for Stikine River Chinook salmon in either the U.S. or Canada in 2017. The 2017 Stikine River large Chinook salmon terminal run was estimated at 8,150 fish, of which approximately 800 fish were harvested in various fisheries. The estimated escapement of Stikine River large Chinook salmon was 7,210 fish; below both the escapement goal target of 17,400 fish and the escapement goal range 14,000 to 28,000 fish. The run and harvest were well below their respective averages. The Little Tahltan River large Chinook salmon escapement of 430 fish was well below the Canadian escapement target of 3,300 fish and below the lower bound of the Canadian target range of 2,700 to 5,300 fish. The estimated incidental U.S. commercial harvest of Stikine River Chinook salmon in Districts 108 gillnet, test, troll, subsistence, and sport fisheries was 210 fish. The estimated Canadian incidental commercial, Aboriginal, assessment/test, and sport fisheries harvest was 600 fish. Managers used only model outputs in 2017 to generate inseason run sizes after SW 20. The extremely low catches at the Kakwan Point tagging site and the lack of early assessment and commercial fisheries did not allow the use of MR data inseason. The model projections of inseason run size were consistent throughout the course of the fishery in predicting a terminal run size that was substantially lower than the
preseason expectation of 18,300 large Chinook salmon. Weekly inseason run size projections ranged from less than 14,000 to less than 10,000 large Chinook salmon.

The 2017 run size of Stikine River coho salmon cannot be quantified. The U.S. harvest of Stikine River coho salmon is also unknown since there is no stock identification program for this species. Mixed stock coho salmon harvest in District 106 49, 400 fish (19\% Alaska hatchery) and District 108 was 13,700 fish (10\% Alaska hatchery). The Canadian inriver coho salmon harvest of 5,500 fish was above average. The annual aerial surveys indicated an average return to the 6 index sites that were surveyed by Canada. The inseason weekly CPUE of coho salmon from the lower Stikine River Canadian fishery was above average.

Taku River
The estimate of the 2017 Taku River sockeye salmon terminal run is 213,400 fish; 199,300 wild fish, and 14,200 hatchery fish. The U.S. harvested 68,500 wild fish, Canada harvested 27,600 wild fish, and the estimated above border spawning escapement was 103,200 wild sockeye salmon. The terminal run size was above average while the wild fish escapement was average and above the goal range of 71,000 to 80,000 fish. The U.S. and Canada harvested an estimated $70 \%$ and $105 \%$ of their respective ACs calculated using a $79 \%$ / $21 \%$ (U.S./Canada) harvest sharing split based on enhanced fish production.

The estimated 2017 Taku River large Chinook salmon terminal run was 8,650 fish; above border run was 8,470 fish and spawning escapement was 8,220 fish. The run was the lowest on record and the harvests were well below average. The total harvest of large Chinook salmon in the Canadian commercial fishery in the Taku River was 250 fish. The traditional District 111 mixed stock drift gillnet fishery total harvest was 1,080 Chinook salmon of all sizes and an estimated 140 Taku River large Chinook salmon.

The estimated above border run of Taku River coho salmon in 2017 is 65,700 fish, which was $66 \%$ of average. The Canadian inriver commercial harvest was 7,800 coho salmon. After all Canadian harvests are subtracted from the above border run the above border spawning escapement is estimated at 57,900 coho salmon, slightly above the bottom end of the newly adopted escapement goal range of 50,000 to 90,000 fish. The U.S. harvest of 13,500 coho salmon in the traditional District 111 mixed stock fishery was well below average. Alaskan hatcheries contributed an estimated 800 fish, or 5\% of the District 111 harvest.

#### Abstract

Alsek River The 2017 Alsek River harvest of 5,000 sockeye salmon in the U.S. commercial fishery was below average. The Canadian inriver recreational fishery reported a harvest of 40 sockeye salmon while the Aboriginal food fishery harvest was approximately 580 fish. The Klukshu River weir count of 3,900 sockeye salmon was below average and the escapement of 3,700 fish was below the escapement goal range of 7,500 to 11,000 fish. The count of 1,100 early run sockeye salmon (i.e. through August 15) and the late run count of 2,800 fish were both below average.

The 450 Chinook salmon counted through the Klukshu River weir was below average and the estimated escapement ( 440 fish) was below the escapement goal range of 800 to 1,200 Chinook salmon. The U.S. Dry Bay harvest of 130 large Chinook salmon was below average. The Canadian recreational and Aboriginal fishery harvests of 60 and 10 fish, respectively, were both below average.

Current stock assessment programs prevent an accurate comparison of the Alsek River coho salmon run with historical runs. There was minimal effort during the U.S. Dry Bay coho salmon fishery and harvest figures are negligible. The Canadian recreational and Aboriginal fisheries harvested no coho salmon. The operation of the Klukshu River weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is complete.

## Enhancement

In 2017, eggs and milt were collected from sockeye salmon at Tahltan, Tatsamenie, and Trapper lakes. An estimated 3.85 million eggs were collected at Tahltan Lake, 2.0 million eggs at Tatsamenie Lake, and 280 thousand eggs at Trapper Lake. Prior to the start of egg collection at Tahltan Lake, Canada revised the egg-take goal to 3.5 million sockeye salmon eggs based on actual escapement into Tahltan Lake and matching estimated enhanced smolt production to expected wild smolt production. Canadian technical staff has determined that the fry from a 3.5 million level egg take can all be planted into Tahltan Lake without exceeding agreed to stocking guidelines.

In 2017, outplants of brood year 2016 sockeye salmon fry were as follows: 3.1 million fry into Tahltan Lake; 1.02 million fry were released directly and 138 thousand net pen reared fry were released into Tatsamenie Lake; and 212,000 fry were released into Trapper Lake. Green-egg to planted-fry survivals were $59 \%, 68 \%$ and $68 \%$ for Tahltan, Tatsamenie and Trapper lakes; respectively.

Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate weekly contribution of fish from U.S./Canada TBR fry planting programs to District 106, 108, and 111 drift gillnet fisheries and to Canadian lower commercial and test fisheries in the Stikine and Taku rivers. Postseason estimates of stocked fish to Alaskan harvests were 7,152 Stikine River fish to District 106 and 108, and 6,100 Taku River fish to District 111. Postseason estimates of stocked fish to Canadian fisheries included 16,600 fish to Stikine River fisheries and 2,800 fish to the Taku River fisheries.

## INTRODUCTION

This report presents estimates of the 2017 harvest and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek rivers and describes management actions taken during the season. Harvest and effort data are presented by week, for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku rivers are also summarized.

The TTC met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: PSC TTC, TCTR (13)-3 Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers, 2017.

Run reconstruction analyses are conducted on the sockeye salmon Oncorhynchus nerka and Chinook salmon O. tshawytscha runs to the Stikine and Taku rivers and to the Taku River for coho salmon $O$. kisutch for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine harvest are made for Alaskan fisheries outside of District 106 and 108 for Stikine River stocks, District 111 for Taku River stocks and Subdistrict 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial drift gillnet and troll fisheries as well as recreational and subsistence fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet and assessment/test fisheries located in the lower and upper Stikine River, and by a Canadian AF in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are occasionally operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A recreational fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a U.S. personal use fishery was established in the lower Stikine River; no harvests were reported in this fishery in 1995 through 2000. Approximately 30 sockeye salmon were harvested in 2001, and the personal use fishery on the Stikine River was not open in 2002 and 2003. A U.S. subsistence fishery was opened in 2004 for sockeye salmon and in 2005 for Chinook and coho salmon.

In 1993, the U.S. spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108. The three areas in District 108 and one area in District 6 have remained unchanged and have opened in the absence of District 108 directed Stikine River Chinook salmon fisheries.

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m}^{3}$ of debris into the river which may have restricted access to Tahltan River Chinook and sockeye salmon spawning sites until mid-July 2014. For the 2014 season, Canada estimated that approximately $70 \%$ and $7 \%$ of the Chinook and
sockeye salmon respectively failed to access their traditional spawning grounds located above the landslide. In March 2015 select boulders at the landslide were demolished using an industrial expansion compound set into drill holes within the boulders. The resulting fragments were displaced downstream by manual labor and by the erosional effects of the spring freshet. The exercise resulted in an increase in the channel width, ridding the site of a "pinch point" where it was observed that salmon struggled in their attempts to ascend the river in 2014. In 2015, Chinook salmon were observed attempting to negotiate the landslide from late May to late June with successful passage confirmed June 28 and after (on average approximately $50 \%$ of the fish enter the Tahltan River by late June). In 2015 during very low flow regimes, some sockeye salmon were observed being rejected from the landslide channel; moreover, several sockeye salmon carcasses were observed below the landslide. In 2016 and 2017, water levels were generally conducive to fish passage and Chinook and sockeye salmon were observed successfully passing the landslide.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Fishing arrangements in place for salmon originating from the Canadian portion of the Stikine River watershed are provided in Annex IV, Chapter 1 of the PST and can be found at: http://www.psc.org/pubs/treaty.pdf. These arrangements include: directed fisheries for Chinook salmon; continuation of a U.S. subsistence fishery on Chinook, sockeye, and coho salmon stocks within the U.S. section of the Stikine River; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the presumed production of enhanced fish.

As in most previous years, the TTC met prior to the season to update joint management and enhancement plans, develop run forecasts, and determine new parameters for input into the inseason Chinook and sockeye salmon run projection models. The Chinook salmon model is referred to as the SCMM and served as a key management tool governing weekly fishing regimes for Stikine River Chinook salmon. The SCMM, however, was complemented inseason with a concurrent MR study and other inriver assessment methods. The sockeye salmon model is referred to as the SMM. The SMM was complemented inseason with concurrent inriver run size estimates based on fishery performance against historical fishery performance and run size estimates.

## Chinook Salmon

The SCMM model is based on the linear regression (correlation) between weekly cumulative CPUE of large Chinook salmon at the tagging site, located near the mouth of the Stikine River, and terminal run size based on MR studies conducted in 1996-2016. Most of the CPUE and run size data sets (CPUE vs. run size) are significantly correlated, although there are statistical challenges with the SCMM at low CPUE levels such as those seen in 2017 as they lie outside of the established relationship. Generalized inseason model estimates were generated commencing in SW 21 but were primarily for information purposes as there were no directed inriver commercial fisheries (Table 1). Traditional mark-recapture estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were unavailable due to low catch rates during the first event and the lack of directed commercial fisheries (second event).The SCMM was the only available indication of run strength during the Chinook salmon reporting period. In order to abide by Annex IV, Chapter1, Paragraph 3(a)(3)(vii), which obliges the Parties to apportion their overall TAC by historical weekly run timing, weekly fishery openings were announced based on weekly guideline harvests.

The preseason run size estimate of 18,300 large Chinook salmon was below the threshold run size limit of 28,100 fish (Table 1); hence, there were no directed Chinook salmon fisheries in the U.S. and Canada. The threshold number is the sum of the midpoint escapement goal (21,000 fish) + the Canadian BLC ( 2,300 fish $)+$ the U.S. BLC $(3,400$ fish) + the inriver assessment/test fishery harvest ( 1,400 fish). In conjunction with the AC associated with the directed fishery, both U.S. and Canada are permitted a base level catch harvested as bycatch taken in the course of the targeted sockeye salmon net fisheries and Chinook salmon taken in traditional recreational fisheries. In response to conservation
concerns for Chinook salmon in 2017, the Canadian directed sockeye salmon fishery opening was delayed by one week (to SW 26) to avoid Chinook salmon bycatch, and once the sockeye fishery opened, fishermen were encouraged to release all Chinook salmon bycatch with a chance of survival.

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, troll, and subsistence fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2017.

|  |  | Terminal Run |  |
| :---: | :---: | :---: | :---: |
| SW | Start Date | Estimate | Method |
| 19 | 7-May | 18,300 | Preseason |
| 20 | 14-May | 18,300 | Preseason |
| 21 | 21-May | 18,300 | SCMM |
| 22 | 28-May | $<14,000$ | SCMM |
| 23 | 4-Jun | $<14,000$ | SCMM |
| 24 | 11-Jun | $<10,000$ | SCMM |
| 25 | 18-Jun | $<10,000$ | SCMM |
| 26 | 25-Jun | $<10,000$ | SCMM |
| 27 | 2-Jul | $<10,000$ | SCMM |
| 28 | 9-Jul | $<10,000$ | SCMM |
| 29 | 16-Jul | $<10,000$ | SCMM |

The preseason forecast for the Stikine River large Chinook salmon terminal run was approximately 18,300 large Chinook salmon (Table 1), which indicated a run size characterized as below average. Joint Canadian and U.S. inseason predictions of terminal run size ranged from less than 14,000 to less than 10,000 large Chinook salmon (Table 1). Project biologists used the daily harvest and effort data transmitted from the Kakwan Point tagging site and from the commercial fishing grounds to make weekly run projections based on the SCMM model. Joint weekly run size estimates were calculated on Wednesday or Thursday of the current week. Given the very low run strength and paucity of spaghetti tags recovered inseason, managers used the preseason forecast during SW 19-21 and used only the SCMM to generate a directional estimate (i.e. $<10,000$ ) weekly through the remainder of the Chinook salmon reporting period. Point estimates were not statistically defensible due to the inseason model data lying outside of the established relationship to CPUE and run size as determined by the MR. The first inseason estimate was generated in SW 21. Based on postseason MR data from Chinook salmon bycatch in the directed inriver commercial fisheries, tag recoveries from Verrett and Little Tahltan river escapement sampling, and the U.S. harvest from District 108, the postseason estimate of the terminal run size of Stikine Chinook salmon was 8,131 large Chinook salmon, which is similar to the final inseason SCMM model estimate of less than 10,000 large Chinook salmon in SW 29 (Table 1). The 2017 Little Tahltan River escapement of 428 large Chinook salmon represents $6 \%$ of the total Stikine River escapement of 7,206 large fish, close to the average of approximately $7 \%$ (note that this average has declined significantly in the last ten years).

## Sockeye Salmon

The preseason forecast for the Stikine River sockeye salmon run was approximately 185,000 fish (Table 2), and characterized as an above average run. The forecast included approximately 58,000 natural Tahltan sockeye salmon, 52,000 enhanced Tahltan fish, 24,000 enhanced Tuya sockeye salmon, and 51,000 mainstem sockeye salmon. The preseason forecast was used for management purposes for SW 26 and 27 and the SMM was used beginning in SW 28. The Canadian lower river commercial fishery opening was delayed for one week from SW 25 to SW 26 to address Chinook salmon conservation concerns.

Starting in SW 28, weekly inputs of the harvest, effort, and stock composition were entered into the SMM to provide weekly forecasts of run size and TAC. Specific inputs include proportion Tahltan/Tuya from egg diameters, proportion enhanced Tuya from thermal mark analyses of otoliths in the Canadian lower river test (when in operation) and commercial fisheries; the upper river harvest in the AF and upper river commercial fishery; the catch, effort and assumed stock composition in Subdistrict 106-41 (Sumner Strait), Subdistrict 106-30 (Clarence Strait), and District 108.

The SMM provides inseason projections of the Stikine River sockeye salmon run, including: the Tahltan stock (wild and enhanced combined); the stocked Tuya stock; and the mainstem stocks. The SMM predicts run size for each week of the fisheries using linear regression of historical stock specific harvest data and cumulative CPUE. It breaks the stock proportions in District 106 and 108 harvests, using historical postseason scale pattern analysis (SPA), into triggers of run size for Tahltan and Mainstem; the averages used each week depended upon whether the run was judged to be below average ( $0-40,000$ fish), average ( $40,000-80,000$ fish), or above average ( $+80,000$ fish). The SMM for 2017 was based on CPUE data from 1994 to 2016 from the Alaska District 106 fishery and the Canadian commercial fishery in the lower river and from the lower Stikine River test fishery from 1986 to 2004. The enhanced Tuya and Tahltan stock proportions are adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108 harvests.

Generally, the SMM has used the Canadian Lower River Commercial (LRCF) fishery CPUE to estimate the inriver run size; however, the Lower River Test fishery CPUE data was available to enter into the SMM model to compare and contrast the respective run sizes generated from each of the inputs. In 2017 the upper commercial fishing zone (Flood fishery) was not opened for harvest; in years that it is opened, the harvest and effort from this area are excluded from the CPUE and not used in the model estimate. The annual weekly CPUE values were adjusted in order to make the current year data comparable with historical CPUE. For example, during 1979-1994 and 2000-2004, 2010-2016, only one net per license was permitted, while in 1996-1999 and 2005-2009 two nets per license were allowed. Only one net was permitted in the 2017 fishing season.

The Stikine Forecasting Management Model (SFMM) was also used in season, as decided by the TTC. The SFMM and test results were summarized in: PSC Technical report No.

38 Stikine Sockeye Salmon Management Model: Improving Management Uncertainty. This model was based on a second order polynomial relationship between weekly cumulative harvest or CPUE in District 106-41 and yearly run size. Triggers of run size for the Tahltan stock were $\leq 98,000$ fish or $>98,000$ fish in the District 106-41 fishery, and 0, $<46,000$ fish, or $>175,000$ fish in the District 108 fishery. Triggers were not used for the mainstem stock. Additional model runs using cumulative harvest or CPUE in the District 108 sockeye salmon area was also tested. The sockeye salmon area harvest and CPUE in District 108 does not include 108-20 and 108-10 fishing areas, or midweek openings.

Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2017.

${ }^{\mathrm{a}}$ Total count of fish pass the traditional fisheries.
${ }^{\mathrm{b}}$ Harvest allowed in terminal areas under the Excess Salmon to Spawning Requirement license.
${ }^{\text {c }}$ Fish returning to the Tuya system are not able to access the lake where they originated due to velocity barriers.
${ }^{d}$ The number of Tuya fish that should be passed through traditional fisheries in order to harvest the Tuya stock at the same rate as the Tahltan stock to ensure adequate spawning escapement for Tahltan fish.
${ }^{\mathrm{e}}$ Includes traditional, ESSR, and test fishery Harvestes.
${ }^{\mathrm{f}}$ Does not include ESSR or test fishery Harvestes.
${ }^{\mathrm{g}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for Harvestes other than in the listed fisheries.

## U.S. Fisheries

The 2017 District 106 drift gillnet fishery was open for 41 days from June 18 through October 3. Total fishing time was below average ( 48 days). Sections 6-A, 6-B, and 6-C were open simultaneously each week throughout the season. Weekly participation was near average for the first three quarters of the openings and below average for the last quarter and ranged between 75 permits in SW 33 to 14 permits in SW 40. Total season effort in boat days was 2,263 and was below the average of 2,753 boat days.

District 106 drift gillnet fishery salmon total harvest was below average and included: 1,521 Chinook, 45,005 sockeye, 49,382 coho, 302,033 pink, and 234,349 chum salmon. Chum salmon harvest was well above average and the pink salmon harvest was above average, while the Chinook, sockeye, and coho salmon harvests were below average. An estimated 986 Chinook salmon in the District 106 harvest (65\%) were of Alaska hatchery origin. An estimated 9,789 Stikine River sockeye salmon were harvested in District 106, approximately $22 \%$ of the harvest. An estimated 9,553 coho salmon in the District 106 harvest (19\%) were of Alaska hatchery origin.

Stikine River sockeye salmon harvests in the two major fishing areas of District 106 were markedly different. In the Sumner Strait fishery (Subdistrict 106-41) 28,444 sockeye salmon were harvested, of which 9,072 fish were estimated to be Stikine River sockeye salmon which contributed $32 \%$ of the total sockeye salmon harvest in that subdistrict. In the Clarence Strait fishery (Subdistrict 106-30) 16,561 sockeye salmon were harvested, of which an estimated 717 fish were estimated to be Stikine River sockeye salmon and contributed $4 \%$ of the total sockeye salmon harvest in that subdistrict.

The District 108 drift gillnet fishery was opened for a total of 43 days starting June 25. Total fishing time was below average ( 51 days) excluding periods in years when directed Chinook salmon fishing occurred. District 108 closed concurrently with District 106 on October 3. Participation in District 108 was below average most weeks, with the exception of SWs 29 and 30. The total season effort of 1,380 boat days was well below the average of 2,028 boat days.

District 108 drift gillnet salmon total harvest was below average and included: 3,817 Chinook, 14,282 sockeye, 13,592 coho, 49,027 pink and 177,119 chum salmon. Similar to District 106, the harvests of pink and chum salmon were above average, while Chinook, sockeye, and coho salmon harvests were below average. Large Chinook salmon harvested in District 108 drift gillnet fishery from SWs 26 through 29 totaled 2,221 fish. Genetic stock analysis identified 19 large Chinook salmon harvested through SW 29 as above border Stikine River origin. In the District 108 drift gillnet fishery an estimated 12,093 Stikine River sockeye salmon were harvested which contributed to $85 \%$ of the District 108 sockeye salmon harvest. An estimated 10\% (1,323 fish) of the District 108 coho salmon harvest were of Alaska hatchery origin.

The Stikine River Chinook salmon preseason forecast of 18,300 fish was insufficient to allow directed fisheries in District 108. Due to poor performance of Chinook salmon
fisheries in Southeast Alaska, restrictions were implemented in the Districts 106 and 108 gillnet fisheries to conserve Chinook salmon. In District 106, a six-inch maximum mesh restriction was in place for the first two openings. In District 108, in addition to a one week delay of the initial opening; time, area, and mesh restrictions were also implemented through SW 28.

In 2017, U.S. subsistence fisheries targeting sockeye and coho salmon occurred on the Stikine River and were managed by the USFS; however, the directed subsistence Chinook salmon fishery was not opened. Subsistence fishing was restricted to federally qualified users and required a permit issued by the USFS to participate and was restricted from marine waters to the U.S./Canadian border. Fishing in "clearwater" tributaries, side channels, or at stock assessment sites was also prohibited. Annual guideline harvest levels were 600 sockeye and 400 coho salmon. Allowable gear for the fishery included: dipnets, spears, gaffs, rod and reel, beach seine, and gillnets not exceeding 15 fathoms in length with mesh size no larger than $51 / 2$ inches were allowed. A total of 14 Chinook salmon was harvested incidentally during the subsistence sockeye salmon fishery through SW 29. Subsistence fishing was allowed from June 21 through July 31 to target sockeye salmon and from August 1 through October 1 to target coho salmon. In 2017, a total of 130 permits were issued and the estimated harvests included 14 large Chinook, 1,727 sockeye, and 117 coho salmon.
U.S. harvest of large Stikine River Chinook salmon in all District 108 fisheries were minimal and well below the U.S. BLC. The estimated harvest of large Stikine River Chinook salmon by the District 108 drift gillnet fishery through SW 29 was 18 fish based on GSI. The District 108 Spring Troll hatchery access fishery began May 1 and was restricted to one hatchery access area near Anita Bay. Open time was limited to four openings of two days each and closed on May 24. Commercial trolling remained closed in District 108 until the opening of the Summer Troll fishery on July 1. Harvest of large Stikine River Chinook salmon in the District 108 troll fisheries was estimated to be 35 fish based on CWT data. The District 108 sport fishery was restricted to 1 Chinook salmon bag and possession limit beginning May 1 and beginning May 25 waters near the terminus of the Stikine River were closed to sport fishing. Harvest of Stikine River Chinook salmon in the sport fishery is estimated to be 139 fish based on GSI. Cumulative U.S. District 108 base level fishery harvest by all gear groups through SW 29 was estimated to be 193 fish, well below the U.S. BLC of 3,400 large Stikine River Chinook salmon.

Stikine River sockeye salmon preseason forecast indicated an above average terminal run size of 185,000 fish, with a resulting U.S. AC of 62,000 fish (Table 2). Preseason forecasts were the primary basis used for management during SW's 25 through 27. Inseason estimates of terminal run sizes were first produced on a weekly basis beginning in SW 27 and were used from SW 28 through the end of season with the final inseason estimate being produced in SW 33. Inseason abundance estimates were variable and ranged between 136,000 and 154,000 fish. The postseason Stikine River sockeye salmon run estimate of 98,768 fish resulted in an U.S. AC of 21,804 sockeye salmon. The total U.S. harvest was estimated to be 23,609 fish, based on GSI analysis (Table 3).

While District 108 remained closed for the initial directed sockeye salmon opening in SW 25, District 106 opened at 12:00 noon on Sunday, June 18, for an initial period of 2 days with a six inch maximum gillnet mesh restriction in place. On the grounds surveys indicated an abundance of sockeye salmon below the level to warrant additional fishing time. Effort was comprised of 11 boats in Clarence Strait (106-30), 42 boats in Sumner Strait (106-41). An estimated 960 Stikine River sockeye salmon were caught in the District 106 drift gillnet fishery this week.

Districts 106 and 108 drift gillnet fisheries opened for an initial 2 days in SW 26 (June 25July 1) with a six-inch mesh restriction in both districts. The opening was initially planned for 3 days based on the preseason forecast of Stikine River sockeye salmon and anticipated effort but was reduced to 2 days due to the low returns of Stikine River Chinook salmon. Additionally, an expanded area off the Stikine River delta in District 108 was closed. Harvest rates of sockeye salmon were below average in both districts. Given the allowable catch associated with the preseason forecast of Stikine River sockeye salmon, low effort, and associated harvest levels observed during the on the grounds surveys, a 24 -hour extension occurred. An estimated 3,895 Stikine River sockeye salmon were harvested this week with the majority ( 2,650 fish) being harvested in District 106. During SW 26, 30 boats fished in Sumner Strait, 38 boats fished in Clarence Strait, and 23 boats fished in District 108.

Both districts were opened for an initial 3 days in SW 27 (July 2-July 8) beginning at noon Sunday. Mesh and area restrictions continued to be in place in District 108. On the grounds surveys indicated that a majority of the fleet were targeting enhanced salmon returning to Anita Bay. Improvements to sockeye salmon harvest rates were observed for participants targeting sockeye in both districts. Considering effort levels, sockeye abundance and the preseason forecast, both districts were extended for one day and District 108 opened for an additional one day mid-week opening. There were 32 boats in Sumner Strait, 27 boats in Clarence Strait, and 47 boats in District 108. An estimated 6,232 Stikine River sockeye salmon were caught this week; 2,729 fish in District 106 and 3,504 fish in District 108.

During SW 28 (July 9-July 15), Districts 106 and 108 were opened for an initial 4 days with an additional 1-day midweek opening in District 108. The first inseason forecast of Stikine River sockeye salmon terminal run size generated for this week was 140,100 fish with a resultant U.S. AC of 39,400 fish, which was considerably below the preseason forecasts (Table 2). However, on the grounds surveys of the gillnet fleet in both districts indicated average sockeye salmon abundance for boats targeting sockeye. This combined with good inriver harvests indicated that the SMM was not responding well, which is typical for initial model outputs. The U.S. cumulative harvest of Stikine River sockeye salmon through SW 28 was estimated to be 15,478 fish. Effort was below average with 30 boats in Clarence Strait, 19 boats in Sumner Strait, and 53 boats in District 108.

Districts 106 and 108 were opened for an initial 3 days during SW 29 (July 16-July 22). Effort increased to near average in District 106 with 25 boats in Clarence Strait and 33 boats in Sumner Strait. Harvest rates of sockeye salmon in both subdistricts fell to below average. Effort in District 108 increased to above average with 65 boats making landings.

However, a majority of the fleet continued to target enhanced chum salmon in District 108. Surveys of fishermen targeting sockeye salmon in District 108 indicated that harvest rates of sockeye salmon continued to be near average. The SMM assessment provided a slight decrease with a projected run size of 136,300 sockeye salmon, which resulted in a U.S. AC of 37,600 fish (Table 2). District 8 opened for an additional 1-day mid-week opening to harvest available surplus Stikine River sockeye salmon. An estimated 2,572 Stikine River sockeye salmon were harvested in SW 29 with a cumulative harvest of 18,050 fish.

Both districts were open for an initial 2 days during SW 30 (July 23-July 29). Opening time for District 106 was limited to 2 days for this week and the following week to allow McDonald Lake sockeye salmon to pass through the area. Run size estimates and the corresponding U.S. AC produced by the SMM increased in SW 30, which resulted in a U.S. AC of 40,800 fish (Table 2). Due to the available U.S. AC, District 108 opened for a 1-day mid-week opening. An estimated 1,318 Stikine River sockeye salmon were harvested by U.S. fisheries this week with a cumulative harvest of 19,368 fish. Effort included 34 boats in Clarence Strait, 19 boats in Sumner Strait, and 65 boats in District 108.

Sockeye salmon harvest fell sharply during SW 31 (July 30-August 5) and continued to decline each week until the end of the season. This was the final week for Stikine River sockeye salmon management. Both districts were open for an initial 2 days. The inseason forecast for SW 31 estimated a terminal run size of 143,500 Stikine River sockeye salmon with an available U.S. AC of 41,500 fish. The cumulative U.S. harvest of Stikine River sockeye salmon this week was 20,067 fish. On the grounds surveys indicated that sockeye salmon harvest rates were below average in both districts with near average effort in District 106 and above average in District 108. Additionally, historical run timing for Stikine River sockeye consisted mostly of the mainstem component of the run during this time of year. Recent model runs indicated a below average return of the mainstem component coupled with very little surplus in the mainstem portion of the AC. With poor sockeye salmon harvest rates and mainstem AC concerns, no additional time occurred. Effort included 29 boats fishing in Clarence Strait, 23 boats in Sumner Strait, and 53 boats in District 108. An estimated 1,815 Stikine River sockeye salmon were harvested in the District 106 and 108 drift gillnet fisheries through the remainder of the season.

During SWs 32 through 35 (August 6-September 2), both Districts 106 and 108 were managed based on pink salmon abundance. That portion of Section 6-D in District 106 along the Etolin Island shoreline was closed to gillnet fishing from SW 32 through SW 35 by regulation. Three day openings occurred in SW 32 through 34 . SW 35 was open for 2 days. Effort in both districts was below average during most openings of this of this period.

Beginning in SW 36 (September 3-September 9), management emphasis transitioned from pink salmon to wild coho salmon abundance. Prior to the switch to coho salmon management, 27,816 coho salmon, approximately $56 \%$ of the total District 106 harvest, had been harvested. The hatchery contribution was approximately 5,491 fish in District 106 prior to SW 36 and was comprised primarily of Neck Lake/Burnett Inlet enhanced summer coho salmon. During the coho salmon management period, coho salmon harvests
were below average in District 106 with an estimated harvest of 4,062 hatchery fish and 17,504 wild coho salmon. Harvest of wild coho salmon in District 108 was also below average with an estimated harvest of 12,181 fish. However, wild coho salmon harvest rates ended up above average during the coho management period for District 108. Both districts opened for 2 days each week during the coho management period (Table 15). The 2017 drift gillnet season concluded at noon on Tuesday, October 3, in both districts.

## Canadian Fisheries

Final harvests from the combined Canadian commercial, Aboriginal gillnet and recreational fisheries in the Stikine River in 2017 included; 722 large Chinook, 793 nonlarge Chinook, 41,749 sockeye, 5,502 coho, 337 chum, and 511 pink salmon. The test/terminal area fishery designed to target on Tuya bound fish at a site located in the mainstem Stikine River between the mouth of the Tahltan and the mouth of the Tuya River was not prosecuted in 2017.

The harvest of large and nonlarge Chinook salmon was well below average. The sockeye salmon harvest was below average. The estimate of the total contribution of sockeye salmon from the Canada/U.S. fry-stocking program to the combined Canadian Aboriginal and commercial fisheries was 16,365 fish, $38 \%$ of the harvest. The harvest of 5,502 coho salmon was above average.

The Chinook salmon assessment fishery was not conducted in 2017 in response to the poor preseason forecast and the decision to maximize the number of fish returning to the spawning grounds. A sockeye salmon test fishery was conducted for stock assessment purposes in the lower Stikine River from 21 June to 11 August, 2017. The test fishery was located immediately upstream from the Canada/U.S. border. Test fishery catches totaled 10 large Chinook, 23 nonlarge Chinook, 1,908 sockeye, 12 coho, 101 pink, 56 chum salmon, and 1 steelhead trout (all steelhead trout were released). The objectives of the sockeye salmon test fishery were similar to those in previous years: to provide inseason catch, stock ID and effort data for input, if necessary, into the SMM to estimate the inriver run size; and, to determine migratory timing and stock composition of the sockeye salmon run for use in the postseason estimations of the inriver sockeye salmon run.

The coho salmon test fishery was not conducted in the lower Stikine River in 2017.

## Lower Stikine River Commercial Fishery

The Canadian commercial fishery on the lower Stikine River harvested 312 large Chinook, 610 nonlarge Chinook, 32,849 sockeye, 5,502 coho, 511 pink, and 337 chum salmon. A total of 216 steelhead trout were released in 2017; 258 large Chinook, 9 nonlarge 868 pink and 265 chum salmon were also released. For 2017, there was no directed Chinook salmon fishery. All the large Chinook salmon were incidentally harvested in the directed sockeye and coho salmon fisheries (SWs 26-36). The catch of sockeye salmon was below average and the coho salmon harvest was above average. Without a directed Chinook salmon fishery, the overall poor abundance of Chinook salmon, and the management measures implemented during the sockeye salmon fishery which were intended to reduce the harvest of Chinook salmon, the catch of large and nonlarge Chinook salmon was well below average.

Typically, the effort in the directed Chinook salmon fishery averages a total of 168 licence days but there was no commercial Chinook fishery in 2017. Sockeye salmon were targeted for a total of 242 licence days, below the average of 311 licence days. The coho salmon fishery was opened for a total of 75 licence days, below the average of 96 licence days.

The stock composition of the lower river commercial fisher sockeye salmon harvest was 8,763 enhanced Tahltan fish, which accounted for $26.5 \%$ of the sockeye salmon harvest; 14,060 wild Tahltan sockeye salmon accounting for $42.5 \%$ of the harvest; 6,325 mainstem fish accounting for $20.9 \%$ of the harvest; and, 3,701 enhanced Tuya sockeye salmon accounted for $10.1 \%$ of the harvest (Table 3).

Typically, weekly Chinook and sockeye salmon guideline harvests, based on SCMM, SMM and MR forecasts of the TAC apportioned by average run timing and domestic and international allocation agreements, are developed each week to guide management decisions during the Chinook and sockeye salmon seasons. For 2017, weekly inseason run projections for Chinook salmon were not made as assessment information was largely absent due to the poor run size (which meant poor catches at Kakwan Point - influenced the SCMM) and the decision to limit all Chinook salmon harvest; therefore, reducing the likelihood that sufficient tags would be recovered to provide for inseason MR estimates. In most years, after SW 25, for the purpose of managing the lower river catch, 800 large Chinook salmon are allocated to the upper Stikine River fisheries. The allocation consists of 100, 20, and 680 large Chinook salmon in the recreational, upper commercial and aboriginal fisheries, respectively. In 2017, the allocation of Chinook salmon to the respective fisheries was not made as restrictions were put in place to reduce the harvest of Chinook salmon in all fisheries. A total of 8,000 sockeye salmon was allocated to the upper Stikine River commercial and AF. The remaining balance of the sockeye salmon TAC was allocated to the lower Stikine River commercial fishery. Particular attention was directed at the inriver run and escapement projections of the various sockeye salmon stock groupings. From SW 26 through SW 30, management emphasis was on the Tahltan and Tuya lake sockeye salmon stock groupings, after which time the sole focus was the management of mainstem sockeye salmon stocks through the end of the sockeye salmon fishery in SW 34. Unlike past years but similar to 2015 and 2016, the switch to the
mainstem sockeye management commenced in SW 31 versus SW 30. This action was in response to the continued relative strength of the Tahltan sockeye stock groupings beyond SW 29. The coho salmon management regime began on SW 35.

The preseason forecast of 18,300 large Chinook salmon was below the treaty agreed to threshold run size of 28,100 fish that would trigger a directed fishery. Therefore, a targeted commercial fishery was not prosecuted by Canada in 2017. In response to the poor Chinook salmon forecast and inseason escapement concerns, Canada made the decision to implement restrictions/modifications to the management of the directed sockeye salmon fishery in the lower Stikine River. If Chinook salmon escapement had not been a concern in 2017, the directed sockeye fishery would have opened on 18 June (SW 25) but in response to the Chinook salmon situation, the sockeye fishery did not commence until 26 June (SW 26) to allow for the majority of the Chinook salmon return to pass through the lower Stikine River. Additionally, licence holders were asked to release any large Chinook salmon deemed healthy (i.e. not gilled) that were incidentally caught in the sockeye salmon fishery. Openings in SW 26 were restricted to the daylight period to allow for set net use with a maximum of 30 minute soak times before picking the net in an effort to facilitate the release of healthy large Chinook salmon. The maximum mesh size for the directed sockeye salmon fishing period was kept at 14.0 cms ( $\sim 5.5$ inch) until the start of the coho salmon management period (SW 35) to further reduce interceptions and avoid gilling large Chinook salmon.
(Note: some of the catch figures listed in the following narrative may not match the final catch records listed in the tables. This is due to slight changes in the catches as a result of a postseason check of the catch slips, updated stock composition information, and assessment of Chinook salmon large versus nonlarge size ratios.)

In SW 26, the fishery opened (delayed by nine days) for sockeye salmon which was centered on the Tahltan stock group and was expected to remain so until SW 29. Fishers were permitted one net only and the commercial fishing area remained the same as recent years, which was from the Canada/U.S. border upstream to a location near the mouth of the Porcupine River. The area included the lower 10 km reach of the Iskut River. The use of set nets was permitted as along as net checks occurred no less than every 30 minutes. In order to facilitate the requirement, openings were restricted to daylight periods only to ensure fisher safety. The overall Canadian sockeye salmon AC of 64,600 including approximately 42,500 Tahltan Lake sockeye salmon, 9,200 Tuya Lake sockeye salmon and 10,300 mainstem sockeye salmon was based on the preseason run size expectation of 185,000 fish.

The fishery was posted for an initial 12 hrs period commencing Tuesday noon, 27 June (SW 26). The guideline catch for sockeye salmon was 7,300 fish (including ~4,600 Tahltan Lake sockeye salmon). Tahltan catch rates were above average for the first fishing period (93\% small egg fish) while Chinook salmon catches were negligible. The decision was made to extend the fishery for three more 18 hrs periods. Catch rates continued to be above average for the remainder of the fishing period. Catches for the week were 59 large Chinook salmon and 4,152 sockeye salmon, including $\sim 3,400$ Tahltan Lake sockeye
salmon. The total weekly sockeye salmon harvest was comprised of $81 \%$ Tahltan, $12 \%$ Tuya, and $7 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon fbd was 113 versus an average of 57 fbd .

The fishery was posted for an initial 72 hrs period in SW 27 with a sockeye salmon guideline harvest of 12,100 fish, including 9,400 Tahltan Lake sockeye salmon. The weekly guideline was based on the preseason forecast. The harvest of approximately 2,500 Tahltan/Tuya sockeye salmon and low Chinook salmon catches after day 2 indicated that there was room to extend the fishery. The average fbd of Tahltan Lake sockeye salmon prompted the decision to add an additional 24 hrs. The fishing conditions were very good due to below average and stable water levels. The final catches for the week consisted of 81 large Chinook, 157 nonlarge Chinook, and 5,767 sockeye salmon; including ~4,800 Tahltan Lake origin fish which was below the weekly guideline. The total weekly sockeye salmon harvest was comprised of $83 \%$ Tahltan, $14 \%$ Tuya, and $3 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon fbd was 117 which is the current average.

In SW 28 the fishery was posted for an initial 72 hrs period with a guideline harvest of $\sim 6,000$ sockeye salmon including 4,500 Tahltan Lake sockeye salmon. The run size generated from the SMM in SW 27 of 140,000 sockeye salmon included ~79,000 Tahltan Lake origin fish which was below the preseason forecast. Catch rates after day 2 continued to be well above average for this period (151 fbd versus 98) and the Tahltan/Tuya composition was holding at $94 \%$, based on this, the fishery was extended for 24 hrs. The catch for the week consisted of 85 large Chinook and 7,575 sockeye salmon, including a harvest of $\sim 6,100$ Tahltan Lake sockeye salmon. The Chinook salmon harvest was well below average for SW 28. The harvest of Tahltan sockeye salmon was above the guideline. The total weekly sockeye salmon harvest was comprised of $81 \%$ Tahltan, $11 \%$ Tuya, and $8 \%$ mainstem sockeye salmon. The week's Tahltan Lake sockeye salmon fbd of 139 was well above average. Week 28 marks the historical peak of the Tahltan Lake sockeye salmon through the fishery; catches to date indicated the run timing appeared to be normal.

In SW 29 the fishery was posted for an initial 72 hrs opening with a guideline harvest of $\sim 5,800$ sockeye salmon, including 4,500 Tahltan sockeye salmon. This week's run size estimate indicated a run size of approximately 142,000 sockeye salmon. The Tahltan Lake component was estimated at 87,000 fish, below the preseason forecast but consistent with inseason information to date. Continued above average catch rates for Tahltan Lake sockeye after 2 days of fishing prompted a 24 hrs extension. This week's effort yielded a harvest of 41 large Chinook and 6,137 sockeye salmon. The Tahltan Lake sockeye salmon harvest of 3,900 fish was below the guideline harvest for the week. The total weekly sockeye salmon harvest was comprised of $63 \%$ Tahltan, $12 \%$ Tuya, and $25 \%$ mainstem sockeye. Historically SW 29 marked the end of the Tahltan Lake sockeye salmon management regime; however, given the relative strength of Tahltan sockeye salmon (Tuya fish to a lesser degree), it was decided that Tahltan sockeye salmon abundance would govern management decisions into SW 30 as has been the case in recent years.

In SW 30 the fishery management regime remained focused on Tahltan Lake sockeye salmon abundance. The fishery was posted for an initial 48 hrs period with a guideline
harvest of $\sim 3,400$ sockeye salmon, including 2,600 Tahltan Lake sockeye. Again, the run size estimate was based on the SMM for the week. The terminal run estimate had decreased slightly to $\sim 142,000$ sockeye salmon, of which 89,000 were Tahltan fish. The continued strong catch rates after day one plus a Tahltan/Tuya composition of $73 \%$ prompted a 24 hrs extension. The harvest for the week was 24 large Chinook and 3,917 sockeye salmon, including a Tahltan Lake sockeye salmon harvest of 2,422 fish. The Tahltan Lake sockeye salmon harvest was below the weekly guideline. The total weekly sockeye salmon harvest was comprised of $62 \%$ Tahltan, $8 \%$ Tuya, and $30 \%$ mainstem sockeye salmon. The Tahltan Lake sockeye salmon fbd was well above average ( 73 vs .47 fbd ), whereas the mainstem sockeye salmon fbd of 36 fish was below the average of 58 fish for this period, indicating that the mainstem sockeye salmon return may be below the forecast $(\sim 51,000)$. The fishery was conducted under below average water levels.

In SW 31, management decisions switched from a focus on Tahltan Lake sockeye salmon abundance to the abundance of mainstem sockeye salmon. The fishery was posted for an initial 48 hrs opening with a guideline harvest of $\sim 2,100$ sockeye salmon of which 600 were mainstem sockeye salmon. The run size projection increased slightly to $\sim 143,000$ sockeye salmon based on the SMM but the mainstem projection had diminished to $\sim 38,000$ fish which was well below the preseason expectation. The increase in overall run size was driven primarily by the above average contribution of Tahltan Lake sockeye salmon in SW 30 and this had a negative impact on the mainstem sockeye salmon projection. The day one harvest of $\sim 400$ mainstem sockeye salmon and below average mainstem catch rates prompted the decision to hold the fishery at 48 hrs in light of the poor SMM projection. The weekly harvest was 11 large Chinook, 21 coho, and 2,455 sockeye salmon, including 1,097 mainstem fish. The total weekly sockeye salmon harvest was comprised of $53 \%$ Tahltan, 2\% Tuya, and 45\% mainstem sockeye salmon. The mainstem sockeye salmon fbd of 50 was below the average of 59 fbd .

In SW 32, the fishery was posted for 24 hrs period with a guideline harvest of $\sim 500$ mainstem sockeye salmon. The TAC was based on an overall run size projection of $\sim 148,000$ sockeye salmon including 37,000 mainstem sockeye salmon generated by the SMM which was similar to the previous estimate. Consideration for an extension was not given due to the current mainstem sockeye salmon projection and weak CPUE for mainstem fish based on a 20 hrs hail for day one. The fishery was conducted under slightly below average water levels and harvested 4 large Chinook, 51 coho, and 632 sockeye salmon, including a mainstem sockeye salmon catch of 319 fish. The mainstem sockeye salmon fbd was 32 versus an average of 57 fbd .

In SWs 33 and 34, the fishery was held to a 24 hrs period for each of the weeks. Terminal run projections made by the SMM had improved somewhat to $\sim 154,000$ sockeye salmon with only 38,000 of those being mainstem fish. By the end of SW 34, Canada had harvested $\sim 6,800$ mainstem sockeye salmon which was above an AC of $\sim 2,800$. Catch rates for mainstem sockeye salmon improved to average for SW 33 and above average for SW 34 which were 36 and 44 fbd respectively. Fishing conditions were generally good with near average water levels and effort dropped from 11 licences in SW 33 to only 7 licences in SW 34.

In SW 35, the fishery was opened for an initial 72 hrs period with the management objective focused on coho salmon abundance. A total of 11 licences were fished. The guideline harvest on coho salmon was 5,000 fish for the season with the intention of spreading the harvest over SW 35 and 36. The CPUE in the commercial fishery was 60 fbd above the average of 34 . After 2 days of fishing, the fishery was extended for 24 hrs. The harvest was 2,512 coho and 857 sockeye salmon, $\sim 75 \%$ were mainstem sockeye salmon.

In SW 36, the fishery was opened for an initial 72 hrs period. A total of 11 licences fished for the week. After 2 days of fishing and a harvest of $\sim 1,700$ coho salmon, the fishery appeared to be on track to reach the 5,000 directed coho salmon target and no further fishing time was provided. The final week of the fishery yielded a harvest of 2,471 coho and 295 sockeye salmon, $\sim 92 \%$ were mainstem sockeye salmon. The final coho salmon harvest was 5,502 fish, 519 of which were taken in the course of the sockeye salmon fishery and, therefore, not counted toward the 5,000 fish allocation as prescribed in the PST.

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. A total of 322 sockeye and no large Chinook salmon were caught in 2017, which was below the averages. The fishing effort of 8 boat days fished was below average. Generally, fishery openings were based on the lower Stikine commercial fishery openings, lagged one week.

## Aboriginal Fishery

The upper Stikine AF fishery, which is located near Telegraph Creek, B.C., harvested 281 large Chinook, 178 nonlarge Chinook and 8,578 sockeye salmon in 2017. The harvest of large Chinook salmon was below average. The harvest of sockeye salmon was the third highest on record. The catch was largely comprised of Tahltan Lake sockeye salmon run. Fishing conditions were good and effort was above average.

## Recreational Fishery

The Stikine River salmon recreational fishery targets primarily Chinook salmon and its principal fishing location is located at the mouth of the Tahltan River. Minor sport fishing activities occur in upper reaches of the Tahltan River and in some tributaries of the Iskut River, including Verrett and Craig rivers. In 2017, there was no harvest of large Chinook salmon in the recreational fishery. Restrictions were in place starting April 01 that did not permit the retention of Chinook salmon over 65 cms in the waters of the Stikine River. Additionally, the Tahltan River was closed to salmon fishing until further notice effective June 01 in an attempt to protect spawning Chinook salmon. Access to the fishing sites near the mouth of the Tahltan River was restricted by the Tahltan First Nation Chief and Council in order to limit recreational harvest on Little Tahltan River bound Chinook salmon.

## Escapement

## Sockeye Salmon

A total of 19,241 sockeye salmon were counted through the Tahltan Lake weir in 2017, below the average weir count of 25,922 fish, but within the escapement goal range of 18,000 to 30,000 fish. An estimated 10,044 fish (54\% of the escapement- broodstock estimate) originated from the fry-stocking program, which was dissimilar to the $36 \%$ contribution observed in smolts leaving the lake in 2014; the principal smolt year contributing to the 2017 return. A total of 2,909 sockeye salmon were collected for brood stock and 0 fish were collected for stock identification purposes at the weir (due to low escapement concerns) resulting in a natural spawning escapement of 16,332 sockeye salmon in Tahltan Lake.

Although remedial work was done at the Tahltan River landslide in March 2015, the site remains a potential challenge at both high and very low water flows for both Chinook and sockeye salmon migrating to their respective spawning grounds above the landslide. Sockeye salmon migration did not appear to be impaired by the slide in 2017. However, Decheeka Falls which is located at the top end of a small canyon above the Little Tahltan River confluence with the Tahltan River may also be a potential barrier at low water flows. On 12 September, a helicopter was used to observe and record video of sockeye salmon attempting to pass the falls. There were 42 attempts in a 30 second time span leading to an assumption that sockeye salmon were having a difficult time negotiating the falls.

The spawning escapements for the mainstem and Tuya stock groups are calculated using stock identification, test fishery, and inriver commercial harvest data. The mainstem sockeye salmon escapement estimate was 11,678 fish, below the average escapement, well below the target escapement of 30,000 fish, and below the escapement goal range of 20,000 to 40,000 fish. The Tuya excess estimate was 583 sockeye salmon.

Aerial survey counts of mainstem sockeye salmon were well below average in 2017 which is to be expected given the low escapement estimate of mainstem fish. The one bright spot was the Chutine River index site with a count nearly 4 times higher than the average.

## Chinook Salmon

In order to assess inriver Chinook salmon abundance in 2017, a MR study was conducted concurrently with the SCMM. Inseason MR estimates for large Chinook salmon were not calculated in 2017 due to the low number of marks deployed and low catches experienced in inriver fisheries and spawning ground survey sites. The postseason Stikine River spawning escapement estimate of 7,206 large Chinook salmon was based on tag recoveries from Chinook salmon bycatch in directed commercial fisheries and spawning ground recoveries. This was below the average escapement of 17,118 large fish, and below the escapement goal range of 14,000 to 28,000 large Chinook salmon.

The 2017 Chinook salmon escapement enumerated at the Little Tahltan River weir was 428 large fish and 311 nonlarge Chinook salmon. The escapement of large Chinook salmon
in the Little Tahltan River was below the average of 1,072 fish and below the lower end of the Canadian escapement goal range of 2,700 to 5,300 large fish. This was the eleventh consecutive year that the Canadian escapement goal range was not reached.

Lower water flows and observation of successful Chinook salmon passage at the site of the 2014 Tahltan River landslide suggest that the landslide was not a significant migration barrier in 2017.

The Little Tahltan River weir count represented approximately 6\% of the total Stikine River large Chinook salmon escapement, close to the average weir count contribution of $7 \%$. Note that this average has declined significantly in the last ten years; for comparison the average weir count contribution from 1996-2006 was 20\%.

A carcass pitch crew was stationed Verrett Creek from 5-9 August and sampled 9 large and 13 nonlarge Chinook salmon.

The Chinook salmon aerial survey did not occur in 2017 due to budgetary constraints.

## Coho Salmon

The annual coho salmon aerial survey was conducted on November 3 under generally favorable viewing conditions; very low water was encountered at a number of sites. However, the total count of coho salmon observed at six index sites was only 292 fish, well below average. The reason for the very low survey counts is unclear. The inseason weekly CPUE of coho salmon from the lower Stikine River Canadian fishery was above average.

A coho salmon drift gillnet test fishery was not conducted in 2017 due to budgetary constraints.

## Sockeye Salmon Run Reconstruction

The postseason estimate of the terminal Stikine River sockeye salmon run was 98,768 fish. Of this number, approximately 63,347 fish were of Tahltan Lake origin (wild \& enhanced), 9,202 fish were of Tuya origin (fry from Tahltan brood stock stocked into Tuya Lake), and 26,220 fish were mainstem (Table 3). These estimates are based on postseason data, including otolith recovery and GSI analysis in the U.S. Districts 106 and 108 harvests, harvest data from the inriver Canadian commercial, Aboriginal, and test fisheries, and final escapement data. Inriver stock composition data are from inseason egg diameter and inseason and postseason otolith analysis. The 2017 terminal run was below average and also well below the preseason forecast of 185,000 fish.

## TAKU RIVER

Taku River salmon are harvested in the U.S. gillnet fishery in Alaskan District 111, in the northern Southeast Alaska seine and troll fisheries, in the Juneau area sport fishery, and in the inriver personal use fishery. Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an AF, and a sport fishery (Figure 2).

Figure 2. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Regulations

Fishing arrangements in place as a result of Annex IV, Chapter 1 of the PST can be found at: http://www.psc.org/pubs/treaty.pdf. For salmon originating in the Canadian portion of the Taku River watershed, these arrangements include the continuation of directed fisheries for Taku River Chinook salmon stocks, first implemented in 2005; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the production of enhanced fish.

## U.S. Fisheries

The traditional District 111 commercial drift gillnet salmon fishery was open for a total of 43 days from June 18 through September 18, 2017. The harvest totaled 1,080 Chinook, 113,614 sockeye, 15,988 coho, 230,195 pink, and 885,661 chum salmon. Harvests of sockeye, pink, and chum salmon were above average, while harvests of Chinook and coho salmon were below average. The traditional fishery does not include harvests from the Speel Arm SHA inside Port Snettisham. This hatchery access fishery was not opened in 2017 resulting in no additional salmon harvests in District 111.

The 2017 season was the eighteenth year of adult sockeye salmon returns to the Snettisham Hatchery inside Port Snettisham. These fish contributed to the traditional harvests in Taku Inlet, Stephens Passage, and the entrance of Port Snettisham, the latter being open from SW 33-38. This was the third year of full production for DIPAC's revitalized enhanced coho salmon program and these fish contributed a modest amount, compared to the past two seasons, to the traditional harvests in Taku Inlet. Hatchery stocks contributed substantially to the total harvest of sockeye and chum salmon and more minimally to the harvest of Chinook and coho salmon.

A bilateral review of the escapement goal for Taku River large Chinook salmon completed in early 2009 resulted in a revised escapement goal range of 19,000 to 36,000 fish. The adjusted 2017 preseason terminal run forecast of 13,300 Taku River large Chinook salmon provided no AC for directed fisheries by either country. No Chinook salmon inriver assessment fishery was conducted, however drifted tangle nets were used near the confluence of the Wright River to spaghetti and radio tag fish in order to allow for a markrecapture estimate and potentially give some sense of inseason run abundance based off of catch rates. With no reliable way of estimating inseason run size, both countries managed their early season sockeye salmon fisheries based off the preseason Chinook salmon forecast. Management actions in the District 111 drift gillnet fishery due to Chinook salmon conservation concerns occurred to some extent in the first four directed sockeye salmon openings, but were particularly restrictive in SWs 25 and 26 with a significant area closure including most of Taku Inlet and waters extending further south and west in SW 25 and two day openings in Taku Inlet and a six-inch maximum mesh restriction in place throughout the district in SWs 25 and 26. Commercial spring troll fisheries throughout the region were reduced in time and area initially and then shut down completely beginning May 29, and Chinook salmon nonretention in the sport fishery was in effect in northern inside waters from April 15 through June 14. The personal use sockeye salmon fishery on the U.S. side of the Taku River was also delayed by nine days starting on July 10. The 2017

District 111 drift gillnet Chinook salmon harvest in SWs 25-29 was 875 fish of which $35 \%$ were large fish. Taku River large Chinook salmon harvest estimates based on CWT analysis are 0 fish in the sport and 250 fish in the District 111 drift gillnet and personal use fisheries. Postseason GSI analysis indicates that $46 \%$ of the District 111 drift gillnet large Chinook salmon harvest (143 fish) was of Taku River origin through SW 29. The Juneau area sport harvest of Taku River large Chinook salmon was estimated at 34 fish during the same time period based on GSI analysis. The MR estimate of Taku River spawning escapement is approximately 8,750 large Chinook salmon.

The traditional District 111 sockeye salmon harvest of 113,614 fish was above average. Weekly sockeye salmon CPUE was generally below average to average from SWs 25 through 33 after which it increased to several times the average through the end of the season in SW 38. Snettisham Hatchery sockeye salmon stocks began to contribute to the traditional fishery in SW 26 and otolith sampling occurred through SW 35 in Taku Inlet and through SW 34 in Stephens Passage. Of the total traditional District 111 sockeye salmon harvest, $74 \%$ occurred in and around Taku Inlet (average is 68\%), 23\% occurred in Stephens Passage south of Circle Point, including Section 11-C (average is 25\%) and $2 \%$ occurred in Port Snettisham (average is 7\%). The contributions of Taku River wild, Taku River enhanced, Port Snettisham enhanced, and other sockeye salmon stocks were derived from estimates based inseason on otolith analysis and postseason from estimates based on GSI and otolith analyses. The postseason GSI and otolith analysis estimates of stock composition of the harvest of sockeye salmon in the traditional District 111 drift gillnet fishery are 67,706 (61\%) wild Taku River, 6,029 (5\%) enhanced Tatsamenie and King Salmon lakes, 32,645 (29\%) Snettisham Hatchery fish, and 4,642 (4\%) domestic wild fish.

Table 4. Taku River sockeye salmon run reconstruction, 2017. Estimates do not include spawning escapements below the U.S./Canada border.

Opportunity to target returning Snettisham Hatchery sockeye salmon inside Port Snettisham began in SW 33 with a significant pulse of Speel Lake wild sockeye salmon through the weir and another large group observed in the stream below the weir. Escapement through the weir slowed dramatically after this and no opportunity was provided in the Speel Arm SHA due to the lower bound of the Speel Lake escapement goal range not being met. The entrance of Port Snettisham (statistical area 111-34) had well below average effort and sockeye salmon harvest with generally poor returns of Snettisham Hatchery fish.

Coho salmon stocks harvested in District 111 include returns to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams, as well as Alaskan hatchery release sites. In early 2015, an escapement goal range of 50,000 to 90,000 Taku River coho salmon with a 70,000 fish point goal was adopted. The U.S. management intent in 2017 was to pass 75,000 coho salmon above border to provide for escapement and a 5,000 fish assessment fishery, allowing Canada to harvest any fish surplus to the 70,000 fish
escapement goal. The 2017 preseason inriver run forecast of 117,000 Taku River coho salmon was above the average inriver run of 99,300 fish. The traditional District 111 coho salmon harvest of 16,002 fish was $43 \%$ of the 37,233 fish average and the smallest harvest since the 2000 season. DIPAC enhanced coho salmon first appeared in the District 111 harvest in SW 34 but never comprised more than 15\% of a weekly harvest. CWT analyses indicate DIPAC enhanced coho salmon contributed approximately 670 fish or $4 \%$ of the 2017 District 111 drift gillnet harvest.

Management of the District 111 drift gillnet fishery is based on Taku River wild sockeye salmon abundance in SWs 25-33 and on Taku River wild coho salmon abundance in SWs 34-42. The 2017 fishery began by regulation in SW 25. Management actions were limited to imposing restrictions in time, area, and gear. Because there is no bilaterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fish wheel catches. As the fishing season progresses, sufficient data is acquired to estimate the inriver run size from the inriver MR program using the Canyon Island fish wheels as event 1 and the Canadian inriver fishery as event 2 , and to use that estimate in conjunction with historical migratory timing and fishery harvest data to project the seasons Taku River sockeye salmon terminal run size. In the first week of sockeye salmon management starting June 18, Taku Inlet and Stephens Passage were opened with restrictions in time, area, and gear due to Chinook salmon conservation concerns. The opening was limited to two days with a six-inch maximum mesh size restriction and an area restriction that closed Taku Inlet north of the latitude of Greely Point and extended south and west to include waters in the vicinity of Point Bishop and Point Arden. Effort was approximately half of average for the week with 18 boats fishing. The sockeye salmon harvest was $50 \%$, and the CPUE was $97 \%$ of average. The total Chinook salmon harvest was 239 fish with approximately 50 fish estimated as Taku River origin large fish based on inseason CWT analysis and ASL sampling.

Section 11-B was opened for two days in Taku Inlet, with waters north of Jaw Point closed, and three days in Stephens Passage in SW 26 with no time extensions and a six-inch maximum mesh size restriction throughout to minimize Chinook salmon interception. The two-day opening in Taku Inlet was largely for Chinook salmon conservation but also for concerns over early Taku River sockeye salmon stocks, particularly the Kuthai Lake stock which had an extremely weak dominant parent-year escapement in 2012. The three days of fishing in the district was slightly above average for the week. Thirty-three boats harvested 187 Chinook salmon of which an estimated 81 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. The sockeye salmon harvest and CPUE were $58 \%$ and $86 \%$ of average, respectively.

Section 11-B was again opened for two days in Taku Inlet and three days in Stephens Passage in SW 27. Due to an average-sized fleet, uncertainty in Taku River sockeye salmon run strength, and significant chum salmon catch rates, both areas were extended for an additional day with modified restrictions in Taku Inlet closing all waters north of Greely Point and including a 6 -inch minimum mesh size restriction to reduce harvest of Taku River sockeye salmon. The six-inch maximum mesh size restriction was rescinded this week, but the Jaw Point closure in Taku Inlet remained in place to protect milling Chinook
salmon near the Taku River flats. The four days fishing was open in the district was above average. Effort increased from the previous week to 80 boats, $121 \%$ of average, which harvested 240 Chinook salmon, of which an estimated 18 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. Sockeye salmon harvest and CPUE dropped from the previous week to $57 \%$ and $37 \%$ of average, respectively. Otolith analysis revealed that $7 \%$ of the sockeye salmon harvest from Taku Inlet, and 37\% from Stephens Passage, were of Snettisham Hatchery origin. The inseason mark-recapture estimate generated midweek in SW 27, with minimal data, to inform the decision for the SW 28 opening projected an inriver run of 65,000 Taku River sockeye salmon.

The initial opening for SW 28 was again two days in Taku Inlet and three days in Stephens Passage with continued low sockeye salmon abundance- as indicated by below average catches in the District 111 fishery, stock assessment fish wheels, and Canadian commercial fishery the previous week- resulting in reduced fishing time in Taku Inlet. A 6-inch minimum mesh size restriction was implemented south of Circle Point in Stephens Passage, which would stay in place through SW 33, to minimize harvest of Port Snettisham wild sockeye salmon returns while still allowing opportunity to target enhanced chum salmon. A one-day extension in Stephens Passage was granted, with the minimum mesh size restriction in place, for a total of an above average four days of fishing in the district. One hundred thirty-six boats, the highest weekly effort of the season and $144 \%$ of average, harvested 111 Chinook salmon, of which an estimated 38 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. Sockeye salmon harvest and CPUE were $67 \%$ and $37 \%$ of their respective averages. Otolith analysis revealed that $13 \%$ of the sockeye salmon harvest from Taku Inlet, and $57 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie and King Salmon lakes origin made up 6\% of the Taku Inlet harvest. The first bilateral Taku River sockeye salmon run size estimate was produced this week and projected an inriver run of 82,000 fish which extrapolated out to a terminal run of 117,000 fish, significantly smaller than the Canadian preseason forecast of 198,000 fish. The inseason total District 111 gillnet harvest for the Chinook salmon accounting period, SW 18-29, was 187 Taku River large Chinook salmon based on CWT analysis and the final contribution based on GSI analysis was 143 fish.

Table 5. U.S. inseason weekly estimates of traditional D111 drift gillnet Taku River wild sockeye salmon inriver run size, projected terminal run size, and resulting TAC for 2017.

| Stat <br> Week | Inriver <br> Run | Terminal <br> Run | Total <br> TAC | US <br> TAC | Projected <br> US harvest |

| 35 | 120,514 | 146,922 | 71,922 | 55,380 | 37,032 |

${ }^{\text {a}}$ Forecast based on estimate including entire weeks data.
Fishing time for SW 29 was again initially two days in Taku Inlet and three days in Stephens Passage with Taku River sockeye salmon run size indicators both in District 111 and inriver suggesting a weaker run than forecast. The Jaw Point line in upper Taku Inlet was removed for this opening as returning Taku River Chinook salmon were nearly entirely in the river based on historical run timing. Section 11-C, southern Stephens Passage, was opened this week to allow opportunity for targeting pink salmon with indications of solid abundance throughout the northern portion of the region. A one-day extension in Stephens Passage, with the minimum mesh size restriction, and Section 11-C was granted for a total of an above average four days of fishing in the district. Effort decreased from the previous week with 120 boats making landings, slightly above average. The sockeye salmon harvest for the opening was $112 \%$ of average while CPUE was $68 \%$ of average. Otolith analysis revealed that $11 \%$ of the sockeye salmon harvest from Taku Inlet, and $49 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie and/or King Salmon lakes origin made up 5\% and 2\% of the harvest in Taku Inlet and Stephens Passage, respectively. The weekly Taku River sockeye salmon inriver run size projection dropped from the previous week to 78,000 fish although inriver abundance appeared to improve towards the end of the week with increased fish wheel catches.

Initial fishing time for SW 30 was a repeat of the previous four openings with two days in Taku Inlet and three days in Stephens Passage (including Section 11-C). Even though District 111 sockeye salmon CPUE had increased substantially the previous week, inriver abundance was still below average when the opening was decided on Thursday. With sockeye salmon CPUE in District 111, fish wheel daily catches, and CPUE in the Canadian commercial fishery above average this week, a one-day extension was granted in Taku Inlet and Stephens Passage (including Section 11-C). The four total days of fishing in the district was above average for the week, and the three days fished in Taku Inlet was the
first above average time period of the season there. Effort increased slightly from the previous week to 126 boats, $105 \%$ of average for the week. The sockeye salmon harvest was $134 \%$ of average while CPUE was $94 \%$ of average. Otolith analysis revealed that $26 \%$ of the sockeye salmon harvested in Taku Inlet and $54 \%$ of the harvest in Stephens Passage were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up 5\% and 2\% of the harvest in Taku Inlet and Stephens Passage, respectively. The weekly Taku River sockeye salmon inriver run size projection increased substantially from the previous week to 113,000 fish.

Fishing time for SW 31 was initially three days in Taku Inlet and Stephens Passage (including Section 11-C) with a solid Taku River sockeye salmon run size projection and above average sockeye salmon CPUE in District 111 the previous week. With above average sockeye salmon CPUE continuing this week throughout the district and Taku River sockeye salmon abundance trending up, both Taku Inlet and Stephens Passage were extended for an additional day for an above average total of four days of fishing for the week. Effort decreased slightly from the previous week to 120 boats, $118 \%$ of average, and sockeye salmon harvest and CPUE were $158 \%$ and $113 \%$ of their respective averages. The sockeye salmon harvest this week of 25,500 fish was the highest weekly harvest of the season. Otolith analysis revealed that $29 \%$ of the sockeye salmon harvested in Taku Inlet and $45 \%$ of the harvest in Stephens Passage were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up 6\% and 5\% of the harvest in Taku Inlet and Stephens Passage, respectively. The weekly Taku River sockeye salmon inriver run size projection fell slightly from the previous week to 104,000 fish.

Fishing time for SW 32 was initially three days in Taku Inlet and Stephens Passage (including Section 11-C) with above average sockeye salmon CPUE in District 111 the previous week aided by a rapidly declining fleet size throughout the opening, and a good inriver sockeye salmon run projection. With below average sockeye salmon harvest and CPUE this week, no extensions were given for the first time since SW 26. Effort fell from the previous week to 96 boats, but was still $120 \%$ of the average for the week. Expectations of increasing Port Snettisham Hatchery sockeye salmon returns, based on previous seasons, likely kept effort higher than normal. Sockeye salmon harvest and CPUE were $58 \%$ and $56 \%$ of their respective averages. Otolith analysis indicated that $32 \%$ of the sockeye salmon harvest from Taku Inlet and 57\% from Stephens Passage were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up 7\% and 2\% of the harvest in Taku Inlet and Stephens Passage, respectively. The weekly Taku River sockeye salmon inriver run size projection increased slightly from the previous week to 111,000 fish.

Fishing time for SW 33 was initially three days in Taku Inlet and Stephens Passage with a significantly reduced fleet size and an increasing inriver sockeye salmon run projection resulting in a near average initial opening in District 111. The opening was delayed to Monday, August 14 this week to accommodate the Golden North Salmon Derby taking place in Juneau area waters. Section 11-C was closed this week and would not open the remainder of the season due to slow building pink salmon escapements in mainland creeks. Attention was turned to returning Port Snettisham Hatchery sockeye salmon early in the
opening due to nearly 1,700 fish transiting through the Speel Lake weir in a 24 -hour time period. This escapement of wild Speel Lake sockeye salmon, which built to nearly 2,000 fish with another 1,000 fish estimated below the weir by Tuesday, resulted in time and area extensions and the rescinding of the 6-inch minimum mesh size restriction south of Circle Point for the remainder of the season. Taku Inlet and Stephens Passage had an above average total of four days of fishing and the entrance to Port Snettisham was opened for the first time this season for a three-day period. Many of the 61 boats fishing in the district this week traveled to the Port Snettisham vicinity after the area extension was announced only to head back to the more productive fishing nearer the Taku River. Sockeye salmon harvest and CPUE were $83 \%$ and $100 \%$ of their respective averages. Otolith analysis indicated that $34 \%$ of the sockeye salmon harvest from Taku Inlet and $88 \%$ from Stephens Passage were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up 8\% of the harvest in Taku Inlet. The weekly Taku River sockeye salmon inriver run size projection increased again from the previous week to 119,000 fish, and with $90 \%$ of the run historically through Canyon Island at this juncture in the season, it appeared that the upper end of the spawning objective goal range would be exceeded. This was the last week of the sockeye salmon management period in District 111 with coho salmon management starting in SW 34. The first Taku River coho salmon inriver run estimate was produced this week and expanded by average run timing projected an above border run of 72,000 fish, well below the preseason forecast of 117,000 fish.

The fall drift gillnet season in District 111 occurred over five weeks, beginning on August 20 in SW 34, and ending on September 18 in SW 38. During this time, management in District 111 switches from being driven by Taku River sockeye to Taku River coho salmon abundance.

Fishing time for SW 34 was set for three days in Taku Inlet, Stephens Passage, and the entrance to Port Snettisham with continued above average abundance of Taku River sockeye salmon but indications that returns of coho salmon were average to below average. No additional time was given based on substandard coho salmon abundance. Much of the effort this week was targeting returns of Snettisham Hatchery sockeye salmon using smaller mesh size nets south of Circle Point with the minimum mesh size restriction having been rescinded the previous week. A total of 56 boats made landings throughout the week which was $132 \%$ of average. The sockeye salmon harvest was $235 \%$ of average, while CPUE was $180 \%$ of average. Otolith analysis indicated that $34 \%$ of the sockeye salmon harvest from Taku Inlet and $47 \%$ from Stephens Passage were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie and/or King Salmon lakes origin made up $9 \%$ and $6 \%$ of the harvest in Taku Inlet and Stephens Passage, respectively. The coho salmon harvest and CPUE were $68 \%$ and $54 \%$ of average, respectively. The second Taku River coho salmon inriver run estimate was produced this week and expanded by average run timing projected an above border run of 75,000 fish, a slight increase from the previous week.

Fishing time in Section 11-B for SW 35 was again set for three days with the same area open as the previous week. With coho salmon CPUE increasing towards the end of the previous week's opening in District 111, but inseason run size projections remaining low,
a slightly below average amount of time was given. A total of 43 boats made landings throughout the opening, $98 \%$ of average, with all but a few boats fishing in Taku Inlet. Sockeye salmon harvest and CPUE were nearly three times their respective averages and otolith analysis revealed that enhanced fish made up $21 \%$ and $11 \%$ of the Taku Inlet harvest from Snettisham Hatchery and Tatsamenie Lake, respectively. The contribution of enhanced sockeye salmon returning to Tatsamenie Lake in the harvest this week was the largest weekly proportion of the season. This was the last week of sockeye salmon otolith sampling for the season in District 111. Coho salmon harvest and CPUE were $62 \%$ and $69 \%$ of average, respectively. The projected inriver run estimate for Taku River coho salmon decreased from the previous week to 69,000 fish.

Section 11-B was opened for two days in SW 36 with the most recent Taku River coho salmon inriver run size projection below the number the U.S. had agreed to pass into the river, but still within the escapement goal range. A total of 27 boats, $61 \%$ of average, made landings with coho salmon harvest and CPUE at $26 \%$ and $74 \%$ of average, respectively. CWT analysis indicated that $15 \%$ of the coho salmon harvest (approximately 300 fish) was comprised of Alaska hatchery fish, resulting in the largest weekly hatchery coho salmon harvest of the season. The weekly Taku River coho salmon inriver run projection dropped slightly from the previous week once again to 65,000 fish.

Fishing time in SW 37 was again two days in Section 11-B due to a fleet size that was approximately half the average and hatchery coho salmon making up a larger component of the harvest. Effort fell to 15 boats, or $40 \%$ of average, and the coho salmon harvest was $12 \%$ of average while CPUE was $59 \%$ of average. CWT analysis indicated that only $4 \%$ of the coho salmon harvest was comprised of Alaska hatchery fish. The weekly Taku River coho salmon inriver run projection again fell from the previous week to 63,000 fish.

Fishing time in SW 38 was reduced to one day in Section 11-B in preparation for the season closure if coho abundance did not improve dramatically. Effort dropped to 8 boats, approximately one-third of average for the week, with the coho salmon harvest $15 \%$ of average while CPUE was nearly twice the average. CWT analysis indicated that Alaska hatchery fish contributed $12 \%$ to the weekly coho salmon harvest. The weekly Taku River coho salmon inriver run projection fell from the previous week to 57,000 fish. This was the last opening of the season in District 111 and the season ended at noon on Monday, September 18.

The 2017 District 111 fall chum salmon harvest in SWs 34-38 was 125\% of the fall fishing period average. Since seven of the previous ten seasons have ended in SW 41, the 2017 fall chum salmon harvest was above average with approximately three weeks less opportunity. Escapement numbers for Taku River chum salmon are unknown; however, the number of chum salmon caught by the fish wheels at Canyon Island can be used as an index of escapement. The 2017 fish wheel catch of 236 chum salmon (Fish Wheel 1 and 2 only) was $104 \%$ of average and a significant increase from the previous two seasons.

The District 111 traditional drift gillnet pink salmon harvest of 230,000 fish was $162 \%$ of average. Escapement numbers for Taku River pink salmon are unknown; however the
number of pink salmon caught by the fish wheels at Canyon Island can be used as an index of escapement. The 2017 total of 18,520 pink salmon caught in the fish wheels (Fish Wheel 1 and 2 only) was $76 \%$ of the 2015 parent-year catch, $135 \%$ of the 1997-2015 odd-year average, and is the second highest catch since the 2000 season. The pink salmon escapement to the Taku River is characterized as above average.

Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2017. A number of Chinook salmon stocks are known to contribute to the Juneau area sport fishery, including wild fish from the Chilkat River, as well as hatchery stocks, but the major contributor of large, wild fish is the Taku River. Of the Chinook salmon harvested in the sport fishery, 34 fish were estimated to be of Taku River origin through SW 29 based on postseason GSI analysis. Personal use permits were used to harvest an estimated 856 Taku River sockeye salmon along with an estimated incidental harvest of 1 Taku River large Chinook salmon. The District 111 Amalga Harbor SHA common property purse seine fishery, northwest of Juneau, was conducted for the sixth consecutive season to target returning DIPAC enhanced summer chum salmon. There were four total openings in 2017, occurring on Thursdays in July, each lasting six hours. Some portion of the incidental sockeye salmon harvest from these fisheries is assumed to be of Taku River origin, but the magnitude of the contribution is unknown. DIPAC conducted GSI analysis of the 2013 and 2014 harvest with samples averaging 35\% Taku River origin. No GSI analysis was conducted in 2017. Incidental sockeye salmon harvest in the 2017 Amalga Harbor purse seine fishery was 2,689 fish. Otolith analysis indicated that $49 \%$ were enhanced fish of DIPAC origin, and $2.5 \%$ were enhanced fish of TBR origin.

## Canadian Fisheries

The Taku River commercial fishery harvest was 246 large Chinook (greater than 660 mm MEF, mostly 3-ocean or older), 88 nonlarge Chinook, 30,209 sockeye, and 7,726 coho salmon in 2017. Sockeye salmon originating from Taku fry plants contributed an estimated 2,805 fish to the harvest, comprising $9.3 \%$ of the total commercial sockeye salmon harvest. As a result of poor preseason run forecasts and poor inseason projections, there was no directed commercial Chinook salmon fishery in 2017; any harvest that occurred was the result of incidental catch in commercial fisheries for sockeye salmon. The catch of large and non large Chinook salmon was well below the average. In addition, the Chinook salmon assessment fishery did not occur in 2017. In 2005, as a result of the new Chinook salmon agreement which allows directed Chinook salmon fishing if abundance warrants, catch accounting for nonlarge salmon was revised from a commercial weight-based designation (previously referred to "jacks" which were typically fish under 2.5 kg or 5 kg , depending on where they were being marketed), to a length-based designation ("nonlarge" Chinook salmon i.e. less than 660 mm in length MEF). Hence, comparisons with catches prior to 2005 should be viewed accordingly. The catch of sockeye salmon was above average and the coho salmon catch was slightly below average. There were 37 days of fishing which was below average. The seasonal fishing effort of 360 boat-days was also below average. As is typical, both set and drift gillnets were used, with the majority of the catch taken in drift gillnets. The maximum allowable mesh size was 20.4 cm ( 8.0 inches)
except for the period of June 27 to July 18, at which time it was reduced to 14.0 cm ( 5.5 inches) to minimize the incidental catch of Chinook salmon.

In addition to the commercial fishery harvest, 31 nonlarge Chinook, 4 large Chinook, 229 sockeye, and 76 coho salmon were harvested in the Aboriginal fishery. All 37 Chinook salmon were harvested from the Nakina River. On average (from 2007 to 2016), 115 large Chinook, 143 sockeye and 135 coho salmon are harvested annually in the Aboriginal fishery.

Complete recreational harvest data are not available, but it is estimated that no large Chinook salmon were retained in this fishery. As a result of the preseason forecast being below the goal range, retention of Chinook over 65 cm was not permitted effective April 1,2017 . The catches of other salmon species are thought to have been negligible.

The bilateral preseason forecast for the Taku River Chinook salmon terminal run was 13,300 large fish, well below average run size of 31,607 fish. The forecast generated by the Taku River Chinook salmon model produced a terminal run size estimate of 18,100 fish. However, due to consistent overestimation in recent years, this preseason forecast was reduced by $36 \%$ reflecting forecast performance for the past 5 -years. An additional consideration for reducing the model produced forecast was the general poor performance of Chinook salmon stocks in recent years throughout northern British Columbia and Alaska.

At a run size of this magnitude, factoring in the revised interim MSY escapement point target of 25,500 fish, there was no AC for either the U.S. or Canada based on the preseason forecast and therefore, a directed Chinook salmon fishery was not prosecuted.

Table 6. Weekly large Chinook salmon guideline harvest for the Canadian assessment fishery in the Taku River for 2017.

| SW | Start Date | Assessment Harvest | Directed Harvest | Preseason <br> Guideline |

| 24 | 11-Jun | - | - | - |
| 25 | 18-Jun | - | - | - |
| Total |  | 0 | 0 | 0 |

Typically, the inseason management of Taku River Chinook salmon depends on abundance estimates generated from the joint MR program in the lower Taku River with tags being applied below the border and recoveries being made in the Canadian assessment and/or commercial fisheries. In recent years, when the preseason forecast or inseason projections have indicated no AC, the commercial fishery has operated in an assessment mode and served as the test fishery identified in the PST agreement. In 2017, projections were so low
that the assessment fishery did not occur. As such, the preseason forecast was used to make necessary adjustments in the other fisheries with the intention of limiting the incidental harvest of large Chinook salmon.

Table 7. Forecasts of terminal run size, allowable catch (AC), weekly guidelines, and actual catch of Taku River large Chinook salmon, 2017.

| Target |  |  |  |  |$\quad$| Harvest |
| :---: |

*: No directed Chinook salmon fishery in 2017.
The directed sockeye salmon fishery was delayed for one week (SW 25), and opened noon on Tuesday, June 27 (SW 26). Fishing periods were set with a view to achieving weekly guideline harvests. Extensions to weekly fishing periods were considered if the weekly guidelines were not achieved. For both drift and set gillnets, net length was restricted to a maximum of $36.6 \mathrm{~m}(120 \mathrm{ft}$.); mesh sizes were restricted to between 100 mm ( 4 inches) and 204 mm (8 inches) except for the period from June 25 (SW 26) through July 22 (SW 29) when the maximum permissible was 140 mm ( 5.5 inches). Adjustments to fishery openings and gear were made to reduce the bycatch of Chinook salmon.

The preseason forecast for wild Taku sockeye salmon was based on stock recruitment and sibling analyses, and projected a run of 198,000 fish, above the average run size of 176,000 fish. Approximately 19,400 enhanced fish from Tatsamenie Lake were forecasted, above the average Tatsamenie enhanced run size of 8,600 fish. Based on the treaty arrangement, an enhanced run of $15,001-25,000$ fish provides Canada with a $23 \%$ share of the TAC, with management based on weekly estimates of the TAC of wild fish. Subtracting the escapement target of 75,000 wild sockeye salmon from the forecast of 198,000 fish resulted in an overall TAC of 123,000 fish; $23 \%$ of that was approximately 28,290 fish.

The forecast for the run of wild Tatsamenie fish was 28,000 fish, above the average of approximately 9,700 fish. The egg-take goal for the 2017 season was based on a target of $30 \%$ of the escapement up to a maximum of 2.0 million eggs. During SWs 31-33 (July 30August 19), management attention focused on Tatsamenie sockeye salmon to ensure an adequate number of sockeye salmon escaped to Tatsamenie Lake to support wild production and egg-take objectives.

As in past years, guideline harvests were developed each week for both sockeye and coho salmon fisheries to guide management decisions so that: a) the catch was consistent with conservation and Treaty goals; and b) management was responsive to changes in projections of abundance (i.e., abundance-based management).

The following summarizes the fishery management on a weekly basis and generally captures catch estimates and stock assessment information made inseason. Sockeye salmon catches in relation to run projections are for wild fish; CPUE data is for wild and enhanced fish combined. Guideline harvests presented in Table 8 are based on run projections made the previous week; additionally, those identified in the verbiage were generally based on the previous week's run projection. Weekly enhanced contributions to the overall catch are based on calculations made inseason. Guidelines identified in Table. 8 were set using a 23:77 harvest split for the entire sockeye salmon management period.

The management plan indicated that the sockeye salmon fishery would be restricted to a 48 hrs period in SW 26 (June 25-July 1) due to the poor returns observed at Kuthai Lake over the past 10 years. Additional modifications were made to address Chinook salmon management concerns. These modifications included: the voluntary release of healthy Chinook salmon captured incidentally in the sockeye salmon fishery and additional gear restrictions such that only drift nets were permitted. The weekly guideline based on the preseason forecast was 1,655 wild fish (Table 8). Weekly effort included 3.5 licenses, which was below average. The CPUE of 75 fbd was above the weekly average of 60 fbd . Water levels were below average, but spiked slightly early in the week. The fishery opened for 1 day initially; a one day extension was allowed because sockeye salmon catch rates were above average and Chinook salmon bycatch was negligible after day one. The maximum mesh size allowed in SW 26 was 140 mm ( 5.5 inches). The two day opening resulted in a weekly catch of 496 sockeye salmon and incidental catch (and retention) of 68 large Chinook salmon.

The fishery was opened for 2 days in statistical week 27 (July 2-July 8). Although fishers were permitted to use set nets in SW 27, the voluntary release of healthy Chinook salmon was encouraged. The weekly guideline harvest for the week, based on the preseason forecast, was $\sim 2,100$ sockeye salmon. Five licenses fished during this opening and CPUE was 44 fbd , below the weekly average of 58 fbd . As a result of the lower than average CPUE, no extensions occurred. Water levels remained below average for the fishing period. Weekly catch totals were 410 wild sockeye salmon. In addition, 25 enhanced sockeye salmon (King Salmon Lake origin) and 57 large Chinook salmon were harvested.

Table 8. Canadian inseason forecasts of terminal run size, total allowable catch (TAC), and spawning escapement of wild Taku River sockeye salmon, 2017.

|  | Terminal |  | Projected | Canadian | Weekly | Surplus | Actual |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SW | Run | TAC | Escapement | AC | Guideline | AC* | Catch |
| 26 | 198,000 | 123,000 | 75,000 | 28,290 | 1,655 | 0 | 496 |
| 27 | 198,000 | 123,000 | 75,000 | 28,290 | 2,115 | 0 | 410 |
| 28 | 198,000 | 123,000 | 75,000 | 28,290 | 2,780 | 0 | 1,081 |

| 31 | 136,640 | 61,640 | 89,249 | 14,177 | 2,322 | 0 | 4,923 |
| 32 | 140,854 | 65,854 | 79,666 | 15,146 | 1,557 | 0 | 2,806 |
| 33 | 138,182 | 63,182 | 76,578 | 14,532 | 740 | 0 | 2,958 |

Note: Terminal run assessments and weekly guidelines based on previous week's run size projections. *Surplus AC was calculated using the final estimate for each SW.

In statistical week 28 (July 9-15), the fishery was initially opened for two days. As a result of high water conditions (Tulsequah River flooding) and poor fishing conditions, the opening was extended for two additional 24 hr periods. Based on the preseason forecast, the weekly guideline was set at $\sim 2,800$ sockeye salmon. The weekly catch was 1,081 wild sockeye salmon (plus 60 enhanced sockeye salmon of which 36 were of either King Salmon or Tatsamenie origin and 24 were of Stikine origin) bringing the cumulative total to 1,987 fish; above the cumulative weekly guideline harvest of $\sim 1,800$ fish. A total of 52 large Chinook salmon was also caught. Weekly licenses fishing averaged 4.8. Water levels spiked through the latter part of SW 28 and into SW 29, exceeding long term averages. This peak was the result of high water in the Tulsequah River leading to poor fishing success. The weekly sockeye salmon CPUE was 60 fbd and was below the average for SW 28 of 65 fbd . The run projection made after the close of the fishery in SW 28 was 98,693 fish; this projection was approximately 100,000 fish lower than the preseason run projection.

Using the previous week's projection, the weekly guideline for SW 29 (July 16-22) was 612 sockeye salmon. An opening of two days was initially posted, and a 1day extension was added to mitigate for poor fishing conditions and high water (rainfall) midweek. The opening was characterized by rising water levels which peaked midweek and were well above average. The CPUE for SW 29 ( 58 fbd ) was below average ( 85 fbd ). The weekly catch was 767 sockeye salmon (plus 40 enhanced sockeye salmon mostly from King Salmon and Tatsamenie origin). The number of licenses fishing for the week was 4.7, which was below the average of 7.6 . A run projection of 98,396 fish, made after the end of the fishery, was similar to the estimate generated the previous week.

The fishery in statistical week 30 (July 23-29) was opened on two days. In light of strong catch rates and good wheel catches, the fishery was opened for two additional 24 hour periods. The weekly guideline was set at $\sim 800$ sockeye salmon. River levels were slightly above average to start the week but decreased to below average as the week progressed. The weekly CPUE ( 180 fbd ) was well above average ( 108 fbd ). The weekly catch was

5,013 wild and 377 enhanced fish, which were mostly of Tatsamenie origin. The cumulative sockeye salmon catch after week 30 was $\sim 7,800$ wild fish, below the cumulative guideline of $\sim 8,100$ fish. The number of licenses that fished in SW 30 was 7.5, below the average of 8.6 . After day 3 of the fishery, a run projection of 136,640 fish was made which was well above the SW 29 estimate.

For SW 31 (July 30-August 5), the weekly guideline was set at ~2,300 sockeye salmon based on run outlook from SW 30. The initial opening was two days. The fishing period was extended by 24 hrs as a result of near average catch rates, and was extended an additional day as catch rates continued to improve. Run projections made during the openings suggested an increasing run size. The weekly catch rate ( 150 fbd ) was above average ( 121 fbd ), and nine licenses fished. The weekly catch was 4,923 wild and 487 enhanced Tatsamenie fish. The river level was below average, but started to increase late in the week. The final weekly run projection was 140,854 , slightly higher than the previous week.

The fishery in statistical week 32 (August 06-12) was initially opened for two days. The weekly guideline was 1,600 fish based on the final run projection in SW 31. A one day extension was added as catch rates remained high despite increasing water levels. Despite higher than average water levels early in the week, the weekly CPUE was 129 fbd , compared to an average of 119 fbd , for 8.7 licenses. The weekly catch was 2,806 wild and 535 enhanced Tatsamenie sockeye salmon. After the third day of the opening, the weekly catch had exceeded the weekly guideline and the weekly terminal run projection of 138,182 did not suggest that the run was improving. As a result, no futher extensions occurred.

Statistical week 33 (August 13-19) started with a weekly guideline harvest of $\sim 700$ fish. Because the run projection was lower at the end of week 32 than it was at the beginning of the week, the fishery was opened only for two days. Catch rates after day one (112 fbd) were well above average ( 83 fbd ) and a one day extension was granted. River levels were near average for the fishing period. Weekly licenses fished was 9.3 . A total of 2,958 wild and 329 enhanced Tatsamenie fish were harvested.

Statistical week 33 marked the end of the directed sockeye salmon fishery. The run projection after SW 33 was 141,953 wild fish, and was lower than the preseason forecast of 198,000 fish; the cumulative weekly inseason guideline was $\sim 14,300$ fish at a $23 \%$ harvest share. The actual harvest of wild fish was 17,419 fish. The escapement projection was $\sim 87,000$ wild fish was slightly above the goal range of 71,000 to 80,000 fish.

Adding the wild sockeye salmon taken in the directed coho salmon fishery ( $\sim 9,000$ fish) brought the total commercial harvest to 27,400 wild fish. The inseason catch estimate of enhanced Taku River sockeye salmon was 2,809 fish which included 115 (approximately) fish from King Salmon Lake and 2,690 fish from Tatsamenie Lake. A small number of Stikine and U.S. domestic enhanced origin fish were also harvested.

Postseason figures for the above are presented in the Sockeye Salmon Run Reconstruction section.

The forecast for the total run of Taku River coho salmon in 2017 was 184,000 fish. This forecast was generated using the relationship between the CPUE in smolt tagging and the total run estimates seen over the past twenty years. The average total run of Taku River coho salmon is approximately 175,000 fish. Assuming average U.S. exploitation rates, this translated to an inriver run of approximately 127,000 fish. Based on the bilaterally agreed to escapement goal of 70,000 fish (range: 50,000-90,000 fish), the U.S. intent was to manage its fisheries to target a minimum above border run of approximately 75,000 coho salmon. A directed Canadian harvest of 5,000 fish would be permitted starting in SW 34 for assessment purposes. Canada was also permitted to harvest all coho salmon in excess of 70,000 fish plus the fish allocated for assessment purposes.

Statistical week 34 (August 20-26) was open for two days based on inriver projections. The weekly guideline harvest was set at 400 coho salmon. Near average coho catch rates and strong sockeye salmon catches after day one resulted in a 24 hrs extension. Catch rates for the week ( 44 fbd ) were slightly below average ( 52 fbd ) but sockeye salmon catches ( 86 fbd ) remained high for this time of year compared to average ( 47 fbd ). Fishing conditions were favourable with decreasing water levels and the number of licenses was above average ( 10 licenses compared to the SW 34 average of $\sim 8$ ). A total of 1,305 coho salmon were landed plus $\sim 2,400$ sockeye salmon (including 181 enhanced Tatsamenie fish). The MR estimate after day 3 indicated that 23,077 fish had crossed the border; this projected to an inriver run of 74,936 fish. The projection was well below the preseason forecast but still provided Canada with harvest opportunity.

Statistical week 35 (August 27-September 2) was opened for two days based on the inriver projection of $\sim 75,000$ fish. In light of the inriver run projection from SW 34, the decision was made to into an assessment mode for coho salmon. The opening was extended for two additional 24 hrs periods to meet the coho salmon target of $\sim 1,500$ fish. Coho salmon catch rates for the week were average ( 65 fbd compared to average of 65 fbd ), but sockeye salmon CPUE was the highest on record for the week (176 fbd). A coho salmon run projection made after day 4 ( 68,805 fish) was lower than the SW 34 projection ( $\sim 75,000$ fish). Water levels were near average, and $\sim 7$ licenses fished for the week. A total of 1,749 coho salmon and 4,200 sockeye salmon were caught (including 518 enhanced Tatsamenie fish).

Statistical week 36 (September 3-9) was opened on two days based on the SW 35 projection of $\sim 69,000$ fish, and a coho salmon assessment target of $\sim 1,000$ fish. Coho salmon catch rates for the week were below average ( 43 fbd compared to an average of 78 fbd), and sockeye salmon continued with good catch rates for the time of the year ( 73 fbd compared to an average of 23 fbd ). A coho salmon run projection made after day 2 ( 65,443 fish) was slightly below the previous week's estimate (68,805 fish). Water levels peaked early in the statistical week and were well above average; however by the end of the week, water levels had dropped to average. Nine licenses fished for the week which was above the average of between 4 and 5 licenses. A total of 771 coho salmon and $\sim 1,200$ wild sockeye salmon were caught (plus 119 enhanced Tatsamenie fish).

Statistical week 37 (September 10-16) was opened for two days based on the SW 36 projection of $\sim 65,000$ fish, and the coho assessment target of $\sim 1,000$ fish. The opening was extended for two days with the intention of completing the assessment component of the commercial effort ( 5,000 fish). Water levels were high during this SW compared to other weeks in the directed coho salmon period, but were near average. Coho salmon catch rates were above average ( 70 fbd versus 47 fbd ), and sockeye salmon catches remained high and well above the average for this time of year ( 84 fbd compared to an average of 8 fbd). The number of licenses was above average for this time of year ( 5 compared to an average of $\sim 3$ ). A coho salmon run projection made after day 4 ( 62,973 fish) was similar to the SW 36 estimate ( $\sim 65,000$ fish). A total of 1,054 coho salmon and 1,264 sockeye salmon were caught (including 114 enhanced Tatsamenie fish).

From SW 38 to 41 (September 17-October 14), no additional commercial fishery openings were provided.

## Escapement

## Sockeye Salmon

Spawning escapement of sockeye salmon into the Canadian portion of the Taku River drainage is estimated from the joint Canada/U.S. MR program. Counting weirs operated by DFO at Little Trapper and Tatsamenie lakes and by the TRTFN at Kuthai and King Salmon lakes provide some information on the distribution and abundance of discrete spawning stocks within the watershed.

The sockeye salmon MR program has been operated annually since 1984 to estimate the above border run size. Spawning escapement is then estimated by subtracting the inriver harvest from the above border estimate. The postseason estimate of the above border run in 2017 is 138,518 fish; subtracting the inriver harvest of 30,379 Taku fish (30,150 commercial and 229 Aboriginal) indicates that 108,416 sockeye salmon reached the spawning grounds. The Taku River wild spawning escapement was slightly above average, and above the interim escapement goal range of 71,000 to 80,000 wild sockeye salmon. The Canyon Island catch in fish wheels one and two of 4,771 sockeye salmon was average. The third fish wheel added in 2016 caught an additional 1,085 sockeye salmon.

The sockeye salmon count through the Kuthai Lake weir was 299 fish. An aerial survey did not take place in 2017. The 2017 count was well below the average of 898 fish and $65 \%$ above the primary brood year (2012) escapement estimate of 181 fish.

The King Salmon Lake weir count of 439 fish was below the average of 2,187 fish and 8\% of the primary brood year (2012) escapement estimate of 5,413 fish.

The Little Trapper Lake weir count was 6,552 sockeye salmon was average and $64 \%$ of the 2012 primary brood year count of 10,015 fish. The run timing appeared a bit late, but the peak was average occurring on August 7. There were 176 removals for artificial spawning.

The Tatsamenie Lake weir count of 27,237 sockeye salmon was a record year well above the average of 9,592 fish and the 2012 primary brood year count of 15,605 fish. The run was about one week late with the midpoint occurring approximately September 5. Based on thermal mark data 4,686 fish or $17 \%$ of the weir count were enhanced fish. There were a total of 1,540 removals which included: 1,014 fish for broodstock, 22 fish mortalities, and 504 fish held and released unspawned.

## Chinook Salmon

Spawning escapement of Chinook salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. MR program. Tag application took place from April 28 through August 6 using fish wheels and drift gillnets to capture fish. The fish wheels were located at Canyon Island and drift gillnets were used in the lower river from the Wright River just downstream of the U.S./Canada border. Catches in the drift gillnet accounted for $77 \%$ of the large tags applied. Tag recovery effort consisted of samples from the sockeye and coho salmon commercial fisheries (SWs 26-37). Spawning ground sampling occurred in July through September on the Nakina, Tatsatua, Kowatua, Nahlin, and Dudidontu rivers, as well as on Tseta Creek. In addition, a sonar weir was operated from June 1-July 26 on the lower Nahlin River to enumerate large Chinook salmon passing upriver. An insufficient number of large Chinook salmon spaghetti tags were recovered in the lower river commercial fishery or combined spawning grounds sample to generate a mark-recapture abundance estimate for large Chinook salmon. The marked fraction between the lower river commercial sample and combined spawning grounds sample were significantly different which precluded combining the two samples to generate an abundance estimate. Chinook salmon escapement estimate of 8,754 large fish was generated using radio tags applied in the drift gillnet as the tagging event (event 1), and combining Nahlin sonar count and combined spawning ground samples for the recapture event (event 2). Only radio tags that were classified as reaching known spawning locations were included in the tagging event.

Aerial surveys of large Chinook salmon to the five escapement index areas were as follows: Nakina 301 fish; Kowatua 272 fish; Tatsamenie 179 fish; Dudidontu 37 fish; and Nahlin 134 fish; all sites were below average. Viewing conditions were good to excellent for all surveys and the total peak count of 923 large Chinook salmon which expands to 4,800 large fish using an expansion factor of 5.2. The count of 923 large Chinook salmon was the lowest observed since standardized surveys began in the early 1970s.

The carcass weir on the Tatsatua River operated to obtain tag and age, sex, and length data. A total of 235 large Chinook salmon were encountered, either on the weir or through supplemental angling, and this was average. Comparisons between years should be made cautiously as water levels, effort and fish distribution can have a significant effect on the numbers of fish observed.

## Coho Salmon

Spawning escapement of coho salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. MR program. Tag application occurred from June 30
(SW 26) until September 30 (SW 39) and recovery occurred until October 4 (SW 40). The tag recovery effort consisted of the commercial fishery followed by an eighteen day test fishery which commenced September 17 (SW 38). In 2017, the test fishery was a live release program operated by DFO cooperatively with the TRTFN that caught and released 686 coho salmon. The postseason inriver MR estimate is 65,670 fish. Taking into account the inriver harvest of 7,802 fish ( 7,726 commercial and 76 Aboriginal) the spawning escapement estimate was 57,868 fish. This was below the average escapement $(88,207$ fish) and within the 2017 biological escapement goal range of 50,000-90,000 fish.

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels were used as an index of escapement. A total of 32,027 pink salmon were captured in the three operational fish wheels in 2017. Fish wheel three has only been in operation for 2 years, so for long term comparison, we can only use data from fish wheels one and two. They captured 18,520 pink salmon in 2017, above the odd year average.

## Chum Salmon

Chum salmon escapement numbers to the Taku River are unknown; however, the numbers of fall chum captured by the fish wheels at Canyon Island were used as an index of escapement. A total of 257 chum salmon were captured in the three operational fish wheels in 2017. Fish wheel three has only been in operation for 2 years, so for long term comparison, we can only use data from fish wheels one and two. They captured 236 pink salmon in 2017, near the average.

## Sockeye Salmon Run Reconstruction

An estimated 67,706 wild and 6,042 enhanced Taku sockeye salmon were harvested in the traditional U.S. District 111 drift gillnet fishery. This estimate was made by postseason GSI and otolith analysis. An additional 775 wild and 81 sockeye salmon were estimated to have been taken in the U.S. inriver personal use fishery. The estimated total U.S. harvest of Taku sockeye salmon is 68,480 wild and 6,123 enhanced fish (Table 4).

In the Canadian commercial fishery, the postseason harvest estimate of Taku sockeye salmon is 27,345 wild, 2,690 enhanced Tatsamenie Lake, and 115 enhanced King Salmon Lake fish. Also, harvested was 59 from the Stikine, and 0 fish from U.S. domestic stocks; total Canadian commercial harvest was 30,209 (30,150 Taku fish and 59 non-Taku enhanced fish). An estimated 207 wild and 22 enhanced sockeye salmon were taken in the Canadian Aboriginal fishery. Therefore, the estimated Canadian treaty harvest of Taku sockeye salmon is 27,552 wild and 2,827 enhanced fish (Table 4). The coho test fishery did not harvest any sockeye salmon.

The postseason estimate of the above border run size of sockeye salmon, based on the joint Canada/U.S. MR program, is 138,796 fish. Deducting the Canadian inriver harvest noted above from the above border run estimate results in an estimated escapement of 108,416
sockeye salmon; 103,302 wild fish. The escapement of Taku River sockeye salmon originating from the fry planting program was estimated to be 4,686 fish from brood stock otoliths collected at Tatsamenie Lake. The terminal run of Taku River sockeye salmon is estimated at 213,399 fish; 199,235 wild and 14,146 enhanced fish. Based on the escapement goal of 75,000 wild fish, the wild TAC was 124,789 fish and combining wild and enhanced terminal run the TAC was 138,399 sockeye salmon. The harvest sharing agreement based on total terminal enhanced run was $79 \%$ U.S. and 21\% Canada.

#### Abstract

ALSEK RIVER Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 3). Unknown quantities of Alsek River origin fish may also be taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although Aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 3).

## Harvest Regulations \& Management Objectives

Although harvest sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV does call for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook and sockeye salmon. In February 2013, the bilateral TTC and bilateral TBR Panel agreed to the revised biological escapement goals for Alsek River Chinook and sockeye salmon. These were Alsek River Chinook salmon MSY target of 4,700 fish (escapement goal range 3,500-5,300 fish), Klukshu River Chinook salmon MSY target of 1,000 fish (escapement goal range of 800-1,200 fish), Alsek River sockeye salmon MSY target of 29,700 fish (escapement goal range of 24,000-33,500 fish), and Klukshu River sockeye salmon MSY target of 9,700 fish (escapement goal range 7,500-11,000 fish). The principle escapementmonitoring tool for Chinook and sockeye salmon stocks on the Alsek River is the Klukshu weir, operated by the DFO in cooperation with the Champagne-Aishihik First Nation (CAFN). The weir has been in operation since 1976. To make the management objectives of Chinook and sockeye salmon better defined in terms of Klukshu stocks, the revised goals expressed in terms of Klukshu escapements, were used in 2016. Mark-recapture programs to estimate the total inriver abundance and the fraction of the escapement contributed by the Klukshu stocks were in operation since 1997 for Chinook salmon and since 2000 for sockeye salmon. These were discontinued in 2005. Currently, total Alsek River run estimates for sockeye salmon are generated using Dry Bay commercial sample GSI analysis to expand the Klukshu River weir counts.

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas.

## Preseason Forecasts

The Klukshu River Chinook salmon escapements in 2011 and 2012 were 1,610 and 693 fish, respectively. For comparison, the average escapement is approximately 1,132 Chinook salmon. Based on the primary brood year escapements, the production outlook for 2017 was 1,400 (reduced by $38 \%$ to account for forecast error) Klukshu River Chinook salmon, below the average of approximately 1,500 fish and above the revised escapement goal range.

The 2017 Alsek River sockeye salmon run was expected to be approximately 74,000 fish; this was above the average run size estimate of approximately 68,000 sockeye salmon. The
outlook for 2017 was based on a predicted run of 17,000 Klukshu River sockeye salmon derived from the latest Klukshu River stock-recruitment data (2011 Eggers et al.) and an assumed Klukshu River contribution to the total run of $23 \%$, which was based on MR results (2000-2004) and run size estimates using GSI (2005-2006, 2011). Principal contributing brood years were 2012 (Klukshu River escapement of 17,176 sockeye salmon) and 2013 (Klukshu River escapement of 3,792 sockeye salmon); the average Klukshu River sockeye salmon escapement forecast was approximately 15,600 . Based on the current stock-recruitment analysis, the range of Klukshu River escapements that appears most likely to produce optimum yields is 7,500 to 11,000 sockeye salmon.

The Klukshu River early sockeye salmon run counts in 2012 and 2013 were 5,969 and 312 fish, respectively. The average count was approximately 2,800 sockeye salmon which is above the minimum management target of 1,500 fish used by DFO. The early run to the weir was expected to be above this level in 2017.

The coho salmon partial escapement estimates at the Klukshu River weir in 2013 (7,322 fish) and 2014 ( 341 fish) suggested the run in 2017 would be above average. The recent average weir count was approximately 2,200 coho salmon.

## U.S. Fisheries

Preseason expectations were for below average Chinook salmon runs and above average sockeye salmon runs. These projections were based on parent-year escapements to the Klukshu River. In 2017, the Alsek River recorded a below average run for sockeye salmon and the lower bound of Klukshu River escapement goal range was not attained. Chinook salmon runs were also below average in 2017, and the escapement goal as measured at the Klukshu River was also not achieved.

In 2017 management decisions were made by monitoring fishery performance data and comparing it to historical CPUE for a given opening to adjust time and area openings. The Alsek River commercial fishery opened on June 4 for one day. Chinook and sockeye salmon harvests were both below average. Eleven permits harvested 45 Chinook and 269 sockeye salmon during the first opening. Peak sockeye salmon harvest occurred during SW 26 with 10 permits harvesting 927 fish. Effort started to decline by SW 30 and by SW 34 coho salmon management strategies were in place. Coho salmon are targeted starting in mid-August and effort becomes minimal. Fishing times remained at three days per week in SW 35. As fishing effort continued to drop, fishing times increased to five days per week during SW 36 and 37 . By SW 38 there was no fishing effort. The river was not fished the last six weeks of the season. The commercial fishing season closed on October 19.

The 2017 Dry Bay commercial set gillnet fishery harvested 127 Chinook, 4,883 sockeye, and 114 coho salmon (Table 9). There was no chum or pink salmon harvested. A test fishery for Chinook salmon was conducted in the Alaska portion of the Alsek River in 2005-2008 and from 2011-2012. Test fishing ceased in 2014.

## Canadian Fisheries

Due to the absence of a harvest monitor position in 2017, catches from the food fishery were estimated based on fishery performance data compared with the weir counts. The harvest estimate for 2017 was comprised of the fish taken from the Klukshu River weir (elders only) and an estimate of catches above/below the weir (based on the past relationship with the weir count and harvest). An estimated 10 Chinook, 584 sockeye, and no coho salmon were harvested in the food fishery. The recent average harvests are 30 Chinook, 1,108 sockeye, and 4 coho salmon.

Harvest estimates for the Tatshenshini River recreational fishery were an estimated 41 Chinook salmon retained and 109 fish released, and 38 sockeye salmon were retained and 38 fish released. There were no recorded coho salmon caught although this is considered incomplete as fishing may have taken place after monitoring had ceased. These catches were above average for Chinook and sockeye salmon.

Management of salmon in Yukon is a shared responsibility between DFO and the Yukon Salmon Sub-Committee (YSSC). The YSSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the YSSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

Table 9. Klukshu River harvest and escapement for the Chinook and sockeye salmon and Alsek River harvest for Chinook and sockeye salmon for 2017.

|  | Chinook | Sockeye |
| :--- | ---: | ---: |
| Klukshu River $^{\text {a }}$ |  |  |
| Weir count | 448 | 3,889 |
| Harvest at/above weir | 5 | 178 |
| Escapement | 443 | 3,711 |
|  |  |  |
| Harvest $^{\text {b }}$ |  |  |
| U.S. Commercial | 127 | 4,883 |
| U.S. Subsistence/P.U. | 4 | 31 |
| U.S. Test | 10 | 584 |

Alsek River
Above border run 102,186
Total inriver run
<Above border run above + U.S. harvest>

Total escapement
<Above border run above - U.S. harvest>
a Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
b U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for harvest other than the listed fisheries.

The 2017 Alsek-Tatshenshini management plan, adopted by CAFN, YSSC, and DFO, was based on the escapement objectives described in the Harvest Regulations \& Management Objectives section above. For Chinook and early run sockeye salmon management, the status of the Klukshu weir counts was reviewed about July 18 to ensure weir and spawning escapement targets were on track. Run projections for Chinook salmon were below the lower bounds of the escapement goal so the recreational fishery was switched to nonretention period for Chinook salmon on July 28. On August 15 sockeye salmon changed from nonretention to a retention period of two fish per day four fish in possession. The status of the late run sockeye salmon was also reviewed late August and switched back to nonretention period on Sep 1 due to the sockeye salmon run projections being below the minimum escapement goal. The Aboriginal fishery remained unrestricted. Other key elements of the plan are described below.

The center of Aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines Road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff, small gillnets, sport rods, and traditional fish traps as the fish migrate up the Klukshu River and into Klukshu Lake. The fishing plan for the Aboriginal fishery in the Klukshu River and adjacent areas allowed for fishing by any means (as established in the communal license) 7 days a week. Conservation thresholds that might
invoke restrictions in the Aboriginal fishery were projected Klukshu weir counts of < 800 Chinook, < 1,500 early, and < 7,500 total sockeye salmon. Food fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The plan did not restrict the fishery other than to reserve harvests of Chinook salmon at Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the recreational fishing effort on the Alsek drainage occurs in the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 unless the weir count projection for the early run was $>4,500$ sockeye salmon. The Chinook salmon daily catch limit was one per day, two in possession. For other salmon species, the daily catch and possession limits were two and four fish, respectively. However, the aggregate limit for all salmon combined was two salmon per day, four fish in possession. Recreational salmon fishing was permitted in the Tatshenshini River seven days a week. Headwater areas in the vicinity of the British Columbia/Yukon border were to be closed in late July to protect spawning Chinook salmon. Conservation thresholds that were expected to invoke additional restrictions in the recreational fishery were projected Klukshu weir counts of < 1,000 Chinook and < 10,500 sockeye salmon (early and late runs combined).

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the YSSC in 1999, was required by all recreational salmon fishers in 2017. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon recreational fishery. Anglers are required to report their catch via email or mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River bridge crossing upstream to the weir location to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini confluence.

## Escapement

Total drainage abundance programs are being investigated as part of the development of abundance-based management regimes and to accurately assess whether the escapement goals for Alsek River Chinook and sockeye salmon stocks are appropriate and if so, are being achieved. At this time, there are no programs in place to estimate the drainage-wide coho salmon escapement. A large and variable proportion of the drainage-wide escapement of each species is enumerated at the weir on the Klukshu River. Current escapement monitoring programs including the Klukshu and Village Creek weirs, GSI based run reconstruction, expanded counts, and aerial surveys which allow annual comparisons of escapement indices. The most reliable long-term comparative escapement index for Alsek River drainage salmon stocks is the Klukshu River weir count. Escapements for 2017 are shown in Table 9. A video enumeration system has been operated on the Klukshu River
since 2016 (following the operation of a similar system on Village Creek since 2014), which facilitated salmon passage 24 hours per day.

## Sockeye Salmon

In 2017, the Klukshu River sockeye salmon weir count was 3,889 fish and the escapement estimate was 3,711 fish (Table 9). The count of 1,087 early run fish (count through August 15) was below the average of 2,775 fish as was the count of 2,802 late run fish with an average of 8,319 fish. The total escapement of 3,711 fish was below the recommended escapement goal range of 7,500 to 11,000 fish. The sockeye salmon count at Village Creek was 240 fish; this was well below average. In spring 2017 Village Creek had a mudslide occur 800 m upstream of the video counter that significantly reduced water clarity for the entire length of the project and impacted the ability of the video counter to capture passing fish. As a result, the 2017 count is considered incomplete.

## Chinook Salmon

The most reliable Chinook salmon escapement index for the Alsek River drainage is the Klukshu River weir count. In 2017, the Chinook salmon weir count was 448 fish and the escapement estimate was 443 fish (Table 9). The 2017 escapement estimate was below the escapement goal range of 800 to 1,200 Klukshu Chinook salmon.

## Coho Salmon

The Klukshu River coho salmon count prior to weir removal was 966 fish. As in past years, this does not serve as a reliable run strength indicator as the weir is removed well before the end of the coho salmon run to the Klukshu River. This number is below average compared to past years.

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2017, sockeye salmon eggs were collected at Tahltan Lake on the Stikine River for the twenty-ninth year, Tatsamenie Lake system on the Taku River for the twenty-eighth year of this program and Lower Trapper Lake on the Taku River for the ninth year.

## Tahltan Lake

In 2017, Tahltan Fisheries were contracted to perform the egg take. The egg-take goal was set at 5.0 million eggs in the approved Stikine River Enhancement Plan. Canadian technical staff lowered the egg-take goal to 3.5 million eggs due to low escapement and treaty stocking guidelines not to exceed a $1: 1$ ratio of enhanced to wild smolt out-migrating from the lake. A total of 1,364 females and 1,315 males were spawned over the course of 9 eggtake days conducted from September $1^{\text {st }}$ to $21^{\text {st }}$. This produced an estimate of 3.7 million sockeye salmon eggs for delivery to Snettisham Hatchery in Alaska (based on an estimated
fecundity of 2,730 eggs per female). Three of the 9 lots of eggs being transported to the hatchery were delayed by one day due to weather. The egg survival at Snettisham Hatchery to 100 CTU was $78 \%$. The egg pick at Snettisham Hatchery determined the actual number of eggs collected to be 3.85 million.

## Tatsamenie Lake

In 2017, B. Mercer and Associates Ltd was contracted to collect eggs at Tatsamenie Lake. Broodstock was captured for the twenty-third year near the assessment weir at the outlet of Tatsamenie Lake and held until ripe. Escapement through the weir was 27,290 fish. The egg-take goal was set at 2.0 million eggs in the approved Taku Enhancement Production Plan. A total of 507 females were spawned over the course of 4 egg-take days conducted from September $12^{\text {th }}$ to $30^{\text {th }}$. There were no delays due to weather. An estimated 2.0 million sockeye salmon eggs were delivered to Snettisham Hatchery. Average egg survival to 100 CTU was $84 \%$.

## Little Trapper Lake

In 2017, Metla Environmental Ltd was contracted to collect a small number of eggs (1 incubator) at Little Trapper Lake. The resulting fry will be used to evaluate passage of subsequently returning adults at the barrier location between Little Trapper and Trapper Lake that is to be modified as part of the development of an enhancement program. The egg-take goal was 250,000 eggs and 280,000 eggs were delivered to Snettisham Hatchery. The eggs have been picked and have a $75 \%$ green egg to eye survival.

## King Salmon Lake

Taku River Tlingit Fisheries conducted a project to test the feasibility of using King Salmon Lake to produce sockeye salmon. In 2012 and 2014, sockeye salmon eggs were collected in King Salmon Lake, sent to Snettisham Hatchery for incubation and the resulting fry were back planted into the lake. In 2016, the four-year-old component of the brood year 2012 fry returned to the lake. Escapement into the lake was 6,404 sockeye salmon, which is significantly higher than average of 1,947 fish. In 2017, the smaller fiveyear old component of the brood year 2012 fry release returned to the lake. Escapement into the lake was 439 sockeye salmon. In 2016 and 2017 evaluations of enhanced production rely solely on fishery evaluation information of otolith recoveries.

## Incubation, Thermal Marking, and Fry Plants

Snettisham Hatchery is operated by DIPAC, a private aquaculture organization in Juneau. A cooperative agreement between ADF\&G and DIPAC provides for Snettisham Hatchery to serve the needs of the joint TBR enhancement projects.

Egg incubation and thermal-marking at Snettisham Hatchery went smoothly in 2016/2017. In 2017, brood year 2016 fry were transported to the appropriate systems from May $23^{\text {rd }}$ to June $20^{\text {th }}$. There were minimal IHNV losses of the 2016 brood year. An estimated 174,000
thermally marked Tahltan Lake stock fry from a single incubator were confirmed positive with IHNV and destroyed.

## Tahltan Lake

In 2017, a total of 3.1 million sockeye salmon fry were stocked back into Tahltan Lake. These fish were from eggs collected in Tahltan Lake in the fall of 2016. Survival from green-egg to stocking fry was 59\%. Fry stocking took place on May 23, 24, 25 and 28.

## Tuya Lake

Fry planting into Tuya Lake has been discontinued since 2014 due to Canadian domestic concerns.

## Tatsamenie Lake

In 2017, a total of 1.2 million sockeye salmon fry were stocked in Tatsamenie Lake. These fish were from eggs collected at Tatsamenie Lake in the fall of 2016. Survival from greenegg to stocked fry was $68 \%$. Approximately 1.02 million sockeye salmon fry were released directly into the lake on May $28^{\text {th }}$ and $29^{\text {th }}$. On June $9^{\text {th }}$, a flood event caused significant changes to the creek channel which prevented its use as a reliable water supply for the onshore rearing project. Enhancement Subcommittee representatives were consulted on options and determined the lake net pen rearing approach was the only option available to rear the uniquely marked fry and would be conducted as a trial. On June $19^{\text {th }}$ and $20^{\text {th }}$, approximately 183,000 sockeye salmon fry were flown to the lake and placed in four net pens. On July 28, pens \#1-3 were released at 3.8 grams. Pen \#4 was diagnosed with IHNV August 1 and all 38,000 fry were destroyed August 2. Full evaluation of the success of extended rearing will not be available until these fish return as adults.

## Sockeye Supplementation Evaluation Surveys

## Acoustic, Trawl, Beach Seine and Limnological Sampling

Standard limnological surveys were conducted at Tatsamenie and Tahltan lakes. No surveys were conducted on Tuya or Trapper lakes. No hydroacoustic surveys were conducted in 2017.

## Thermal Mark Laboratories

## ADF\&G Thermal Mark Laboratory

During the 2017 season, the ADF\&G Thermal Mark Lab processed 19,604 sockeye salmon otoliths collected by ADF\&G and DFO staff as part of the U.S./Canada fry-stocking evaluation program. These collections came from commercial and test fisheries in both U.S. and Canadian waters on the Taku and Stikine rivers over a 13 -week period. The laboratory provided estimates on hatchery contributions for 92 distinct sample collections. Estimates of the percentage of hatchery fish contributed to commercial fishery catches
were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.

Estimates of stocked sockeye salmon to Alaskan harvests were 7,101 Stikine River fish to District 106 and 108, and 6,123 stocked Taku River sockeye salmon to District 111. Estimates of stocked sockeye salmon to Canadian fisheries included 16,999 fish to Stikine River fisheries and 2,827 fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Subsamples of juvenile and adult otolith samples collected at the study lakes during the 2017 season are being analyzed at the DFO thermal mark lab in Whitehorse.

## APPENDICES

## Standards

All 2017 are considered final
Large Chinook salmon are MEF length $\geq 660 \mathrm{~mm}$
Unless otherwise stated Chinook salmon are large
Test fisheries for Chinook salmon became commercial assessment/test fisheries starting in 2004
Data not available to estimate harvests of Alaska Hatchery pink and chum salmon
All harvest of Tahltan and Tatsamenie lake sockeye salmon, unless otherwise noted, include both wild and hatchery fish.
Bold numbers are incomplete or interpolated numbers
Italicized numbers are used when the GSI estimates do not meet acceptable levels of precision and accuracy agreed upon by the TTC (April 2013): to estimate the proportion of mixtures within $10 \%$ of the true mixture $90 \%$ of the time.

Appendix B. 4. Annual estimates of Stikine River large Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2005-2017.
GSI used for sport and gillnet. Troll is based on GSI 2005-2008 and CWT 2009-present. For detailed GSI stock comp estimates see Appendix G. 5.

Appendix B. 19. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2017.
In 1979-1988, there were US estimates and 1983-1988, they overlapped with estimates from Canada
and the All tahltan estimate was oftened averaged. The estimates are from the LRCF, test, or average of LRCF and Tes
