## LIST OF TABLES

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and MR estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, troll, and subsistence fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2020................................. 21
Table 2. Weekly forecasts of run size, total allowable harvest for Stikine River sockeye salmon, and cumulative Stikine River harvest as estimated inseason by the Stikine Management Model and other methods, 2020.23
Table 3. Stikine River sockeye salmon terminal run reconstruction and harvest shares for, 2020. ..... 24
Table 4. Taku River large Chinook salmon run size based on CPUE (methods similar to the Stikine Chinook Management Model), and other methods, and weekly inseason harvest estimates from the District 111 drift gillnet, sport, troll, and personal use fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2020.
Table 5. Weekly inseason projections of Taku River wild sockeye salmon terminal run size, total allowable harvest, and cumulative harvest for 2020.38
Table 6. Taku River sockeye salmon terminal run reconstruction and harvest shares,
2020. ..... 38
Table 7. Weekly inseason projections of terminal run size, allowable harvest, and cumulative harvest by country of Taku River coho salmon for 2020. ..... 40
Table 8. Taku River coho salmon terminal run reconstruction and harvest shares, 2020.41
Table 9. Inseason run size projections, Canadian available harvest, and actual harvest ofTaku River wild sockeye salmon, 2020.51Table 10. Klukshu River harvest and escapement for the Chinook and sockeye salmonand Alsek River harvest for Chinook and sockeye salmon for 2020.61
LIST OF FIGURES
Figure 1. The Stikine River and principal U.S. and Canadian fishing areas. ..... 19
Figure 2. The Taku River and principal U.S. and Canadian fishing areas ..... 35
Figure 3. The Alsek River and principal U.S. and Canadian fishing areas. ..... 58

## LIST OF APPENDICES

Appendix A. 1. Weekly harvest estimates of Chinook salmon in the US gillnet, troll, recreational, and subsistence fisheries in District 108, 2020. ..... 68
Appendix A. 2. Weekly harvest of Chinook salmon in the Canadian commercial, Telegraph Aboriginal, and recreational fishery in the Stikine River, 2020. ..... 68
Appendix A. 3. Weekly harvest of Chinook salmon in the Canadian test fisheries in the Stikine River, 2020. ..... 68
Appendix A. 4. Weekly harvest of sockeye salmon in the Alaskan District 106 and 108 fisheries, 2020 ..... 68
Appendix A. 5. Weekly stock proportions of sockeye salmon harvested in the Alaskan D106 commercial drift gillnet fishery, 2020 ..... 69
Appendix A. 6. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2020. ..... 70
Appendix A. 7. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2020 ..... 71
Appendix A. 8. Weekly stock proportions sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2020. ..... 72
Appendix A. 9. Weekly sockeye salmon harvest and effort in the Canadian commercial and assessment fisheries in the lower Stikine River, 2020. ..... 72
Appendix A. 10. Weekly sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery in the lower Stikine River, 2020. ..... 73
Appendix A. 11. Harvest by stock and week for sockeye salmon in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2020, ..... 74
Appendix A. 12. Weekly harvest, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye salmon stocks in the Stikine River test fishery, 2020 ..... 75
Appendix A. 13. Weekly coho salmon harvest in the Alaskan District 106 and 108 fisheries, 2020. ..... 75
Appendix A. 14. Weekly harvest of coho salmon in the Canadian lower river commercial fishery and test fisheries 2020 ..... 76
Appendix A. 15. Weekly salmon effort in the Alaskan District 106 and 108 fisheries, 2020. ..... 76
Appendix A. 16. Weekly salmon effort in the Canadian fisheries in the Stikine River, 2020.77
Appendix A. 17. Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 2020. ..... 78
Appendix A. 18. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 2020 ..... 79
Appendix A. 19. Daily counts of adult Chinook salmon passing through Little Tahltan weir, 2020. ..... 80
Appendix B. 1. Historic salmon harvest and effort in the Alaskan District 106 commercial gillnet fishery, 1960-2020. ..... 81
Appendix B. 2 Historic salmon harvest and effort in the Alaskan District 108 commercial gillnet fishery, 1962-2020. ..... 82
Appendix B. 3. District 108 total Chinook salmon estimates in the US gillnet, troll, recreational, and subsistence fisheries, 2005-2020. ..... 83
Appendix B. 4. Annual estimates of Stikine River large Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2005-2020. ..... 83
Appendix B. 5. Chinook salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2020 ..... 84
Appendix B. 6. Chinook salmon harvest in the Canadian commercial and recreational fisheries in the Stikine River, 1979-2020. ..... 85
Appendix B. 7. Chinook salmon harvest in inriver test fisheries in the Stikine River, 1985- 2020. ..... 86
Appendix B. 8. Index counts of Stikine River large Chinook salmon escapements, 1979- 2020. ..... 87
Appendix B. 9. General stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; District 106 \& 108, 1982-2020. ..... 88
Appendix B. 10. Stikine River stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1982-2020. ..... 89
Appendix B. 11. Tahltan sockeye salmon stock proportions and harvest of in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1994-2020. ..... 90
Appendix B. 12. Stikine River sockeye salmon harvest in the U.S. Subsistence fishery, 2004-2020 ..... 90
Appendix B. 13. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2020. ..... 91
Appendix B. 14. All harvest in of sockeye salmon in Canadian commercial and assessment fisheries, 1972-2020. ..... 92
Appendix B. 15. Sockeye salmon stock proportions and harvest by stock in the Canadian commercial and assessment fishery in the Stikine River, 1979-2020. ..... 93
Appendix B. 16. Tahltan sockeye salmon stock proportions and harvest by stock in the Canadian commercial and assessment fishery in the Stikine River, 1979-2020. ..... 94
Appendix B. 17. Tahltan Lake weir data with enhanced and wild Tahltan fish, 1979-2020. ..... 95
Appendix B. 18. Sockeye salmon harvest by stock in the Stikine River under Canadian ESSR licenses, 1992-2019. ..... 95
Appendix B. 19. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2020. ..... 96
Appendix B. 20. Aerial survey counts of Mainstem sockeye salmon stocks in the Stikine River drainage, 1984-2020. ..... 97
Appendix B. 21. Stikine River sockeye salmon run size, 1979-2020. ..... 98
Appendix B. 22. Tahltan wild and enhanced sockeye salmon run size, 1994-2020. ..... 99
Appendix B. 23. Coho salmon harvest in the Alaskan District 106 and 108 test fisheries,1984-2020.100
Appendix B. 24. Annual harvest of coho salmon in the Canadian lower and upper river commercial, Telegraph Aboriginal and the Canadian test fisheries, 1979-2020. ........... 101
Appendix B. 25. Index counts of Stikine River coho salmon escapements, 1984-2020.102
Appendix B. 26. Effort in the Canadian fisheries, including assessment fisheries in the Stikine River, 1979-2020. ..... 103
Appendix B. 27. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-2020 ..... 104
Appendix B. 28. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 1984-2020. ..... 105
Appendix B. 29. Weir counts of Chinook salmon at Little Tahltan River, 1985-2020. 106Appendix C. 1. Weekly Chinook salmon estimates in the U.S. fisheries in D111, 2020.107
Appendix C. 2. Weekly Chinook salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River 2020. ..... 107
Appendix C. 3. Weekly sockeye salmon harvest of Alaskan D111 traditional and terminal hatchery access common property commercial drift gillnet fishery, 2020. ..... 107
Appendix C. 4. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery, 2020 ..... 108
Appendix C. 5. Weekly sockeye salmon abundance estimates of above border run andharvest in the Canadian fisheries in the Taku River, 2020.108
Appendix C. 6. Estmates of wild and enhanced sockeye salmon stock harvested in the Canadian commercial fishery in the Taku River by week, 2020. ..... 108
Appendix C. 7. Weekly coho salmon harvest in the traditional Alaskan District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2020. ..... 109
Appendix C. 8. Weekly coho salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2020. ..... 110
Appendix C. 9. Weekly effort in the Alaskan traditional District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2020. ..... 110
Appendix C. 10. Weekly effort in the Canadian commercial and assessment fisheries in the Taku River, 2020 ..... 111
Appendix C. 11. Daily counts of adult sockeye salmon passing through Tatsamenie Lake weir, 2020. ..... 112
Appendix C. 12. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2020. ..... 113
Appendix C. 13. Daily counts of adult sockeye salmon passing through the King Salmon Lake weir, 2020. ..... 114
Appendix C. 14. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2020. ..... 115
Appendix D. 1. Estimates of D111 traditional commercial drift gillnet harvest and effort of salmon, 1960-2020. ..... 116
Appendix D. 2. District 111 total Chinook salmon harvest in the US gillnet, sport, and personal use fisheries, 2005-2020. ..... 117
Appendix D. 3. Annual estimates of Taku River large Chinook salmon in the D111 fisheries, 2005-2020. ..... 117
Appendix D. 4. Annual Chinook Salmon harvest in the Canadian fisheries in the Taku River, 1979-2020. ..... 118
Appendix D. 5. Taku River large Chinook salmon terminal run size, 1979-2020 ..... 119
Appendix D. 6. Aerial survey index escapement counts of large (3-ocean and older) Taku River Chinook salmon, 1975-2020. ..... 120
Appendix D. 7. Annual sockeye salmon harvest in the Alaskan District 111 fisheries, includes estimates of Taku wild and enhanced fish in the gillnet, seine, and personal use fisheries, 1967-2020. ..... 121
Appendix D. 8. Stock proportions and harvest of sockeye salmon in the traditional Alaska District 111 commercial drift gillnet fishery, 1983-2020. ..... 122
Appendix D. 9. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet harvest by week, 1983-2020 ..... 123
Appendix D. 10. Annual sockeye salmon harvest estimates of wild and enhanced fish in the Canadian fisheries in the Taku River, 1979-2020. ..... 124
Appendix D. 11. Annual sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery on the Taku River, 1986-2020. ..... 125
Appendix D. 12. Annual sockeye salmon weir counts, escapements, and samples at the Tatsamenie Lake weir, 1984-2020. ..... 126
Appendix D. 13. Annual sockeye salmon weir counts, escapements, and samples at the Little Trapper weir, 1983-2020. ..... 127
Appendix D. 14. Annual sockeye salmon weir counts, escapements, and samples at the King Salmon weir, 1983-2020. ..... 128
Appendix D. 16. The terminal run reconstruction of Taku River wild and enhanced sockeye salmon-adjusted estimates, 1984-2020. ..... 130
Appendix D. 17. Annual sockeye salmon escapement estimates of Kuthai Lake and Nahlin River sockeye salmon stocks, 1979-2020. ..... 131
Appendix D. 18. Historical Taku River coho salmon harvested in D111 terminal fisheries, 1992-2020. ..... 132
Appendix D. 19. Historical coho salmon harvested in the Canadian fisheries in the Taku River, 1987-2020. ..... 133
Appendix D. 20. Historic Taku River coho salmon run size, 1987-2020. ..... 134
Appendix D. 21. Historical effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet) commercial drift gillnet fishery, 1960-2020. ..... 135
Appendix D. 22. Historical effort in the Canadian commercial fishery in the Taku River, 1979-2020 ..... 136
Appendix D. 23. Canyon Island fish wheel salmon counts and periods of operation on theTaku River, 1984-2020.137
Appendix E. 1. Weekly salmon harvest and effort in the lower Alsek River fisheries, 2020. ..... 138
Appendix E. 2. Weekly salmon harvest and effort in the Canadian Aboriginal and sport fisheries in the Alsek River, 2020. ..... 138
Appendix E. 3. Daily counts of salmon passing through Klukshu River weir, 2020. ..... 139
Appendix E. 4. Chinook salmon harvest in the U.S. fisheries in the Alsek River, 1960-
2020. ..... 141
Appendix E. 5. Klukshu River counts, harvest, and escapement of Chinook salmon, 1976- 2020. ..... 142
Appendix E. 6. Chinook salmon harvest in the Canadian Aboriginal and recreational fisheries in the Alsek River, 1976-2020. ..... 143
Appendix E. 7. Chinook salmon above border run and harvest in the Canadian Aboriginal and recreational fisheries in the Alsek River, 1976-2020. ..... 144
Appendix E. 8. Aerial survey index counts of Alsek River Chinook salmon escapements, 1984-2020 ..... 144
Appendix E. 9. Sockeye salmon harvest in the U.S. fisheries in the Alsek River, 1960- 2020. ..... 145
Appendix E. 10. Klukshu River sockeye salmon weir count, weir harvest, and escapement, 1976-2020 ..... 146
Appendix E. 11. Sockeye salmon harvest in the Canadian Aboriginal and recreational fisheries in the Alsek River, 1976-2020 ..... 147
Appendix E. 12. Alsek River sockeye salmon escapement, 2000-2006, 2012-2020. ..... 148
Appendix E. 13. Alsek River sockeye counts from U.S. and Canada, 1985-2020 ..... 148
Appendix E. 14. Coho, pink, and chum salmon harvest in the U.S. fisheries in the Alsek River, 1960-2020. ..... 149
Appendix E. 15. Klukshu River weir counts, harvest, and escapement of coho salmon, 1976-2020 ..... 150
Appendix F. 1. Tahltan Lake egg collection, fry plants, and survivals, 1989-2020. ..... 151
Appendix F. 2. Tuya Lake fry plants and survivals, 1991-2020. ..... 152
Appendix F. 3. Tatsamenie Lake egg collection, fry plants, and survivals, 1989-2020. ..... 153
Appendix G. 1. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 commercial drift gillnet, 2004-2020 ..... 155
Appendix G. 2. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 sport fisheries, 2004-2020. ..... 156
Appendix G. 3. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 commercial troll, 2020. ..... 157
Appendix G. 4. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 commercial drift gillnet, 2020. ..... 157

Appendix G. 4. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 sport fisheries, 2020. 158
Appendix G. 5. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2020. 159
Appendix G. 6. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2020.

Appendix G. 7. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2020. 161
Appendix G. 8. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery by week, 2020...... 162

## EXECUTIVE SUMMARY

The estimates of harvests and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek rivers in 2020 are presented and compared with historical patterns. Average, unless defined otherwise, refers to the most recent 10-year average (2010-2019). Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Results from TBR sockeye salmon, Oncorhynchus nerka, enhancement projects are also reviewed.

## Stikine River

The postseason estimate of the 2020 Stikine River sockeye salmon terminal run was 37,600 fish, of which approximately 19,300 fish were harvested in various fisheries including assessment/test fisheries. An estimated 17,900 Stikine River fish escaped to spawn; 380 fish were removed for broodstock. The terminal run was well below average and the harvest was well below average. The Tahltan Lake sockeye salmon total weir count of 11,200 fish was below the goal range of 18,000 to 30,000 fish. The estimated spawning escapement of 7,100 mainstem Stikine River sockeye salmon was well below the goal range of 20,000 to 40,000 fish. The estimated U.S. commercial harvest of Stikine River sockeye salmon in Districts 106 and 108, including the Stikine River subsistence fishery, was 5,900 fish. The sockeye salmon harvest in the Canadian inriver commercial was 6,200 fish and the AF harvest was 5,400 fish. There was an inriver assessment fishery that harvested 1,500 fish. Weekly inseason run projections from the SMM ranged from 50,700 to 61,800 sockeye salmon; the final inseason model prediction was 62,000 fish, with a TAC of 1,700 fish. The Stikine River sockeye salmon postseason estimated AC for the U.S. was 900 fish ( $53 \%$ of TAC) and Canada's estimated AC was 800 fish ( $47 \%$ of TAC); Canada harvested $1,540 \%$ and the U.S. harvested $680 \%$ of their respective TACs.

The estimated 2020 Stikine River large Chinook salmon terminal run was 10,303 fish, above border run was 10,150 fish, and spawning escapement was 9,760 fish; below both the escapement goal target of 17,400 fish and the escapement goal range 14,000 to 28,000 fish. The run was one of the lowest on record and the harvests were well below average. The Little Tahltan River large Chinook salmon escapement of 350 fish was well below the Canadian escapement target of 3,300 large fish and below the lower bound of the Canadian target range of 2,700 to 5,300 large fish. The estimated incidental U.S. commercial harvest of Stikine River Chinook salmon in Districts 108 gillnet, test, troll, subsistence, and sport fisheries was 160 large fish.

The 2020 run size of Stikine River coho salmon cannot be quantified. The Canadian inriver commercial harvest was 5,200 coho salmon. The U.S. mixed stock coho salmon harvest in District 106 was 43,900 fish (30\% Alaska hatchery) and District 108 was 21,100 fish (20\% Alaska hatchery).

## Taku River

The estimate of the 2020 Taku River sockeye salmon terminal run is 122,200 fish; 120,100 wild fish and 1,100 enhanced fish. The U.S. harvested 9,200 wild fish, Canada harvested 11,400 wild fish, and the estimated above border spawning escapement was 98,400 wild sockeye salmon. Total escapement was above the newly adopted escapement goal range of 40,000 to 75,000 fish and well above the recent average of approximately 70,000 fish. The U.S. and Canada harvested an estimated $18 \%$ and $92 \%$ of their respective ACs calculated using an $80 \% / 20 \%$ U.S./Canada harvest sharing split based on enhanced fish production.

The estimated 2020 Taku River large Chinook salmon terminal run was 16,000 fish, above border run was 15,690 fish, and spawning escapement was 15,590 fish; below the escapement goal range of 19,000 to 36,000 fish. The run was slightly larger than the previous four seasons but still one of the lowest on record and the harvests were well below average. The total harvest of large Chinook salmon in the Canadian commercial fishery in the Taku River was 0 fish due to the nonretention license requirement. The AF fishery harvest was 90 large fish. The estimated incidental U.S. commercial harvest of Taku River large Chinook salmon in the District 111 commercial drift gillnet, troll, personal use, and sport fisheries was 320 large fish.

The above border run estimate of Taku River coho salmon in 2020 is 59,100 fish, which was well below average. The Canadian inriver commercial harvest was 7,000 coho salmon. After all Canadian harvests are subtracted from the above border run the above border spawning escapement is estimated at 52,100 coho salmon, above the lower end of the escapement goal range of 50,000 to 90,000 fish. The estimated U.S. harvest of above border Taku River coho salmon in the District 111 commercial drift gillnet, and personal use fisheries is 2,400 fish. The U.S. had no AC while Canada harvested approximately 104\% of their AC.

## Alsek River

The 2020 Alsek River harvest of 2,500 sockeye salmon in the U.S. commercial fishery was below average. The Canadian inriver recreational fishery reported no harvest of sockeye salmon as regulations were either closed to salmon fishing or set to zero retention, while the AF fishery harvested approximately 220 sockeye salmon. The Klukshu River count of 4,400 sockeye salmon was well below average and the escapement of 4,300 fish was well below the escapement goal range of 7,500 to 11,000 fish.

The 1,330 Chinook salmon counted into the Klukshu River was above average and the estimated escapement (1,320 fish) was above the escapement goal range of 800 to 1,200 Chinook salmon. The U.S. Dry Bay harvest of 182 Chinook salmon was below average. There were no Chinook salmon harvested in the Canadian inriver recreational fishery as regulations were either closed to salmon fishing or set to zero retention, and an estimated 22 Chinook salmon were harvested in the Aboriginal food fishery.

Current stock assessment programs prevent an accurate comparison of the Alsek River coho salmon run with historical runs. There was minimal effort during the U.S. Dry Bay
coho salmon fishery and harvest figures are negligible. The Canadian recreational fishery harvested 6 coho salmon, and Aboriginal fisheries harvested no coho salmon. The Klukshu River enumeration program does not provide a complete enumeration of coho salmon into this system since it is removed before the run is complete.

## Enhancement

In 2020, eggs and milt were collected from sockeye salmon at Tahltan, Tatsamenie and Trapper lakes. An estimated 1.7 million eggs were collected at Tatsamenie Lake and 0.5 million eggs were collected at Trapper and Tahltan lakes. Lower than average fecundity means less eggs are available than originally estimated. Canadian technical staff revised the Tahltan Lake egg-take goal to 0.5 million sockeye salmon eggs inseason based on expected wild smolt production and stocking guidelines limiting enhanced production to less than $50 \%$ of the smolt leaving the lake. In 2020, no egg takes were planned at King Salmon Lake.

In 2020, outplants of brood year 2019 sockeye salmon fry were 2.7 million fry into Tahltan Lake; 1.4 million fry were released directly to Tatsamenie Lake and 0.21 million fry were reared in net pens before being released into the lake; and 0.26 million fry were released into Trapper Lake.

Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate weekly contribution of fish from U.S./Canada TBR fry planting programs to U.S. District 106, 108, and 111 fisheries and to Canadian lower commercial and test fisheries in the Stikine and Taku rivers. Postseason estimates of stocked fish to Alaskan harvests were 2,250 Stikine River fish to District 106 and 108, and 200 Taku River fish to District 111. Postseason estimates of stocked fish to Canadian fisheries included 8,500 fish to Stikine River fisheries and 570 fish to the Taku River fisheries.

## INTRODUCTION

This report presents estimates of the 2020 harvest and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek rivers and describes management actions taken during the season. Harvest and effort data are presented by week, for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku rivers are also summarized.

The TTC met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: PSC TTC, TCTR (20)-1 Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers, 2020.

Run reconstruction analyses are conducted on the sockeye salmon Oncorhynchus nerka and Chinook salmon $O$. tshawytscha runs to the Stikine and Taku rivers and to the Taku River for coho salmon $O$. kisutch for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine harvest are made for Alaskan fisheries outside of District 106 and 108 for Stikine River stocks, District 111 for Taku River stocks and Subdistrict 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial drift gillnet, troll, recreational and subsistence fisheries in Alaskan Districts 106 and 108. Canadian harvest occurs in commercial gillnet and assessment/test fisheries located within the Stikine River, and by a Canadian AF in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are occasionally operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A recreational fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a U.S. personal use fishery was established in the lower Stikine River; no harvests were reported in this fishery in 1995 through 2000. Approximately 30 sockeye salmon were harvested in 2001. The personal use fishery on the Stikine River was not open in 2002 and 2003. A U.S. subsistence fishery was opened in 2004 for sockeye salmon and in 2005 for Chinook and coho salmon.

In 1993, the U.S. spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108. The three areas in District 108 and one area in District 106 have remained unchanged and have opened in the absence of District 108 directed Stikine River Chinook salmon fisheries.

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m} 3$ of debris into the river which may have restricted access to Tahltan River Chinook and sockeye salmon spawning sites during high flows (until about mid-July 2014). In March 2015 select boulders at the landslide were demolished
using an industrial expansion compound set into drill holes within the boulders. The resulting fragments were displaced downstream by manual labor and by the erosional effects of the spring freshet. The exercise resulted in an increase in the channel width, ridding the site of a "pinch point" where it was observed that salmon struggled in their attempts to ascend the river in 2014. Radio telemetry studies in 2015 and 2016 showed that the landslide was not a significant barrier to Chinook salmon, however Tahltan River water levels were well below average during the Chinook migration. In winter 2017/2018 significant work was completed at the landslide to improve fish passage by the blasting of large instream debris. On site monitoring in 2018 under extremely low water conditions indicated that Chinook and sockeye salmon passage was not delayed significantly. Sockeye and Chinook salmon passage was again assessed with radio telemetry in 2019. Results of the 2019 telemetry project are pending and will be provided in the forthcoming Pacific Salmon Commission Northern Endowment Fund project report.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Fishing arrangements in place for salmon originating from the Canadian portion of the Stikine River watershed are provided in Annex IV, Chapter 1 of the PST and can be found at https://www.psc.org/publications/pacific-salmon-treaty. These arrangements include directed fisheries for Chinook salmon; continuation of a U.S. subsistence fishery on Chinook, sockeye, and coho salmon stocks within the U.S. section of the Stikine River; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the estimated production of enhanced fish.

The TTC meets prior to the season to update joint management and enhancement plans, develop run forecasts, and determine new parameters for input into the inseason Chinook and sockeye salmon run projection models. The Chinook salmon model is referred to as the SCMM and serves as a key management tool governing weekly fishing regimes for Stikine River Chinook salmon. The SCMM is complemented inseason with a concurrent MR study and other inriver assessment methods. The sockeye salmon model is referred to as the SMM, which was complemented inseason with concurrent inriver run size estimates based on fishery performance against historical fishery performance and run size estimates.

## Chinook Salmon

The SCMM model described above is based on the linear regression (correlation) between weekly cumulative CPUE of large Chinook salmon at the tagging site, located near the mouth of the Stikine River, and inriver run size based on annual inseason MR studies conducted from 1996 to 2019. The CPUE and run size data sets (CPUE vs. run size) are significantly correlated, although there are statistical challenges with the SCMM at low CPUE levels such as those seen in 2020 as they lie outside of the established relationship. Generalized inseason model estimates were generated commencing in SW 20 but were primarily for information purposes as there were no directed inriver commercial fisheries (Table 1). Traditional MR estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were unavailable due to low catch rates during the first event and no retention in the commercial fisheries (second event). The SCMM was the only available indication of run strength during the Chinook salmon reporting period. In order to abide by Annex IV, Chapter1, Paragraph 3(a)(3)(vii), which obliges the Parties to apportion their overall TAC by historical weekly run timing, weekly fishery openings were announced based on weekly guideline harvests.

The preseason forecast estimate of 13,350 large Chinook salmon was below the threshold run size limit of 28,100 fish (Table 1); hence, there were no directed Chinook salmon fisheries in the U.S. and Canada. The threshold number is the sum of the midpoint escapement goal ( 21,000 fish $)+$ the Canadian BLC ( 2,300 fish $)+$ the U.S. BLC $(3,400$ fish) + the inriver assessment/test fishery harvest ( 1,400 fish). In conjunction with the AC associated with the directed fishery, both U.S. and Canada are permitted a base level catch harvested as bycatch taken in the course of the targeted sockeye salmon net fisheries and Chinook salmon taken in traditional recreational fisheries. In response to conservation concerns for Chinook salmon in 2020, the Canadian directed sockeye salmon fishery
opening was delayed by one week (to SW 26) to avoid Chinook salmon bycatch, and once the sockeye fishery opened, fishermen were required to release all Chinook salmon bycatch.

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and MR estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, troll, and subsistence fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2020.

|  | Terminal Run |  |
| :---: | :---: | :---: |
| SW | Estimate | Method |
| 19 | 13,350 | Preseason |
| 20 | 13,350 | Preseason |
| 21 | $<14,000$ | SCMM |
| 22 | $<14,000$ | SCMM |
| 23 | $<14,000$ | SCMM |
| 24 | $<14,000$ | SCMM |
| 25 | $<14,000$ | SCMM |
| 26 | $<14,000$ | SCMM |
| 27 | $<14,000$ | SCMM |
| 28 | $<14,000$ | SCMM |
| 29 | $<14,000$ | SCMM |

The preseason forecast for the Stikine River large Chinook salmon terminal run was approximately 13,350 large Chinook salmon (Table 1), which indicated a run size characterized as well below average. Joint Canadian and U.S. inseason predictions of terminal run size were all less than 14,000 large Chinook salmon (Table 1). Project biologists used the daily catch and effort data transmitted from the Kakwan Point tagging site to make weekly run projections based on the SCMM model. Joint weekly run size estimates were calculated on Wednesday or Thursday of the current week. Given the very low run strength and paucity of spaghetti tags recovered inseason, managers used the preseason forecast during SW 19-20 and used only the SCMM to generate a directional estimate (i.e. $<14,000$ ) weekly through the remainder of the Chinook salmon reporting period. Point estimates were not statistically defensible due to the inseason model data lying outside of the established relationship to CPUE and run size as determined by the MR. The first inseason estimate was generated in SW 21.

## Sockeye Salmon

The preseason forecast for the Stikine River sockeye salmon run was approximately 103,000 fish and was characterized as below average run. The forecast included approximately 30,000 wild Tahltan, 34,000 enhanced Tahltan, and 39,000 mainstem sockeye salmon. It is believed that final returns of Tuya implants were observed in 2019; none were expected in 2020. The preseason forecast was used for management purposes from SW 25 to 27 and the SMM was used beginning in SW 28.

Starting in SW 28, weekly inputs of the harvest, effort, and stock composition were entered into the SMM to provide weekly forecasts of run size and TAC. Specific inputs include proportion Tahltan/Tuya from egg diameters, proportion enhanced Tuya from thermal mark analyses of otoliths in the Canadian lower river test (when in operation) and commercial fisheries; the upper river harvest in the AF and upper river commercial fishery; the catch, effort and assumed stock composition in Subdistrict 106-41 (Sumner Strait), Subdistrict 106-30 (Clarence Strait), and District 108.

The SMM provides inseason projections of the Stikine River sockeye salmon run, including the Tahltan stock (wild and enhanced combined), the enhanced Tuya stock, and the mainstem stocks. The SMM predicts run size for each week of the fisheries using linear regression of historical stock specific harvest data and cumulative CPUE. It breaks the stock proportions in District 106 and 108 harvests, using historical postseason scale pattern analysis (SPA), into triggers of run size for Tahltan and Mainstem; the averages used each week depended upon whether the run was judged to be below average ( $0-40,000$ fish), average ( $40,000-80,000$ fish), or above average ( $+80,000$ fish). The SMM for 2020 was based on CPUE data from 1994 to 2017 from the Alaska District 106 fishery and the Canadian commercial fishery in the lower river and from the lower Stikine River test fishery from 1986 to 2004. The enhanced Tuya and Tahltan stock proportions are adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108 harvests.

Generally, the SMM has used the Canadian Lower River Commercial (LRCF) fishery CPUE to estimate the inriver run size; however, the Lower River Assessment fishery CPUE data was available to enter into the SMM model to compare and contrast the respective run sizes generated from each of the inputs. In 2020 the upper commercial fishing zone (Flood fishery) was not opened for harvest; in years that it is opened, the harvest and effort from this area are excluded from the CPUE and not used in the model estimate. The annual weekly CPUE values were adjusted in order to make the current year data comparable with historical CPUE. For example, during 1979-1994 and 2000-2004, 2010-2016, only one net per license was permitted, while in 1996-1999 and 2005-2009 two nets per license were allowed. Only one net was permitted in the 2019 fishing season.

The Stikine Forecasting Management Model (SFMM) was also used in season, as decided by the TTC. The SFMM and assessment results were summarized in the PSC Technical report No. 38 Stikine Sockeye Salmon Management Model: Improving Management Uncertainty. This model was based on a second order polynomial relationship between weekly cumulative harvest or CPUE in District 106-41 and yearly run size. Triggers of run size for the Tahltan stock were $\leq 98,000$ fish or $>98,000$ fish in the District 106-41 fishery, and $0,<46,000$ fish, or $>175,000$ fish in the District 108 fishery. Triggers were not used for the mainstem stock. Additional model runs using cumulative harvest or CPUE in the District 108 sockeye salmon area was also tested. The sockeye salmon area harvest and CPUE in District 108 does not include 108-20 and 108-10 fishing areas, or midweek openings.

Table 2. Weekly forecasts of run size, total allowable harvest for Stikine River sockeye salmon, and cumulative Stikine River harvest as estimated inseason by the Stikine Management Model and other methods, 2020.

${ }^{\mathrm{a}}$ Total count of fish pass the traditional fisheries.
${ }^{\mathrm{b}}$ Harvest allowed in terminal areas under the Excess Salmon to Spawning Requirement license.
${ }^{c}$ Fish returning to the Tuya system are not able to access the lake where they originated due to velocity barriers.
${ }^{\mathrm{d}}$ The number of Tuya fish that should be passed through traditional fisheries in order to harvest the Tuya stock at the same rate as the Tahltan stock to ensure adequate spawning escapement for Tahltan fish.
${ }^{\mathrm{e}}$ Includes traditional, ESSR, and test fishery Harvestes.
${ }^{\mathrm{f}}$ Does not include ESSR or test fishery Harvestes.
${ }^{\mathrm{g}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for Harvestes other than in the listed fisheries.

## U.S. Fisheries

The Stikine River large Chinook salmon preseason forecast of 13,400 fish was insufficient to allow for directed fisheries. In District 108, restrictions implemented in the drift gillnet fishery to reduce harvest of Stikine River Chinook salmon included a two-week delay of the initial opening with area and mesh restrictions implemented through SW 29. Due to recent and expected poor performance of Chinook salmon runs throughout SE Alaska, restrictions in the District 106 fishery were implemented as well. The District 106 opening was delayed one week and a six-inch maximum mesh restriction was in place for the first three openings.

The Stikine River sockeye salmon preseason forecast indicated a below average terminal run size of 103,400 fish, with a resulting U.S. AC of 25,970 fish (Table 2). Preseason forecasts were the primary basis of management during SWs 25 through 28. Inseason estimates of terminal run sizes were first produced on a weekly basis beginning in SW 28 and were used from SW 29 through SW 32. Inseason abundance estimates were variable and ranged between 27,200 and 59,900 sockeye salmon (Table 2). The postseason Stikine River sockeye salmon run estimate of 37,584 fish resulted in an U.S. AC of 869 sockeye salmon. The total U.S. harvest was estimated to be 5,931 fish, based on GSI analysis (Table $3)$.

The 2020 District 106 drift gillnet fishery was open for 33 days from June 21 through September 22. Total fishing time was below average ( 47 days). Weekly participation was below average through SW27, then rose to above average for SW's 28 to 31. Effort during the pink salmon management period (SWs 32 through 35) was below average and remained below average for the remaining weeks of the coho management period. The number of permits ranged between 78 permits fished in SW 31 to 19 permits fished in SW 39. Total season effort of 1,588 boat days was below the average of 2,648 boat days.

Total salmon harvest in the District 106 drift gillnet fishery was below average and included 1,182 Chinook, 11,314 sockeye, 43,850 coho, 127,583 pink, and 143,577 chum salmon. Chinook, sockeye, coho, and pink salmon harvests were below average, while the chum salmon harvest was average. An estimated 900 Chinook salmon (75\%) of the District 106 harvest were of Alaska hatchery origin. An estimated 1,864 Stikine River sockeye salmon were harvested in District 106, approximately $17 \%$ of the harvest (Table 3). An estimated 13,300 coho salmon ( $30 \%$ ) of the District 106 harvest were of Alaska hatchery origin.

Stikine River sockeye salmon harvests in the two fishing areas of District 106 were markedly different. In the Sumner Strait fishery (Subdistrict 106-41), 7,797 sockeye salmon were harvested, of which 1,638 fish were estimated to be Stikine River sockeye salmon and contributed $21 \%$ of the total sockeye salmon harvest in that subdistrict. In the Clarence Strait fishery (Subdistrict 106-30), 3,517 sockeye salmon were harvested, of which 281 fish were estimated to be Stikine River sockeye salmon, which contributed $8 \%$ of the total sockeye salmon harvest in that subdistrict (Table 3).

The District 108 drift gillnet fishery was opened for a total of 27 days starting June 28 (only 7 days for SW's 27-29). Total fishing time was below average (49 days), excluding years with directed Chinook salmon fishing, and closed concurrently with District 106 on September 22. Participation in District 108 was below average most weeks, except for SW 33 and SWs 36 through 38. The total season effort of 833 boat days was well below average (1,609 boat days).

Total salmon harvest in the District 108 drift gillnet fishery was well below average and included 2,617 Chinook, 2,781 sockeye, 20,981 coho, 11,798 pink, and 53,677 chum salmon. Chinook, sockeye, pink, and chum salmon harvests were below average, while the coho salmon harvest was average. Harvest of large Chinook salmon through SW 29 totaled 1,086 fish, of which 62 were identified as above border Stikine River origin through GSI. Of the sockeye salmon harvest, an estimated 2,252 Stikine River sockeye salmon were harvested, which contributed $81 \%$ of the District 108 sockeye salmon harvest. An estimated 4,261 fish (20\%) of the District 108 coho salmon harvest were of Alaska hatchery origin.
U.S. harvest of Stikine River large Chinook salmon in all District 108 fisheries were minimal and well below the U.S. BLC. The District 108 drift gillnet fishery estimated harvest of Stikine River large Chinook salmon was 61 fish. The District 108 Spring Troll fishery was closed for 2020. Commercial trolling opened in District 108 for the Summer Troll fishery on July 1 with nonretention of Chinook salmon in effect. The District 108 sport fishery implemented nonretention of Chinook salmon from April 1 through July 15. A small area inside District 108, adjacent to City Creek in Petersburg, was open for the retention of Chinook salmon from June 15 through July 31 to target Alaska hatchery Chinook salmon in this location. Harvest of Stikine River large Chinook salmon in the sport fishery was estimated to be 93 fish. Cumulative U.S. District 108 base level fishery harvest by all gear groups through SW 29 was estimated to be 161 fish, well below the U.S. BLC of 3,400 Stikine River large Chinook salmon.

In 2020, U.S. subsistence fisheries targeting sockeye and coho salmon occurred on the Stikine River. The directed subsistence Chinook salmon fishery was not opened. Subsistence fishing was restricted to federally qualified users, required a permit issued by the U.S. Forest Service, and was limited to the U.S./Canadian border to marine waters at the mouth of the Stikine River. Fishing in "clearwater" tributaries, side channels, or at stock assessment sites was also prohibited. Annual guideline harvest levels were 600 sockeye and 400 coho salmon. Allowable gear for the fishery included dipnets, spears, gaffs, rod and reel, beach seine, and gillnets not exceeding 15 fathoms in length with mesh size no larger than $51 / 2$ inches. A total of 6 large Chinook salmon were harvested incidentally during the subsistence sockeye salmon fishery through SW 29. Subsistence fishing was allowed from June 21 through July 20 to target sockeye salmon and from August 4 through October 1 to target coho salmon. In 2020, a total of 119 permits were issued and the estimated harvests included 6 large Chinook, 1,760 sockeye, and 70 coho salmon.

The initial directed sockeye opening occurred in District 106 in SW 26 and opened at 12:00 noon on Sunday, June 21, for an initial 2-day period with a six-inch maximum gillnet mesh
restriction in place. On the grounds surveys indicated low sockeye salmon abundance and no additional fishing time occurred. Effort was comprised of 4 boats in Clarence Strait (106-30) and 28 boats in Sumner Strait (106-41). An estimated 160 Stikine River sockeye salmon were harvested in the District 106 drift gillnet fishery in SW 26.

In SW 27 (June 28-July 4), Districts 106 and 108 opened for an initial 2-day period with a six-inch maximum gillnet mesh restriction in place. Additionally, an expanded area off the Stikine River delta in District 108 was closed. On the grounds surveys indicated a well below average effort in both Districts and a sockeye salmon abundance below average, but on an increasing trend. Considering the low effort and the AC of the Stikine sockeye salmon provided by the preseason forecast, a 24-hour extension occurred. Effort was 17 boats in Clarence Strait (106-30), 28 boats in Sumner Strait (106-41), and 24 boats in District 108. An estimated 1,526 Stikine River sockeye salmon were harvested in Districts 106 and 108 drift gillnet fisheries in SW 27.

Districts 106 and 108 opened for an initial 2 days in SW 28 (July 5-July 11) with a sixinch mesh restriction in both districts. On the grounds surveys indicated sockeye salmon abundance in both districts well below the level to allow for additional time. There was Stikine sockeye salmon AC available for the U.S., but the opening was limited to two days due to lack of sockeye salmon abundance in both marine and inriver fisheries resulting in low confidence in the preseason forecast. An estimated 915 Stikine River sockeye salmon were harvested this week. Effort included 30 boats in Sumner Strait (106-41), 24 boats in Clarence Strait (106-30), and 28 boats in District 108.

During SW 29 (July 12-July 18), Districts 106 and 108 were opened for an initial 2 days. The first inseason forecast of Stikine River sockeye salmon terminal run size generated this week was 27,200 fish, which resulted in no U.S. AC and considerably below the preseason forecasts (Table 2). Additionally, on the grounds surveys indicated sockeye salmon abundance in both districts well below the level to allow for additional time. An estimated 959 Stikine River sockeye salmon were harvested this week in the U.S. and the cumulative harvest through SW 29 was estimated to be 3,560 fish. Effort was below average and included 31 boats in Clarence Strait (106-30), 28 boats in Sumner Strait (106-41), and 18 boats in District 108.

Districts 106 was opened for a total 2 days during SW 30 (July 19-July 25). Opening time for District 106 was limited to 2 days for SWs 29 through 31 due to McDonald Lake sockeye salmon concerns. Due to the continued low abundance of Stikine sockeye salmon in both marine and inriver fisheries, District 108 was closed in SW 30. Harvest rates of sockeye salmon in District 106 remained below average while effort increased with 43 boats in Clarence Strait (106-30), 28 boats in Sumner Strait (106-41). The overall SMM run size assessment this week increased to 50,100 sockeye salmon, increasing the run size for the Tahltan component, while the mainstem component stayed about the same. The resultant U.S. AC remained at zero fish (Table 2). An estimated 95 Stikine River sockeye salmon were harvested in SW 30 with a cumulative harvest of 3,654 fish.

District 106 opened for 2 days during SW 31 (July 26-August 1). District 108 remained closed to conserve Stikine sockeye salmon. Sockeye salmon harvest rates continued to be below average this week. Very little change in run size estimates and the corresponding U.S. ACs produced by SMM predictions in SWs 31 and 32 with a projected run size of 54,800 and 60,000 fish respectively and zero U.S. AC. U.S. An estimated 197 Stikine River sockeye salmon were harvested in District 106 this week. An additional 320 Stikine sockeye salmon were harvested in Districts 106 and 108 for the remainder of the season with a cumulative harvest of 4,171 fish for the year. Effort remained above average with 43 boats in Clarence Strait (106-30) and 35 boats in Sumner Strait (106-41).

During SWs 32 through 35 (August 2-August 29), both Districts 106 and 108 were managed based on pink salmon abundance. That portion of Section 6-D in District 106 along the Etolin Island shoreline was closed to gillnet fishing from SW 32 through SW 35 by regulation. Both districts opened for two days in SW 32, then three for SW 33 and then back to two days in SWs 34 and 35. Effort in District 106 was below average during this period. Likewise, effort in District 108 was below average during most of the pink salmon management period except for SW 33 when effort was just above average.

Beginning in SW 36 (August 30-September 5), emphasis transitioned to coho salmon management that focuses on wild coho salmon abundance. Before the coho salmon management period, 16,700 coho salmon, approximately $38 \%$ of the total District 106 harvest, had been harvested. The hatchery contribution was approximately 2,539 fish in District 106 prior to SW 36 and was comprised primarily of releases from Neck Lake. During the coho salmon management period, coho salmon harvests were below average in District 106 with an estimated harvest of 13,274 hatchery fish and 30,576 wild coho salmon. Harvest of wild coho salmon in District 108 was above average during the coho salmon management period with an estimated harvest of 14,600 fish. Both districts were open for three days during most weeks except for the last week when they were opened for two days. The 2020 drift gillnet season concluded at noon on Tuesday, September 22, in both districts.

## Canadian Fisheries

The Chinook salmon assessment fishery was not conducted in 2020 in response to the poor preseason forecast and the decision to maximize the number of fish returning to the spawning grounds. A sockeye salmon assessment fishery was conducted for stock assessment purposes in the lower Stikine River from 25 June (SW 26) to 21 August, 2020 (SW 34). The assessment fishery was located immediately upstream from the Canada/U.S. border. Assessment fishery harvest totaled 1,497 sockeye, 103 coho, 917 pink, 79 chum salmon, plus catch and release of 67 large, 42 nonlarge Chinook salmon and 21 steelhead trout. The objectives of the sockeye salmon assessment fishery were, similar to those in previous years, to provide inseason harvest, stock ID and effort data for input, if necessary, into the SMM to estimate the inriver run size; and, to determine migratory timing and stock composition of the sockeye salmon run for use in the postseason estimates of the inriver sockeye salmon run.

The coho salmon assessment fishery has not been conducted in the lower Stikine River many years and was not conducted in 2020.

## Lower Stikine River Commercial Fishery

The Canadian commercial fishery on the lower Stikine River harvested 6,153 sockeye, 5,101 coho, 167 pink, and 73 chum salmon. A total of 749 large Chinook, 695 nonlarge Chinook, 364 pink, and 136 chum salmon, as well as 402 steelhead, were released in 2020. There was no directed Chinook salmon fishery, and all Chinook salmon caught incidentally in the directed sockeye and coho salmon fisheries (SWs 26-32 and 35-37) were released. There was no directed sockeye commercial fishery in (SW's 33-34) due to mainstem conservation concerns. Additional conservation measures were taken in sockeye salmon fishery. As a result of this precautionary approach, fishery impacts on Chinook salmon were minimal. The harvest of sockeye and coho salmon were well below average and average, respectively.

As noted, there was no directed fishing effort for Chinook salmon in 2020. Sockeye salmon were targeted for a total of 90.8 licence days, well below the average of 304 licence days. The coho salmon fishery effort amounted to 123 licence days, close to the average of 114 licence days.

The stock composition of the lower river commercial sockeye salmon harvest was 2,603 enhanced Tahltan fish, which accounted for $42 \%$ of the sockeye salmon harvest; 2,120 wild Tahltan sockeye salmon accounting for $34 \%$ of the harvest; 1,429 mainstem fish accounting for $23 \%$ of the harvest. There were no enhanced Tuya sockeye salmon harvested in 2020 (Table 3).

Typically, weekly Chinook and sockeye salmon guideline harvests, based on SCMM, SMM and MR forecasts of the TAC apportioned by average run timing and domestic and international allocation agreements, are developed each week to guide management decisions during the Chinook and sockeye salmon seasons. For 2020, weekly inseason run projections for Chinook salmon were not made, as assessment information was largely absent. The poor run size meant low catches at Kakwan Point, resulting in not only a less effective SCMM, but a low number of tags applied for the MR project. Fishery conservation measures resulted in minimal tag recovery, compounding the effect on inseason MR estimates. In most years, after SW 25, for the purpose of managing the lower river catch, 800 large Chinook salmon are allocated to the upper Stikine River fisheries. The allocation consists of 100, 20, and 680 large Chinook salmon in the recreational, upper commercial and Aboriginal fisheries (AF) respectively. In 2020, as in 2019, the allocation of Chinook salmon to the respective fisheries was not made as restrictions were put in place to eliminate the harvest of Chinook salmon in all fisheries, specifically, the release of all Chinook salmon caught. A total of 7,000 sockeye salmon was allocated to the upper Stikine River commercial and AF. The balance of the sockeye salmon TAC was allocated to the lower Stikine River commercial fishery. Particular attention was directed at the inriver run and escapement projections of the various sockeye salmon stock groupings. From SW 26 through SW 29, management emphasis was on the Tahltan sockeye salmon stock; after
this, the focus was on mainstem sockeye salmon. The coho salmon management period began on SW 35.

The preseason forecast of 13,350 large Chinook salmon was far below the threshold of 24,500 fish that would trigger a directed fishery. In response to the poor forecast, Canada made the decision to implement restrictions/modifications to the management of the directed sockeye salmon fishery in the lower Stikine River. If Chinook salmon escapement had not been a concern in 2020, the directed sockeye fishery could have opened as early as 14 June (SW 25) but in response to the Chinook salmon situation, the sockeye salmon fishery did not commence until 23 June (SW 26) to allow for the majority of the Chinook salmon return to pass through the lower Stikine River. Additionally, licence holders were required to release all incidentally caught Chinook salmon. Openings in SW 26 were restricted to the daylight period to in order to implement a requirement to pick set nets at least once every 30 minutes. The maximum mesh size was kept at $14.0 \mathrm{~cm}(\sim 5.5$ inches) until the start of the coho salmon management period (SW 35) to further reduce interceptions and avoid gilling large Chinook salmon.

Annex IV, Chapter 1, paragraph 4 of the PST prescribes that either Party takes corrective action in the event that a Party exceeds its catch allocation in any three of five consecutive years. In 2018, as in 2017, fisheries management actions based on bilaterally agreed to inseason run size information resulted in Canada exceeding its sockeye salmon allocation for the third time in the previous five years. In response, Canada reviewed its management actions for 2017 and in 2018 in relation to the stock assessment information available during the fishing season. It was found that the preseason forecast was significantly higher than the postseason run estimate, resulting in early season fishing opportunity (SW26-27) that led Canada to exceed its weekly guidelines. Once inseason information became available, run projections dropped significantly but still exceeded the postseason run estimate which further exacerbated Canada's ability to manage within its AC.

In an attempt to align the Canadian harvest with its allocation in 2020, Canada was to implement the following measures based on anticipated fishing conditions (water levels) and effort (11 licences) being similar to 2017-2018:

- Preseason forecast adjusted to reflect the recent Tahltan Lake sockeye (smolt to adult) survival rates - to inform management in SWs 26 and 27;
- For SWs 28-34: inseason projections for 2017-2019 were well above the postseason estimates therefore fishery opportunities (effort) were to be provided conservatively;
(Note: some of the harvest figures listed in the following narrative may not match the final harvest records listed in the tables. This is due to slight changes in the harvests as a result of a postseason check of the catch slips, updated stock composition information, and assessment of Chinook salmon large versus nonlarge size ratios.)

In SW 26 (21-27 June), the fishery opened (delayed by eight days) for sockeye salmon, which was centered on the Tahltan stock group and was expected to remain so until SW 29. Fishers were permitted one net only and the commercial fishing area remained the same as recent years, which was from the Canada/U.S. border upstream to a location near the mouth of the Porcupine River. The area included the lower 10 km reach of the Iskut River. The use of set nets was permitted as along as net checks occurred no less than every 30 minutes. In order to facilitate this, openings were restricted to daylight periods only. The overall Canadian sockeye salmon AC of 23,000 fish was comprised mainly of Tahltan Lake sockeye salmon based on the preseason run size expectations of 64,000 Tahltan Lake fish and 39,000 mainstem sockeye salmon.

The initial opening was for an 18 -hour period, beginning at 0500 hrs on Tuesday June 23. The guideline harvest for sockeye salmon was 1,500 fish. An additional 18 hours were provided but extreme high water, poor fishing conditions, and low catch rates provided little incentive to continue fishing and licence chose not to fish the remaining 11 hours of the opening. The sockeye harvest was only 2 for the week. A total of 44 large Chinook salmon were caught and subsequently released.

The following week, SW 27 (28 June - 4 July), the fishery started at noon with a 72-hour opening. The guideline harvest was 2,900 Tahltan Lake sockeye salmon, as per the preseason forecast. Set net restrictions remained in place for Chinook salmon conservation concerns. No additional fishing time was provided. The final harvest for the week consisted of 666 sockeye salmon, which were estimated to be $89 \%$ Tahltan Lake origin fish. A total of 84 large Chinook salmon were released. The Tahltan sockeye salmon fbd was 22, well below the average of 122 .

The SW 28 (5-11 July) fishery was posted for an initial 72-hour period; using the preseason forecast the guideline harvest was $\sim 2,700$ sockeye salmon. No additional fishing time was added for the week. The harvest for the week consisted of 1,467 sockeye salmon. The stock composition was estimated to be $97 \%$ Tahltan and $3 \%$ mainstem sockeye salmon. The week's Tahltan Lake sockeye salmon fbd of 68 was below average ( 115 fbd ). Week 28 marks the historical peak of the Tahltan Lake sockeye salmon through the fishery.

In SW 29 (12-18 July) the fishery was posted for an initial 48-hour opening. The fishery was not extended due to concerns that the Tahltan Lake sockeye salmon run was weaker than forecasted. The week's effort yielded a harvest 2,119 sockeye salmon of which $91 \%$ were of Tahltan origin and $9 \%$ were mainstem. The Tahltan sockeye salmon CPUE was 121 fbd , above the average of 81 fbd . The post SW 29 run size estimate suggested a run size of approximately 74,000 Stikine River sockeye salmon. The Tahltan Lake component was estimated at 40,000 fish; below the preseason forecast but consistent with inseason information to date.

For SWs 30-33, the fishery was opened for a day in each of the three weeks. Licence holders fished in SWs 30-32 but chose not to in SW33 due to extremely weak sockeye salmon catches in the previous three weeks and concerns for the mainstem sockeye salmon run. SW 32 marked the last opening fished in the directed sockeye salmon commercial
fishery. By the end of SW 32, Canada had harvested a total of $\sim 5,300$ sockeye salmon in the commercial fishery of which 4,600 were of Tahltan origin and 700 were mainstem. The FSC fishery was ongoing and the harvest was $\sim 5,200$ sockeye salmon up to SW32.

In SW 35 (23-29 August), the directed coho salmon fishery was delayed until August 25 and opened for only 48 hours due to concerns for mainstem sockeye salmon abundance. A total of eight licences were fished. Canada's allocation for coho salmon was 5,000 fish for the season with the intention of spreading the harvest over SWs 35-37. The coho salmon CPUE for the week was 24 fbd , below the average of 37 fbd . The harvest was 384 coho and 128 sockeye salmon.

In SW 36 (30 August - 5 September), the fishery was opened for an initial 72-hour period. An average of 10 licences fished each day. After two days the fishery was extended for an additional 48 hours based on near average catch rates, resulting in a weekly harvest of 2,212 coho and 605 sockeye salmon.

For SW 37 (6-12 September), the fishery was opened for an initial 72-hour period. An average of eight licences fished each day. The fishery was extended for an additional 96 hours based on continued average catch rates and a weekly target of approximately 2,400 coho salmon. The resulting weekly harvest was 2,502 coho and 198 sockeye salmon.

The season total coho salmon harvest was 5,101 fish. Three coho salmon were harvested during the sockeye salmon fishery and these fish do not count toward the 5,000 fish allocation as prescribed in the PST.

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek, B.C., on the upper Stikine River since 1975. As per the lower Stikine commercial fishery, retention of Chinook salmon was not permitted in 2020. The fishing effort this year amounted to four boat days over SWs 30-33 with one active licence per opening. A total of 296 sockeye salmon were harvested which was below average. No Chinook salmon were encountered. Generally, fishery openings are based on the lower Stikine commercial fishery openings, lagged one week.

## Aboriginal Fishery

The upper Stikine Aboriginal fishery, which is also located near Telegraph Creek, harvested 389 large Chinook, 642 nonlarge Chinook and 5,423 sockeye salmon in 2020. Effort was below average due in large part to the local travel restrictions in place to protect public health during the pandemic. The harvest of large Chinook salmon was below average and the sockeye salmon harvest was average. The sockeye salmon harvest was almost entirely comprised of the Tahltan Lake run. Typically, about $90 \%$ of the sockeye salmon harvest takes place prior to August but was later than normal in 2020 due to run timing.

## Recreational Fishery

The Stikine River salmon recreational fishery targets primarily Chinook salmon and most activity takes place at the mouth of the Tahltan River. Some fishing occurs in the upper reaches of the Tahltan River and in select tributaries of the Iskut River, including the Verrett and Craig rivers. There was no harvest of Chinook salmon in the recreational fishery in 2020. Restrictions were in place starting April 01 that did not permit the retention of Chinook salmon of any size in the waters of the Stikine River. Additionally, the Tahltan River was closed to recreational salmon fishing effective June 01 through August 31. Access to fishing sites near the mouth of the Tahltan River was restricted by the Tahltan First Nation Chief and Council in order to reduce potential impacts on Little Tahltan River bound Chinook salmon.

## Escapement

## Sockeye Salmon

A total of 11,158 sockeye salmon were counted into Tahltan Lake from July 7 (weir in) to September 11 (weir out). The total Tahltan Lake sockeye salmon escapement estimate of 11,158 fish is well below the average and below the escapement goal range of 18,000 to 30,000 fish. Of the total counted through the weir, an estimated 6,477 fish originated from the enhancement program. A total of 384 sockeye salmon were collected for broodstock and no fish were retained for stock identification purposes at the weir, resulting in a total natural spawners escapement of 10,774 sockeye salmon to Tahltan Lake.

The spawning escapements for the mainstem stock group is calculated using stock identification, assessment fishery, and inriver commercial harvest data. The mainstem sockeye salmon escapement estimate was 7,126 fish, which is the lowest on record and below the target escapement of 30,000 fish, and below the escapement goal range of 20,000 to 40,000 fish.

The aerial survey counts of mainstem sockeye salmon occurred on September 15th and were well below average at most index sites which was expected given that there was no mainstem directed fishery prosecuted in SW's 33-34 in 2020 due to conservation concerns.

## Chinook Salmon

In order to assess inriver Chinook salmon abundance in 2020, a MR study was conducted. Inseason MR estimates for large chinook salmon, however, were not calculated in 2020 due to the low number of marks deployed, and Chinook salmon retention not being permitted in inriver fisheries. The postseason Stikine River spawning escapement estimate of 9,753 large Chinook salmon is based on tag recoveries from Chinook salmon caught and released in directed sockeye salmon commercial fisheries, the AF, and the Little Tahltan video weir observations. This is below the average escapement of 15,500 large fish, and below the escapement goal range of 14,000 to 28,000 large chinook salmon.

The 2020 Chinook salmon escapement enumerated at the Little Tahltan River weir was 347 large fish and 1,069 nonlarge Chinook salmon. This escapement of large Chinook
salmon in the Little Tahltan River was below the average and well below the lower end of the Canadian escapement target range of 2,700 to 5,300 large fish. This was the fourteenth consecutive year that the Canadian escapement target range was not reached.

The Little Tahltan River weir count represented approximately $3.6 \%$ of the total Stikine River large Chinook salmon escapement which is below the average weir count contribution of $4.9 \%$. Note that this average has declined significantly over the projects history and has ranged from $1 \%$ to $34 \%$ of the estimated escapement.

Chinook Salmon aerial surveys did not occur in 2020 due to travel restrictions that were implemented as a result of the COVID-19 pandemic.

Stikine River Chinook DNA baseline collection did not occur in 2020 due to travel restrictions that were implemented as a result of the COVID-19 pandemic.

## Coho Salmon

The annual coho salmon aerial survey was conducted on November 3 under very poor viewing conditions as a result of rain events and flood conditions; a count was possible only at Porcupine Slough. The in season weekly CPUE of coho salmon from the lower Stikine River Canadian commercial fishery was below average in SW's 35-36 but slightly above average in SW 37.

## Sockeye Salmon Run Reconstruction

The postseason estimate of the terminal Stikine River sockeye salmon run was 37,584 fish. Of this, approximately 26,458 fish were of Tahltan Lake origin (wild \& enhanced) and 11,125 fish were of mainstem origin. These estimates are based on postseason data, including otolith recovery and GSI analysis in the U.S. Districts 106 and 108 harvests, harvest data from the inriver Canadian commercial, Aboriginal, and test fisheries, and escapement data. Inriver stock composition data are from inseason egg diameter and inseason and postseason otolith analysis. The 2020 terminal run was well below average and well below the preseason forecast of 103,000 fish.

Forest fire activity in the Stikine River drainage impacted sockeye salmon monitoring projects in 2018. As such, the escapement number for Tahltan Lake sockeye was partially estimated 2018 and will be finalized in 2020.

## TAKU RIVER

Taku River salmon are harvested by U.S. commercial drift gillnet and troll fisheries as well as recreational and inriver personal use fisheries in Alaskan District 111. In Canada, a commercial gillnet fishery extends from the international border upstream for approximately 18 km , with Aboriginal and recreational fisheries also harvesting Taku River salmon (Figure 2).

Figure 2. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Sharing and Joint Management Models

Fishing arrangements in place for salmon originating from the Canadian portion of the Taku River watershed are provided in Annex IV, Chapter 1 of the PST and can be found at: https://www.psc.org/publications/pacific-salmon-treaty/. These arrangements include directed fisheries and harvest shares based on run size for Taku River Chinook salmon and coho salmon stocks and directed fisheries for sockeye salmon with harvest sharing arrangements based on the documented production of enhanced fish.

The TTC met prior to the season to update joint management and enhancement plans, develop run size forecasts, and determine new parameters for input into the inseason Chinook, sockeye, and coho salmon run size projection models.

## Chinook Salmon

The bilateral Taku River large Chinook salmon escapement goal range of 19,000 to 36,000 fish with a management objective of 25,500 fish was developed in 2009.

Weekly Chinook salmon run size and AC projections based on historical run timing are used to guide the management of U.S. and Canada fisheries. These are determined by a formula based on the preseason Taku River large Chinook salmon run forecast early in the season, and revised inseason based on the inseason run projection estimates generated from the MR project.

Table 4. Taku River large Chinook salmon run size based on CPUE (methods similar to the Stikine Chinook Management Model), and other methods, and weekly inseason harvest estimates from the District 111 drift gillnet, sport, troll, and personal use fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2020.

|  | Terminal Run |  |
| :---: | :---: | :---: |
| SW | Estimate | SW |
| 19 | 12,400 | 19 |
| 20 | 12,400 | 20 |
| 21 | $<19,000$ | 21 |
| 22 | $<19,000$ | 22 |
| 23 | $<19,000$ | 23 |
| 24 | $<19,000$ | 24 |
| 25 | $<19,000$ | 25 |
| 26 | $<19,000$ | 26 |
| 27 | $<19,000$ | 27 |
| 28 | $<19,000$ | 28 |
| 29 | $<19,000$ | 29 |

The 2020 preseason terminal run forecast of 12,400 Taku River large Chinook salmon provided no AC for directed fisheries for either country. The Taku River Chinook salmon forecast model was reduced to account for model error over the past five years. An
additional consideration for reducing the model forecast was the general poor performance of Chinook salmon stocks in recent years throughout northern British Columbia and Alaska. The 2020 forecast is one of the lowest on record, and below the average terminal run size of 19,400 fish.

No Chinook salmon inriver assessment fishery was conducted because of the low preseason forecast, however a drifted tangle net was used near the confluence of the Wright River to spaghetti and radio tag fish to allow for a spawning grounds MR estimate, potentially give some sense of inseason run abundance based on catch rates, and to determine tagged fish dropout rate. Traditional inseason MR estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were unavailable due to low catch rates during the first event and no Chinook salmon retention permitted in directed commercial fisheries (second event). With no reliable way of estimating inseason run size, both countries managed their early season sockeye salmon fisheries based off the preseason Chinook salmon forecast.

## Sockeye Salmon

Taku River sockeye salmon have a 2020 revised escapement goal range of 40,000 to 75,000 fish with a management objective of 58,000 fish based on revised historical run sizes resulting from the Transboundary Panel's review of Taku River sockeye salmon assessment.

Sockeye salmon weekly inriver abundance estimates are generated from the joint MR program using the Canyon Island fish wheels as event 1 and the Canadian inriver fishery as event 2 . The weekly inriver run estimate is combined with historical fish wheel migratory timing and fishery harvest data to project the Taku River sockeye salmon terminal run size and TAC. An adjustment for tagged fish dropout and size selectivity was applied inseason. Otolith analysis of the U.S. and Canadian harvests are used to project the enhanced component of the run which determines the Parties ACs.

The 2020 preseason terminal run forecast of 139,000 Taku River wild sockeye salmon was below the recent average of 144,200 fish. This was a stock-recruitment model forecast that was adjusted using the recent five-year model error (6\%). Note that this forecast was based on revised historical run sizes resulting from the Transboundary Panel's review of Taku River sockeye salmon assessment.

Approximately 10,000 enhanced fish from Tatsamenie Lake were forecasted, above the average Tatsamenie enhanced run size of 9,000 fish. Based on the treaty arrangement, an enhanced run of 5,000-15,000 fish requires the TAC to be split $77 \%$ to the U.S and $23 \%$ to Canada with management based on weekly estimates of the TAC of wild fish. The 2020 management objective of 58,000 wild sockeye salmon compared to the 2020 forecast of 139,000 wild sockeye salmon, resulted in a preseason TAC of 81,000 fish; $77 \%$ or 62,400 fish to the U.S., and $23 \%$ or 18,600 fish to Canada.

## Coho Salmon

In early 2015, an escapement goal range of 50,000 to 90,000 Taku River coho salmon with a 70,000 fish management objective was adopted. The management intent for both Parties in 2020 was to manage their fisheries to achieve the respective ACs based on harvest sharing dictated by Paragraph 3(b)(iii) of Annex IV, Chapter 1 of the PST.

Inseason run estimates are generated using MR methodology. Tags are applied in event 1 from Canyon Island fish wheels or set gillnets. Event 2 consists of fish inspected in the inriver commercial or assessment fisheries upstream of the U.S./Canada border. Weekly
inriver run abundance estimates are projected to terminal run estimates based on average run timing past Canyon Island. A tagged fish dropout rate for Taku River coho salmon is under development and is not incorporated into estimates at this time.

The 2020 preseason terminal run forecast of 122,000 Taku River coho salmon was above the average terminal run of 111,000 fish. The 2020 forecast was generated using the relationship between the CPUE in smolt tagging and the total run estimates seen since 1997.

## U.S. Fisheries

The traditional District 111 commercial drift gillnet salmon fishery was open for a total of 33 days from June 21 through September 14, 2020. The harvest totaled 1,094 Chinook, 28,233 sockeye, 15,863 coho, 65,353 pink, and 109,516 chum salmon. Harvests of all species were significantly below average. The traditional fishery does not include harvests from the Speel Arm Special Harvest Area (SHA) inside Port Snettisham. This hatchery access area did not open in 2020 due to low returns of Speel Lake and Snettisham Hatchery sockeye salmon.

The 2020 season was the twenty-first year of adult sockeye salmon returns to the Snettisham Hatchery inside Port Snettisham. These fish contributed to the traditional harvests in Taku Inlet, Stephens Passage, and the entrance of Port Snettisham, the latter only being open from SWs 36 through 38. This was the sixth year of full production for DIPAC's revitalized enhanced coho salmon program and the proportion of these fish in the traditional District 111 gillnet coho salmon harvest was significant. Hatchery stocks contributed substantially to the harvests of sockeye, coho, and chum salmon and more minimally to the harvest of Chinook salmon.

In 2018, the Alaska Board of Fisheries adopted a regulation increasing the sockeye salmon possession and annual limits for the U.S. Taku River personal use fishery to 10 fish for a household of one person and 20 fish for a household of two or more persons. The estimated personal use harvest of Taku River sockeye salmon in 2020 is 1,131 fish.

Management actions in the District 111 commercial drift gillnet fishery due to Chinook salmon conservation concerns occurred in the first four directed sockeye salmon openings with two-day openings in Taku Inlet in SWs 26 through 28, significant area closures including most of Taku Inlet and waters extending further south and west in SW 26, a closure north of Point Cooper in SW 27, and north of the latitude of Jaw Point in SWs 28 and 29. A six-inch maximum mesh size restriction was in place throughout the district in SWs 26 through 28. Night closures ( 10 p.m. to 4 a.m.) were in place throughout the district in SWs 26 and 27. Commercial spring troll fisheries throughout the region were limited to select outer coastal areas, near hatchery facilities/release sites, in THAs, and in areas that have been identified as having low proportional harvest of wild SEAK/Yakutat Chinook salmon. Nonretention of Chinook salmon in the sport fishery was in effect in northern inside waters from April 1 through June 14. The personal use sockeye salmon fishery on the U.S. side of the Taku River was also delayed by nearly two weeks starting on July 13. The 2020 District 111 drift gillnet Chinook salmon harvest in the SWs 25-29 TBR accounting period was 928 fish of which $57 \%$ were large fish. Postseason GSI analysis indicates that $35.5 \%$ of the District 111 drift gillnet large Chinook salmon harvest (189 fish) was of Taku River origin through SW 29. The Juneau area sport harvest of Taku River large Chinook salmon was estimated at 117 fish during the same period based on GSI analysis. The MR estimate of Taku River spawning escapement is approximately 15,590 large Chinook salmon.

The traditional District 111 sockeye salmon harvest of 28,233 fish was $28 \%$ of average with generally well below average weekly CPUE throughout the sockeye management
period. Snettisham Hatchery sockeye salmon returns began to contribute to the traditional fishery in SW 28 and otolith sampling occurred through SW 35 in Taku Inlet and Stephens Passage. The District 111 sockeye salmon harvest distribution was $53 \%$ in and around Taku Inlet (average is $70 \%$ ) and $47 \%$ in Stephens Passage south of Circle Point (average is $22 \%$ ). The contributions of Taku River wild, Taku River enhanced, Port Snettisham enhanced, and other sockeye salmon stocks were derived from estimates based inseason on otolith analysis and postseason from estimates based on GSI and otolith analyses. The postseason GSI based stock composition of the harvest of sockeye salmon in the traditional District 111 (with the exception of the entrance to Port Snettisham, stat area 111-34, which does not get adequately sampled) drift gillnet fishery is 8,099 (29\%) Taku River wild, 243 ( $0.9 \%$ ) enhanced Tatsamenie and Little Trapper lakes, 15,849 (56\%) Snettisham Hatchery fish, and 3,902 (14\%) domestic (other) wild fish.

Opportunity to target returning Snettisham Hatchery sockeye salmon inside Port Snettisham did not occur this season and the entrance to Port Snettisham was only opened late in the season to allow some targeting of Port Snettisham coho salmon stocks. The Speel Lake weir was not put in place this season due to staffing issues during the COVID-19 health emergency, so accurate enumeration of fish passing into Speel Lake was not possible although stream counts were conducted by DIPAC staff generally every three days. The minimum mesh size restriction south of Circle Point was not put in place this season with a small fleet size and very little chance for a fishery to occur inside the Speel Arm SHA.

Coho salmon stocks harvested in District 111 include returns to Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams, as well as Alaskan hatchery release sites. The 2020 preseason terminal run forecast of 122,000 Taku River coho salmon was above the average terminal run of 111,000 fish. The traditional District 111 coho salmon harvest of 15,863 fish was $45 \%$ of average and was comprised of a large proportion of hatchery fish. Hatchery coho salmon, mainly returning to DIPAC release sites in Gastineau Channel, first appeared in the District 111 harvest in SW 33 and made up as much as $68 \%$ of the weekly harvest in SW 38. CWT analyses indicate hatchery coho salmon contributed approximately 4,100 fish or $26 \%$ of the 2020 District 111 drift gillnet harvest.

Management of the District 111 drift gillnet fishery is based on Taku River wild sockeye salmon abundance in SWs 25-33 and on Taku River wild coho salmon abundance in SWs 34-42. The 2020 fishery began by regulation in SW 26. Management actions were limited to imposing restrictions in time, area, and gear. Because there is no bilaterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fish wheel catches. As the fishing season progresses, sufficient data is acquired to estimate the inriver run size from the inriver MR program and to use that estimate in conjunction with historical migratory timing and fishery harvest data to project the season's Taku River sockeye salmon terminal run size. In the first week of sockeye salmon management starting June 21, Taku Inlet and Stephens Passage were opened with restrictions in time, area, and gear due to Chinook salmon conservation concerns. The opening was limited to two days with a six-inch
maximum mesh size restriction, night closures in effect from 10 p.m. to 4 a.m., and an area restriction closing waters in Taku Inlet north of Point Greely and west of a line of longitude running mid-inlet from the latitude of Point Greely to a point where it intersects with the Admiralty Island shoreline south of Grand Island. Effort was approximately $49 \%$ of average for the week with 23 boats fishing. Sockeye salmon harvest was $8 \%$, and CPUE was $22 \%$ of average. Total Chinook salmon harvest was 268 fish with 63 fish estimated as Taku River origin large fish based on inseason CWT analysis and ASL sampling.

District 111 was again opened for two days in SW 27 with the northern line shifted to the latitude of Point Cooper in Taku Inlet and the same gear and time restrictions throughout the district as the previous opening to minimize Chinook salmon interception. Two days of fishing in the district was approximately $71 \%$ of average for the week. Thirty-three boats, $47 \%$ of average, harvested 284 Chinook salmon of which an estimated 59 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. Sockeye salmon harvest and CPUE were $20 \%$ and $58 \%$ of average.

District 111 was again opened for two days in SW 28 with no additional time granted. Chinook salmon conservation measures were again reduced this week with open waters extended north to the latitude of Jaw Point in Taku Inlet. The maximum mesh size restriction remained in place while night closures were no longer utilized. The two days fishing was open in the district was $69 \%$ of average. Effort increased from the previous week to 42 boats, $41 \%$ of average. One hundred eighty-four Chinook salmon were harvested this week, of which an estimated 96 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. Sockeye salmon harvest and CPUE decreased from the previous week to $7 \%$ and $27 \%$ of average. Otolith analysis revealed that $5 \%$ of the sockeye salmon harvest from Taku Inlet were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tahltan Lake origin made up 1\% of the Taku Inlet harvest. A Taku River sockeye salmon run size estimate was produced this week, although the degree of uncertainty was high. The BTSPAS model projected an inriver run of 156,900 fish.

Taku Inlet and Stephens Passage were opened for three days in SW 29 and were then extended for an additional day for a total of four days based on a small fleet size, increased sockeye salmon CPUE, and a significant inriver run size projection. The maximum mesh size restriction was rescinded for this opening, but the northern line remained at the latitude of Jaw Point for Chinook salmon conservation. An unprecedented area closure west of Point Bishop was put in place this week to increase passage of DIPAC chum salmon into Gastineau Channel due to concerns with achieving broodstock goals. A six-inch minimum mesh size restriction would typically be implemented south of Circle Point in Stephens Passage to minimize harvest of Port Snettisham wild sockeye salmon returns while still allowing opportunity to target enhanced chum salmon, however, this restriction was not utilized throughout the season. Four days of fishing was $133 \%$ of average for the week and the only opening during the sockeye management period (SWs 26-33) with above average time. Sixty-two boats, $53 \%$ of average, harvested 192 Chinook salmon, of which an estimated 52 fish were Taku River large fish based on inseason CWT analysis and ASL sampling. Sockeye salmon harvest and CPUE increased from the previous week to 43\% and $58 \%$ of their respective averages. Otolith analysis revealed that $44 \%$ of the sockeye
salmon harvest from Taku Inlet, and $66 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Trapper, Tatsamenie, and Tahltan lakes origin made up less than $1 \%$ of the harvests in Taku Inlet and Stephens Passage. The second Taku River sockeye salmon run size estimate was produced this week and projected an inriver run of 164,100 fish.

Fishing time for SW 30 was set at three days in both Taku Inlet and Stephens Passage with the northern line in Taku Inlet relaxed to the full extent while the Point Bishop area closure remained in place to conserve DIPAC chum salmon for broodstock needs. No time extension was given this week with poor Taku Inlet sockeye salmon CPUE and increased opportunity on Port Snettisham sockeye salmon without a minimum mesh size restriction in place. Effort increased from the previous week to the highest level of the season with 92 boats making landings, $80 \%$ of average. The sockeye salmon weekly harvest of 10,200 fish was the highest of the season and was $52 \%$ of average ( $38 \%$ in Taku Inlet and $101 \%$ in Stephens Passage) while CPUE was $69 \%$ of average ( $47 \%$ in Taku Inlet and $128 \%$ in Stephens Passage). Otolith analysis revealed that $50 \%$ of the sockeye salmon harvest from Taku Inlet, and 59\% from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie and Tahltan lakes origin made up $3 \%$ of the harvest in Taku Inlet, and Tatsamenie Lake enhanced fish made up less than $1 \%$ of the harvest in Stephens Passage. The weekly Taku River sockeye salmon inriver run size projection decreased from the previous week to 147,600 fish.

Fishing time for SW 31 was reduced to two days in both Taku Inlet and Stephens Passage with no time extension. The Point Bishop area closure remained in place and this was the last opening in which it was utilized. The two-day opening was $53 \%$ of average for the week and the first time since the 2010 season that fishing time was held to two days throughout the district for this week. Effort decreased significantly from the previous week to 55 boats, $55 \%$ of average for the week. Sockeye salmon harvest was $29 \%$ of average ( $13 \%$ in Taku Inlet) while CPUE was $96 \%$ of average ( $45 \%$ in Taku Inlet). Otolith analysis revealed that $54 \%$ of the sockeye salmon harvested in Taku Inlet, and $78 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie and Tahltan lakes origin made up $3 \%$ of the harvest in Taku Inlet, and Tatsamenie Lake enhanced fish made up less than $1 \%$ of the harvest in Stephens Passage. The weekly Taku River sockeye salmon inriver run size projection again decreased from the previous week to 125,200 fish.

Fishing time for SW 32 was again set at two days in Taku Inlet and Stephens Passage with no time extension. The two-day opening was $53 \%$ of average for the week and the first time since the 2000 season that fishing time was held to two days throughout the district for this week. The 53 boats fishing was similar effort to the previous week and $73 \%$ of average. Sockeye salmon harvest and CPUE were $13 \%$ and $33 \%$ of their respective averages. Otolith analysis revealed that $71 \%$ of the sockeye salmon harvested in Taku Inlet, and $91 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up less than $1 \%$ of the harvest in Taku Inlet. The weekly Taku River sockeye salmon inriver run size projection increased from the previous week to 134,500 fish.

Fishing time for SW 33 was again initially two days in Taku Inlet and Stephens Passage. A one-day extension was utilized based primarily on a small fleet size and severe marine weather on the first day of the opening keeping most boats off the water. Three total days of fishing was $86 \%$ of average for the week. Effort fell drastically from the previous week to 20 boats, $31 \%$ of average which was the lowest proportion of the season. Sockeye salmon harvest and CPUE were $13 \%$ and $52 \%$ of their respective averages. Otolith analysis indicated that $79 \%$ of the sockeye salmon harvest from Taku Inlet, and $92 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up less than $1 \%$ of the harvest in Taku Inlet. The weekly Taku River sockeye salmon inriver run size projection fell from the previous week to 116,100 fish, and this was the last bilateral estimate of the season. The current escapement estimate, with approximately $84 \%$ of the run through the Canyon Island fish wheels, was 87,500 sockeye salmon. This is well above the upper end of the escapement goal range of 75,000 fish and the average escapement of 70,000 fish, quite confounding when considering the District 111 and inriver fishery had some of the lowest weekly harvests and catch rates ever observed. This was the last week of the sockeye salmon management period in District 111 with coho salmon management starting in SW 34. The first Taku River coho salmon inriver run estimate was produced this week and expanded by average run timing with harvest from fisheries applied, projected a terminal run of 40,000 fish.

The fall commercial drift gillnet season in District 111 occurred over five weeks, beginning on August 17 in SW 34, and ending on September 14 in SW 38. During this time, management in District 111 switched from being driven by Taku River sockeye to coho salmon abundance. The Taku River coho salmon terminal run size forecast of 122,000 fish gave some optimism for runs developing contrary to inseason run size estimates coming in well below the management objective of 70,000 fish. Inriver abundance did not develop, and time and area were restricted throughout the season in Taku Inlet which closed in SW 38 after two consecutive one-day openings.

Fishing time for SW 34 was set for three days in Taku Inlet and Stephens Passage. The fishery was delayed until Monday this week to avoid conflict with the annual Golden North Salmon Derby. Relatively few coho salmon were caught in the sport fishing derby and this lack of fish was also observed in the District 111 opening. A well below average 25 boats made landings in the fishery for the week. Otolith sampling indicated that $88 \%$ of the sockeye salmon harvest from Stephens Passage was of Snettisham Hatchery origin. The coho salmon harvest and CPUE were $68 \%$ and $110 \%$ of average. CWT analysis indicated that $22 \%$ of the coho salmon harvest for the week was comprised of Alaska hatchery fish. The coho salmon hatchery contribution in the District 111 gillnet harvest this season was once again comprised nearly entirely of DIPAC fish returning to Gastineau Channel. The second Taku River coho salmon inriver run estimate, expanded by average run timing with harvest applied, projected a terminal run of 46,000 fish, a slight increase from the previous week but still below the lower bound of the escapement goal range.

Fishing time for SW 35 was set at two days throughout the district with a one-day extension utilized in Stephens Passage due to increased and consistent coho salmon catch rates there.

A total of 33 boats made landings throughout the opening, $83 \%$ of average, with effort in Stephens Passage over twice the average. Otolith sampling indicated that $51 \%$ of the sockeye salmon harvest from Taku Inlet, and $87 \%$ from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin made up $2 \%$ of the harvest in Taku Inlet. This was the last week of otolith sampling in District 111. Coho salmon harvest and CPUE were $75 \%$ and $90 \%$ of average, buoyed by performance in Stephens Passage. CWT analysis indicated that $17 \%$ of the coho salmon harvest for the week was comprised of Alaska hatchery fish. The projected terminal run estimate for Taku River coho salmon decreased slightly from the previous week to 45,000 fish.

Fishing time for SW 36 was initially set at two days in Taku Inlet and three days in Stephens Passage with the entrance of Port Snettisham opened for the first time this season. An extension of one additional day occurred throughout the district due to severe marine weather on the first day of the opening and a small fleet size. A total of 22 boats, $60 \%$ of average, made landings with coho salmon harvest and CPUE at $65 \%$ and $97 \%$ of average. The 4,150 coho salmon harvested this week represented the largest weekly harvest of the season. CWT analysis indicated that $10 \%$ of the coho salmon harvest for the week was comprised of Alaska hatchery fish. The weekly projected terminal run estimate for Taku River coho salmon increased slightly from the previous week to 52,000 fish, just over the lower bound of the escapement goal range.

Fishing time for SW 37 was set at one day in Taku Inlet and two days in Stephens Passage with no time extension. The fourth inseason Taku River coho salmon run size projection, which informed this opening, has differed from the final postseason estimate by $10 \%$ on average in the past five seasons and the one day opening in Taku Inlet signaled a potential end to the season. Effort increased slightly from the previous week to 25 boats, $78 \%$ of average. Coho salmon harvest was $54 \%$ of average while CPUE was $136 \%$ of average. DIPAC coho salmon contributed significantly to the fishery for the first time this season resulting in higher Taku Inlet CPUE. CWT analysis indicated that $66 \%$ of the coho salmon harvest was comprised of Alaska hatchery fish. The weekly Taku River coho salmon terminal run projection increased slightly from the previous week to 55,000 fish.

Fishing time for SW 38 was set at one day throughout the district with an additional area restriction added in Taku Inlet closing waters north of Point Cooper. Effort decreased to 13 boats fishing which was half of average. Coho salmon harvest was $22 \%$ of average while CPUE was $148 \%$ of average. CWT analysis indicated that Alaska hatchery fish contributed $68 \%$ to the weekly coho salmon harvest. The weekly Taku River coho salmon terminal run projection increased from the previous week to 62,500 fish, below the management objective of 70,000 fish where the U.S. begins to accumulate AC. This was the final opening in a season full of weak openings and District 111 closed for the season at noon on Monday, September 14.

The 2020 District 111 fall chum salmon harvest in SWs $34-38$ was $21 \%$ of the fall fishing period average, with the latter part of the season significantly truncated. Escapement numbers for Taku River chum salmon are unknown; however, the number of chum salmon
caught by the fish wheels throughout the season at Canyon Island can be used as an index of escapement. The 2020 fish wheel catch of 44 chum salmon (Fish Wheel 1 and 2 only) was $27 \%$ of average. Comparisons to historical data are not as straightforward for the 2018 through 2020 seasons, the fish wheel operation times were altered significantly in efforts to reduce holding time of fish in the live boxes. This resulted in the fish wheels not spinning 24 hours a day as they had in the past. However, chum salmon returning to the Taku River were obviously at lower than average abundance.

The District 111 traditional drift gillnet pink salmon harvest of approximately 65,000 fish was $44 \%$ of average. Escapement numbers for Taku River pink salmon are unknown; however, the number of pink salmon caught by the fish wheels at Canyon Island can be used as an index of escapement. The 2020 total of 4,739 pink salmon caught in the fish wheels (Fish Wheel 1 and 2 only) was $295 \%$ of the 2018 parent-year catch and $71 \%$ of the 2000-2018 even-year average. The pink salmon escapement to the Taku River is characterized as near average with the same caveats in comparing Canyon Island fish wheel catches in recent seasons to historical catches as mentioned in the chum salmon section.

Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2020. Several Chinook salmon stocks are known to contribute to the Juneau area sport fishery, including wild fish from the Chilkat River, as well as hatchery stocks, but the major contributor of large, wild fish is the Taku River. Of the Chinook salmon harvested in the sport fishery, 117 fish were estimated to be of Taku River origin through SW 29 based on postseason GSI analysis. Personal use permits were used to harvest an estimated 1,131 Taku River sockeye salmon along with an estimated incidental harvest of 17 Taku River large Chinook salmon. The District 111 Amalga Harbor SHA common property purse seine fishery targeting returning DIPAC enhanced summer chum salmon, northwest of Juneau, did not occur this summer as all the returns here were needed for cost recovery purposes. Some portion of the incidental sockeye salmon harvest from these fisheries, when they occur, is assumed to be of Taku River origin, but the magnitude of the contribution is unknown. GSI analysis of the 2013 and 2014 harvests averaged 35\% Taku River origin.

## Canadian Fisheries

The Taku River commercial fishery harvest was 11,556 sockeye and 6,970 coho salmon in 2020. No Chinook salmon were retained. Sockeye salmon originating from Taku fry plants contributed an estimated 332 fish to the harvest, comprising $2.9 \%$ of the total commercial sockeye salmon harvest. As a result of a poor preseason run forecast and lack of inseason information, there was no directed commercial Chinook salmon fishery in 2020 and all incidental catches in commercial fisheries were released. In addition, the Chinook salmon assessment fishery did not occur in 2020. Harvests of sockeye and coho salmon were below average. There were 40 days of fishing which was below average. The seasonal fishing effort of 255 licence days was below average. As is typical, both set and drift gillnets were used, with the majority of the harvest taken in drift gillnets. The maximum allowable mesh size was 14.0 cm ( 5.5 inches) for the early part of the season to minimize the incidental catch of Chinook salmon. This was subsequently increased to 20.4 cm ( 8.0 inches).

In addition to the commercial fishery harvest, 11 nonlarge Chinook, 94 large Chinook, 237 sockeye, and 66 coho salmon were harvested in the Aboriginal fishery. On average, 81 large Chinook, 13 nonlarge Chinook, 132 sockeye and 116 coho salmon are harvested annually in the Aboriginal fishery.

As a result of the preseason forecast being well below the goal range, retention of Chinook salmon of any size was not permitted in the recreational fishery effective April 1, 2020. Complete recreational harvest figures are not available but the harvests of other salmon species are thought to have been negligible.

Typically, the inseason management of Taku River Chinook salmon depends on abundance estimates generated from the joint MR program in the lower Taku River with tags being applied below the border and recoveries being made in the Canadian assessment and/or commercial fisheries. In recent years, when the preseason forecast or inseason projections have indicated no AC, the commercial fishery has operated in an assessment mode and served as the test fishery identified in the PST agreement. In 2020, as in the previous three years, the preseason forecast did not warrant an assessment fishery and the Panel did not recommend it as a result. As such, the preseason forecast was used to make necessary adjustments in the other fisheries with the intention of eliminating the harvest of Chinook salmon.

Due to the poor large Chinook salmon forecast (coupled with ongoing Kuthai Lake sockeye salmon concerns), the start of the directed commercial fishery for sockeye salmon was delayed by 16 days. The first opening was noon Tuesday, June 30 (SW27) and this was held to a maximum of 48 hours. Additional measures were also implemented based on Chinook salmon considerations. As per the 2020 Taku River commercial conditions of licence, the harvest of Chinook salmon was not permitted. In addition, the use of set nets was not permitted for the first commercial opening (SW27) to allow for the release of Chinook salmon. A maximum mesh size restriction of 140 mm (approximately 5.5 inches) was in effect midway through SW30 (ending July 25).

The preseason forecast of 139,000 wild Taku sockeye salmon with an enhanced run size forecast of 5,001-15,000 fish provided Canada with a $23 \%$ share of the TAC, with management based on weekly estimates of the TAC of wild fish. Subtracting the revised management objective of 58,000 wild sockeye salmon from the forecast resulted in an overall preseason TAC of 81,000 fish; $23 \%$ of that was approximately 18,600 fish. In addition to its share of the TAC, Canada was able to harvest any fish in excess of the management objective and broodstock needs apportioned by run timing.

The preseason forecast for the total (wild plus enhanced) terminal run of Tatsamenie fish was well above the average of approximately 17,000 fish. The egg-take goal for the 2020 season was based on a target of $50 \%$ of the escapement up to a maximum of 3.0 million eggs. During SWs 31-33 (July 26-August 15), management attention focused on Tatsamenie sockeye salmon to ensure an adequate number of sockeye salmon escaped to Tatsamenie Lake to support wild production and egg-take objectives.

As in past years, guideline harvests were developed each week for both sockeye and coho salmon fisheries to guide management decisions so that: a) the catch was consistent with conservation and Treaty objectives; and b) management was responsive to changes in projections of abundance (i.e., abundance-based management).

Fishing periods were set with a view to achieving weekly guideline harvests. Extensions to weekly fishing periods were considered if it appeared that the weekly guidelines would not be achieved. For both drift and set gillnets, net length was restricted to a maximum of 36.6 m ( 120 ft .); mesh sizes were restricted to between 100 mm ( 4 inches) and 204 mm ( 8 inches) except for the period prior to August 1 (SW 31) when the maximum permissible was 140 mm ( 5.5 inches) to reduce the bycatch of Chinook salmon.

The following summarizes the fishery management on a weekly basis and generally captures catch estimates and stock assessment information made inseason. As such the catch figures may not match the values listed in appendix tables. This is due to slight changes resulting from postseason review of catch slips, and updated stock composition information. Sockeye salmon catches and run projections are for wild fish; CPUE data is for wild and enhanced fish combined. Guideline harvests presented in Table 9 are based on run projections made the previous week; additionally, those identified in the verbiage were generally based on the previous week's run projection. Values in Table 9 may differ from what is presented in appendix tables as they reflect inseason information. Guidelines identified in Table. 9 were set using a 23:77 harvest split for the entire sockeye salmon management period.

As per the preseason forecast, the weekly guideline for the first week of the fishery (SW 27) was approximately 1,400 wild fish. As noted, for conservation reasons, the opening occurred on a Tuesday rather than the standard Sunday; furthermore it was for a 24 -hour period rather than the more usual 48-hours. Increasing water levels and a minimal bycatch of Chinook salmon, an extension of 24 hours was provided. The two-day opening resulted in a catch of 569 sockeye salmon. A total of 82 large Chinook salmon were caught and subsequently released.

Table 9. Inseason run size projections, Canadian available harvest, and actual harvest of Taku River wild sockeye salmon, 2020.

| Stat <br> Week | Terminal Run | TAC | Inriver <br> Run | Cdn <br> Available Harvest | Weekly Guideline | Weekly Actual | Cum. Guideline | Cum. <br> Actual |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 24 | 153,520 | 94,520 |  | 18,904 | 494 | 0 | 494 | 0 |
| 25 | 153,520 | 94,520 |  | 18,904 | 868 | 0 | 1,362 | 0 |
| 26 | 153,520 | 94,520 |  | 18,904 | 1,119 | 0 | 2,481 | 0 |
| 27 | 153,520 | 94,520 |  | 18,904 | 1,378 | 585 | 3,859 | 585 |
| 28 | 153,520 | 94,520 |  | 18,904 | 1,927 | 1,435 | 5,785 | 2,020 |
| 29 | 96,534 | 37,534 | 84,784 | 25,784 | 3,041 | 2,437 | 10,932 | 4,457 |
| 30 | 130,955 | 71,955 | 84,984 | 25,984 | 4,031 | 4,290 | 15,048 | 8,747 |
| 31 | 177,351 | 118,351 | 120,580 | 61,580 | 8,567 | 5,796 | 44,229 | 14,543 |
| 32 | 176,509 | 117,509 | 114,657 | 55,657 | 6,817 | 2,222 | 46,791 | 16,765 |
| 33 | 163,485 | 104,485 | 111,961 | 52,961 | 3,241 | 2,630 | 47,766 | 19,395 |

Note: Run sizes reflect either the preseason forecast or the projection from the preceding week. Weekly guidelines are based on available harvest (inriver run less escapement target) apportioned by run timing.

The fishery opened on three days in statistical week 28 (July 5-11). The weekly guideline, still based on the preseason forecast, was 1,900 wild fish. Extreme water levels in the beginning of the week made for difficult fishing conditions. An additional 24 hours of fishing time was added in hopes that water levels would ease. The weekly harvest was 1,487 sockeye salmon. A total of 88 large Chinook salmon were released. The weekly inseason run projection was made after the close of the fishery. It projected an inriver run of 155,151 fish which was regarded with caution.

An opening of three days was posted for statistical week 29 (July 12-18). Although the inriver run projection of $\sim 155,000$ fish was considered to be high, when apportioned by run timing, the available harvest was 11,500 fish, using the management objective of 58,000 . Water levels were near average for the week. An additional two fishing days were added as harvests were projected to be well below the weekly guideline. The weekly harvest was 1,705 sockeye salmon. Weekly effort averaged 6.0 licences, which is considered to be below the average. The inriver run projection made after closing was 162,952 fish which was considered to be higher than expected and viewed accordingly.

The fishery in statistical week 30 (July 19-25) was opened on three days. The weekly guideline using the inriver run projection of $\sim 163,000$ was 16,000 fish. Taking into consideration for rising water levels and an apparent abundance of fish, the opening was extended for an additional 48-hours. The weekly harvest was 1,208 fish. The number of licenses that fished in SW 30 was 6.2 . After day three of the fishery, an inriver run projection of 141,281 fish which was well above preseason expectations.

For statistical week 31 (July 26-August 1), the weekly guideline was $\sim 12,000$ sockeye salmon based on the inriver run outlook from SW 30. The initial opening was three days; once again rising water levels made for difficult fishing conditions and in response to this an additional two day of fishing time was added. Licences fished for the week was 6.4
following the below average trend to date. The weekly harvest was 1,986 fish. The inriver run projection was 126,836 fish, below the SW 30 projection.

The fishery was again opened on three days in statistical week 32 (August 2-8). Based on an inriver run projection of 127,000 fish, the weekly guideline was 8,400 fish. Water levels climbed over the course of the opening and as a result, another 48-hours of fishing time were added. The weekly harvest was 2,524 sockeye salmon; the number of licenses fished was 6.8 which is below average. The inriver run projection made after closing, 132,061 sockeye salmon, was relatively consistent with the previous week.

Statistical week 33 (August 9-15) started with a weekly guideline harvest of $\sim 4,500$ fish and an opening of 3 days. The effort was 5.2 licences, which was comparatively below average. The fishery was extended for an additional 2 days to make up for time lost during a high water event. The weekly harvest was 1,130 sockeye salmon.

Statistical week 33 marked the end of the directed sockeye salmon fishery. The inriver run projection made at the end of statistical week 33 was 114,286 wild fish. The projected inriver run was 102,788 fish. Subtracting the actual harvest of wild fish to date ( $\sim 10,600$ fish) plus potential harvest in the coho fishery ( 1,000 fish) projected an escapement of approximately 102,000 wild sockeye salmon, which was above the escapement goal range of 40,000 to 75,000 fish.

The postseason harvest estimate of enhanced Taku River sockeye salmon was 332 fish which included fish from Trapper and Tatsamenie lakes. A small number of non-Taku enhanced-origin sockeye salmon were also harvested.

Postseason figures for the above are presented in the Sockeye Salmon Run Reconstruction section.

Based on the terminal run forecast of Taku River coho salmon in 2020 of 122,000 fish, a directed Canadian harvest was permitted starting in SW34. Canada was also permitted a directed harvest of all inriver coho salmon in excess of 75,000 fish (the sum of the MSY point goal of 70,000 fish and the 5,000 fish allocated for assessment purposes).

Statistical week 34 (August 16-22) was opened for three days based on the preseason forecast. Fishing conditions were poor, with water levels well above average for the week. A total of 641 coho salmon were landed plus 549 sockeye salmon.

Statistical week 35 (August 23-29) was opened for three days and extended for an additional 24 -hour period. Water levels were again well above average, and 3.3 licenses fished for the week. A total of 713 coho salmon and 233 sockeye salmon were harvested. The MR estimate after day three projected an inriver run of 40,276 fish well below preseason expectations.

Statistical week 36 (August 30 - September 5) was open for three days. Coho salmon catch rates continued to be poor. Water levels were well above average for the third week in a
row. Four licenses fished for the week which was below the average. A total of 848 coho salmon and 104 sockeye salmon were harvested. The inriver run projection at the close of the fishery was 44,539 fish which was an improvement over the previous estimate but well below the preseason forecast.

In light of the poor inseason run estimates, it was decided that Canada would fish SW37 39 (September 6-26) in assessment mode. Canada's remaining assessment allocation $(\sim 2,800)$ would be spread over the final three weeks to support the MR program.

A final inseason coho salmon run estimate was 59,099 fish. A total of 6,970 coho salmon were harvested in the commercial fishery and 66 coho salmon were harvest in the 66 Aboriginal fishery. Of the commercial harvest, 1,827 fish were from the directed sockeye fishery, i.e. prior to SW 34. Subtracting the total harvest of 7,036 fish indicated an escapement of 52,063 coho salmon. This is below the management objective of 70,000 fish and near the lower end of the escapement goal range of 50,000 to 90,000 fish.

## Escapement

## Sockeye Salmon

Spawning escapement is estimated by subtracting the inriver harvest from the above border run size estimate. The above border run size of sockeye salmon into the Canadian portion of the Taku River drainage is estimated from a joint Canada/U.S. MR program that has been operated annually since 1984. The size-stratified and current year dropout adjusted ( $17.3 \%$ ) postseason estimate of the above border run in 2020 is 112,677 fish; subtracting the inriver harvest of 11,780 Taku River fish (11,543 commercial and 237 Aboriginal fisheries harvest) as well as broodstock removals results in a naturally spawning escapement estimate of 99,508 total fish ( 98,391 wild fish). The Taku River naturally spawning escapement was above the naturally spawning escapement goal range of 40,000 to 75,000 fish.

Escapement projects conducted by Canada provide information on the abundance of discrete lake spawning stocks within the watershed. Traditional counting weirs were operated by DFO at Little Trapper and Tatsamenie lakes, and video counting weirs were operated by the TRTFN at Kuthai and King Salmon lakes.

The sockeye salmon escapement through the Kuthai Lake video weir was 4,131 fish in 2020; well above the average. Since 2016, TRTFN has been implementing small ongoing fish passage improvement projects on the Silver Salmon River, results will be available in a future report.

The King Salmon Lake sockeye salmon escapement through a video weir was 17,733 , the highest on record, well above the average. A planned TRTFN passage improvement project on an area of the King Salmon River that has posed passage issues in recent years was not conducted in 2020 due to logistical challenges.

The Little Trapper Lake traditional weir count of 7,670 sockeye salmon was average. Three hundred and forty-nine fish were removed for broodstock. Spawning escapement was 7,312 fish

The Tatsamenie Lake traditional weir count of 3,559 sockeye salmon was well below average. Based on thermal mark data $23 \%$ of the escapement was enhanced fish. There was a total of 1,053 fish removals which included 1,040 fish for broodstock, and 13 holding mortalities. An additional 123 fish were held for broodstock but released unspawned. Total spawning escapement was 2,506 fish.

## Chinook Salmon

Spawning escapement of Chinook salmon in the Canadian portion of the Taku River drainage was estimated from the joint Canada/U.S. MR program. Spaghetti and radio tag application took place from April 30 through July 2 using a drift gillnet to capture fish in the lower river near the Wright River just downstream of the U.S./Canada border. Fish wheels were also used from May 13 through October 3 to capture and spaghetti tag fish. Catches in the drift gillnet accounted for $77 \%$ of all tags applied to large Chinook salmon, though fish wheel catch comprised $44 \%$ of the total tags applied to all sizes of fish. There was no inseason event 2 component in 2020 since no assessment fishery or directed fishing for Chinook salmon was permitted due to the low preseason forecast. Also, Chinook salmon were required to be released in the inriver commercial sockeye fishery because of low abundance. Spawning ground sampling and spaghetti tag recovery occurred in July through September on the Nakina, Tatsatua, Kowatua, Nahlin, and Dudidontu rivers, as well as Tseta Creek. The sonar weir on the lower Nahlin River was operated from May 29July 31 with a minimum count of 2,451 extrapolated to an Aug 14 estimated end of run count of 2,518 .

The 2020 postseason Chinook salmon escapement estimate of 15,593 large fish was generated from the joint Canada/U.S. MR program with the lower river drift gillnet and fish wheels as event 1 . Tags out in event 1 were reduced based on the dropout rate ( $13.1 \%$ ) observed from the 2020 Chinook salmon telemetry project. Event 2 recapture combined the relevant spawning ground samples (Nakina, Tatsatua, Kowatua, Nahlin, and Dudidontu rivers, and Tseta Creek). This estimate is below the average escapement and the escapement goal range of 19,000 to 36,000 large Chinook salmon.

Peak aerial survey counts of large Chinook salmon to the five escapement index areas were Nakina 1,249 fish; Kowatua 505 fish; Tatsamenie 390 fish; Dudidontu 292 fish; and Nahlin 213 fish; Kowatua and Nakina were slightly above their historical averages and all other sites were below the historical average. Viewing conditions were excellent with clear water for most surveys. The total peak count of 2,649 large Chinook salmon expands to 13,775 large fish using the published expansion factor of 5.2.

## Coho Salmon

Spawning escapement of coho salmon in the Canadian portion of the Taku River drainage was estimated from the joint Canada/U.S. MR program. Tag application occurred at the CYI fish wheels from July 12 (SW 29) until October 3 (SW 40), augmented by gillnetting from September 17 to October 2. The tag recovery effort consisted of Canadian commercial/assessment fisheries which operated until September 22 (SW 39). No additional live release assessment fisheries occurred, so the final inseason estimate from SW 39 was expanded using coho salmon run timing at the CYI fish wheels.

The postseason inriver MR estimate is 59,099 fish. Considering the Aboriginal, commercial, and assessment fisheries Canadian inriver harvest of 7,036 fish the postseason spawning escapement estimate is 52,063 fish. This is well below the average escapement, but within the biological escapement goal range of 50,000-90,000 fish.

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels were used as an index of escapement. A total of 4,739 pink salmon were captured in 2020. This is above the recent even-year average.

## Chum Salmon

Chum salmon escapement numbers to the Taku River are unknown; however, the numbers of fall chum salmon captured by the fish wheels at Canyon Island were used as an index of escapement. A total of 44 chum salmon were captured in 2020; below average.

## Sockeye Salmon Run Reconstruction

An estimated 8,099 wild and 242 enhanced Taku River sockeye salmon were harvested in the U.S. District 111 drift gillnet fishery. This estimate was made by postseason GSI and otolith analysis. The estimated total U.S. harvest of Taku River sockeye salmon is 9,196 wild and 276 enhanced fish (Table 4).

In the Canadian commercial fishery, the postseason harvest estimate of Taku River sockeye salmon is 11,144 wild, 332 enhanced Tatsamenie Lake, and 66 enhanced Little Trapper Lake fish; total Canadian commercial harvest was 11,556 fish (11,543 Taku fish and 13 Stikine River enhanced fish, 0 U.S. domestic enhanced fish). An estimated 229 wild and 8 enhanced sockeye salmon were taken in the Canadian Aboriginal fishery. Therefore, the estimated Canadian treaty harvest of Taku River sockeye salmon is 11,373 wild and 407 enhanced fish (Table 4).

The postseason above border run size estimate of sockeye salmon is 112,677 fish estimated from the joint Canada/U.S. MR program. Deducting the Canadian inriver harvest and broodstock removals results in an estimated naturally spawning escapement of 99,508 fish; 98,392 wild fish. The Taku River enhanced sockeye salmon escapement estimate was

1,117 fish, which was estimated from broodstock otoliths collected at Tatsamenie and Little Trapper lakes. The Taku River sockeye salmon terminal run estimate is 120,092 wild fish and 2,057 enhanced fish. Based on the management objective of 58,000 wild fish, the wild TAC was 62,092 fish and combining wild and enhanced terminal run the TAC was 64,149 fish. The harvest sharing agreement based on total terminal enhanced run was $80 \%$ U.S. and $20 \%$ Canada.

#### Abstract

ALSEK RIVER Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 3). Unknown quantities of Alsek River origin fish may also be taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although Aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 3).

## Harvest Regulations \& Management Objectives

Although harvest sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV does call for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook and sockeye salmon. In February 2013, the bilateral TTC and bilateral TBR Panel agreed to the revised biological MSY based escapement goals for Alsek River Chinook and sockeye salmon. These were Alsek River Chinook salmon management objective of 4,700 fish (escapement goal range 3,500-5,300 fish), Klukshu River Chinook salmon management objective of 1,000 fish (escapement goal range of $800-1,200$ fish), Alsek River sockeye salmon management objective of 29,700 fish (escapement goal range of 24,000-33,500 fish), and Klukshu River sockeye salmon management objective of 9,700 fish (escapement goal range 7,500-11,000 fish). Since 1976 the principal escapement monitoring tool for Chinook and sockeye salmon stocks on the Alsek River is the Klukshu River salmon counts, a project operated by DFO in cooperation with the CAFN. MR programs to estimate the total inriver abundance and the portion of escapement contributed by Klukshu stocks operated from 1997 to 2005 for Chinook salmon, and from 2000 to 2005 for sockeye salmon. Currently, total Alsek River run estimates for sockeye salmon are generated using Dry Bay commercial sample GSI analysis to expand the Klukshu River counts.

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas.

## Preseason Forecasts

The preseason forecast for Klukshu River Chinook salmon escapement in 2020 was 1,200 fish. This forecast was below the average of approximately 1,500 fish and at the top of the escapement goal range of $800-1,200$ Chinook salmon. Two models were used in forecasting; a sibling model ( 1,150 fish) and a stock recruit model ( 1,170 fish). The sibling model uses 2019 returns of age 4 (BY 2015) and age 5 (BY 2014) Chinook salmon to predict the returns of age 5 (BY 2015) and age 6 (BY 2014) in 2020 using the relationships observed between age classes over the past 10-years corrected with the 5-year (2015-2019) average model error. The stock recruit model forecast is based on 24 -years of Klukshu

Chinook salmon production data and was discounted using the 5-year (2015-2019) average model error (51\%).

The 2020 Alsek River sockeye salmon run was expected to be approximately 65,000 fish; this was slightly below the average run size estimate of approximately 72,000 sockeye salmon. The outlook for 2020 was based on a predicted run of 15,000 Klukshu River sockeye salmon, near the average of approximately 16,000 fish, and above the upper end of the Klukshu River escapement goal of 7,500 to 11,000 sockeye salmon. The forecast was derived from the latest Klukshu River stock-recruitment relationship and based on MR results (2000-2004) and run size estimates using GSI $(2005-2006,2011)$ which indicate a Klukshu River contribution to the total run of $23 \%$ (Eggers et al. 2011). Principal contributing brood year was 2015 (Klukshu River escapement of 11,363 sockeye salmon).

Information from coho salmon partial escapement counts at the Klukshu River in 2016 ( 2,100 fish) and 2017 ( 1,000 fish) suggested the 2020 run would be near the recent average of approximately 2,100 coho salmon.

## U.S. Fisheries

As a Chinook salmon conservation measure, the 2020 Alsek River commercial set gillnet fishery was only 12-hrs for the first opening on June 8th (SW 24). The fishery opened for 24 hours on Sunday, June 14 (SW 25). Traditionally, inseason management decisions were made by monitoring fishery performance data and comparing it to historical CPUE for a given opening to adjust time and area openings. The sockeye salmon directed fishery did not receive any extension for all statistical weeks. Chinook and sockeye salmon harvests were both below the historical and $5-\mathrm{yr}$ average throughout the duration of the directed sockeye salmon fishery. The total number of individual permits fished during the season was 13 permits, which was below the average of 15 permits. Peak sockeye salmon harvest occurred during SW 27 with 10 permits harvesting 686 fish. Effort decline after SW 29 and by SW 33 coho salmon management strategies were in place. Coho salmon are targeted starting in mid-August and effort typically drops during the fall due to or lack of pilots and aircrafts to transport the product to town. Fishing times remained at three days per week throughout the duration of the coho salmon season. The commercial fishing season closed on October 14.

The 2020 Dry Bay commercial set gillnet fishery harvested 182 Chinook and 2,518 sockeye salmon (Table 9). There was no coho, chum or pink salmon harvested.

## Canadian Fisheries

Due to low and variable returns in recent years, and despite 2020 preseason forecasts for Klukshu River Chinook and sockeye salmon which were near average and within/above escapement goals, 2020 Alsek River fisheries were approached with caution by all parties. Chinook salmon returned as expected, eventually above the upper bounds of the escapement goal and management objective, but sockeye salmon returns were very poor and well below those expected with final numbers far below the lower bounds of the escapement goal and the management objective.

Aboriginal fishery harvest opportunities were permitted throughout the season subject to conservation requirements apart from a full CAFN closure of Village Creek to salmon fishing. The Tatshenshini River public angling fishery was closed to all salmon angling (including live release) prior to August 15. On August 15, the recreational fishery was opened with Chinook and sockeye salmon limits set at non-retention only, and coho salmon limits at 2 daily and 4 in possession. On October 9, coho salmon limits were increased to 4 daily and 12 in possession.

An estimated 0 Chinook, 0 sockeye, and 6 coho salmon were harvested in the public angling fishery. Additional limited coho salmon harvest may have occurred as fishing may have taken place after monitoring had ceased, and mandatory catch reporting is not complete. The estimate of Aboriginal fishery harvest (based on the past relationship between the Klukshu River salmon counts and Aboriginal fishery harvest) is 22 Chinook, 218 sockeye, and 0 coho salmon.

Management of salmon in Yukon is a shared responsibility between DFO and the Yukon Salmon Sub-Committee (YSSC). The YSSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the YSSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

Table 10. Klukshu River harvest and escapement for the Chinook and sockeye salmon and Alsek River harvest for Chinook and sockeye salmon for 2020.

|  | Chinook | Sockeye |

Alsek River
Above border run
13,289
Total inriver run
<Above border run above + U.S. harvest>

Total escapement
<Above border run above - U.S. harvest>
a Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
b U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for harvest other than the listed fisheries.

The 2020 Integrated Fisheries Management Plan, developed by DFO in collaboration CAFN and the YSSC, is based on the management objectives and escapement goals described in the Harvest Regulations \& Management Objectives section above. Decision guidelines are agreed to for salmon fisheries management on the Alsek-Tatshenshini Rivers. Next to conservation, the priority in management is to provide for the basic food, social and ceremonial needs of the CAFN. The basic needs allocations are 200 Chinook and 3,000 sockeye salmon, as documented in the CAFN final land claim agreement. Restrictions in the First Nation fishery will be considered if the projected Klukshu River counts are below 800 Chinook salmon, 1,500 early sockeye and/or 7,500 total sockeye salmon. Decisions to implement restrictions will consider management actions taken to conserve stocks in both the Canadian recreational fishery and the U.S. Dry Bay fishery.

For Chinook and early run sockeye salmon management, the Klukshu River counts were reviewed in mid-July to determine if changes to management were warranted. Run projections for Chinook salmon were average, resulting in opening of the public angling fishery on August 15 but not allowing retention of Chinook salmon. Run projections for early run sockeye salmon remained uncertain, so nonretention for sockeye salmon was also implemented when the fishery opened on August 15 . The status of the sockeye salmon run was reviewed again in late August and due to very poor returns, and the escapement goal and the CAFN Basic Needs Level unlikely to be met, nonretention remained in place for the duration of the season. Run projections for coho salmon were average, so when the
fishery was opened on August 15 typical limits of 2 per day and 4 in possession were implemented. The coho salmon run came in stronger than expected, which resulted in an increase in bag limits for coho salmon in the public angling fishery on October 9 to 4 per day and 12 in possession.

The center of Aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines Road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff, small gillnets, sport rods, and traditional fish traps as the fish migrate up the Klukshu River and into Klukshu Lake. The typical fishing plan for the Aboriginal fishery in the Klukshu River and adjacent areas allows for fishing by any means (as established in the communal license) 7 days a week. Fishing typically occurs on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River).

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River bridge crossing upstream to the assessment site to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini rivers confluence.

The 2020 plan did not further restrict the fishery other than CAFN chose to close Village Creek to Aboriginal fishing, and reserve harvests of Chinook salmon at Goat Creek, Stanley Creek, and the Parton River for elders only.

Most of the recreational fishing effort in the Alsek River drainage occurs in the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. Conservation thresholds that had the potential to invoke lifting of restrictions in the recreational fishery were projected Klukshu River counts significantly greater than 1,000 Chinook, 4,500 early run sockeye salmon and 10,500 early / late run combined sockeye salmon.

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the YSSC in 1999, was required by all public salmon fishers in 2020. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon public fishery. Anglers are required to report their catch via email or mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

## Escapement

Alsek River drainagewide abundance programs are being investigated for Chinook and sockeye salmon stocks as part of the development of abundance-based management regimes and to accurately assess whether the current escapement goals are appropriate and if so, are being achieved. Currently, there are no programs in place to estimate the drainagewide coho salmon escapement.

The most reliable long-term comparative escapement index for Alsek River drainage salmon stocks are the Klukshu River counts. Escapements for 2020 are shown in Table 10. A large and annually variable proportion of the drainagewide escapement of each species
is enumerated at Klukshu River, where video enumeration systems have been implemented since 2016. Video enumeration has been implemented on Village Creek since 2014. These video enumeration projects allow salmon passage 24 hours per day and alleviate concerns over impeding and/or handling salmon during periods of low abundance. Since 2018 we have also implemented a successful snorkel survey of the lower Takhanne River to enumerate Chinook salmon. In 2019 we successfully implemented a trial season of sonar enumeration of large ( $>659 \mathrm{~mm}$ MEF) Chinook salmon into the Blanchard River, but this project was not conducted in 2020 due to Covid-19 logistical challenges.

## Chinook Salmon

In 2020, the Klukshu River Chinook salmon count was 1,327 fish and the escapement estimate was 1,316 fish (Table 8). This escapement estimate is above the escapement goal range of 800 to 1,200 Klukshu Chinook salmon and was average. The 2020 Takhanne River peak snorkel survey count was 150 Chinook salmon. The Blanchard River sonar project was not conducted in 2020 due to Covid-19 logistical challenges.

## Sockeye Salmon

In 2020, the Klukshu River sockeye salmon count was 4,396 fish and the escapement estimate was 4,287 fish (Table 8), well below the escapement goal range of 7,500 to 11,000 fish. The count of 204 early run fish (count through August 15) was below the average of 2,905 fish as was the count of 4,192 late run fish compared to an average of 12,292 fish. The sockeye salmon count at Village Creek was 65 fish; this was well below average and the lowest run on record.

## Coho Salmon

The Klukshu River coho salmon count prior to project end was 3,869 fish. As in past years, this only serves as general run strength indicator as the project ends during the coho salmon run to the Klukshu River due to weather and other logistical considerations. The 2020 count was well above the average.

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2020, sockeye salmon eggs were collected at Tahltan Lake on the Stikine River; and Tatsamenie and Trapper lakes on the Taku River. There was no planned egg take at King Salmon Lake.

## Tahltan Lake

In 2020, the egg-take goal was set at 5.0 million eggs in the Stikine River Enhancement Plan. Canadian technical staff lowered the egg-take goal to 0.5 million eggs due to treaty stocking guidelines not to exceed a $1: 1$ ratio of enhanced to wild smolt out-migrating from the lake. Escapement into the lake was 11,158 sockeye salmon. Tahltan Fisheries were
contracted to perform the egg take. Broodstock was collected from September 7th through September 11th. There were no weather delays on the two lots shipped to Snettisham Hatchery in Alaska. There are an estimated 502,200 eggs available before picking, based on an assumed fecundity of 2,700 .

## Tatsamenie Lake

In 2020, the egg-take goal was set at 3.0 million eggs in the Taku Enhancement Production Plan. Metla Environmental Ltd was contracted to collect eggs at Tatsamenie Lake. Broodstock was captured near the assessment weir at the outlet of Tatsamenie Lake and held until ripe. Escapement through the weir was below average at 3,559 sockeye salmon. A total of 618 females were spawned from September 18 through October 7th. Three of the 5 egg shipments were delayed a day due to weather. An estimated 2.0 million sockeye salmon eggs were delivered to Snettisham Hatchery.

## Little Trapper Lake

In 2019, the egg-take goal was set at 1.0 million eggs in the Taku Enhancement Production Plan. Metla Environmental Ltd was funded through the Northern Endowment Fund to collect the eggs at Little Trapper Lake. The resulting fry will be used to evaluate passage of subsequently returning adults at the barrier location between Little Trapper and Trapper Lake that is to be modified as part of the development of an enhancement program. Escapement into the lake was 7,670 sockeye salmon, with 1,894 being female (25\%). An estimated 537,000 eggs were collected from September 4 through $15^{\text {th }}$. None of the three lots were delayed to the hatchery. An estimated 537,000 sockeye salmon eggs were delivered to Snettisham Hatchery, based on an estimated fecundity of 3,000 eggs per female. Egg takes completed in 2016 and 2017 are expected to result in sockeye returns for passage evaluation in 2020 through 2022.

## King Salmon Lake

In 2020, there were no eggs collected at King Salmon Lake. Additional egg takes are planned for 2021 and 2022.

## Incubation, Thermal Marking, and Fry Plants

Snettisham Hatchery is operated by DIPAC, a private aquaculture organization in Juneau. A cooperative agreement between ADF\&G and DIPAC provides for Snettisham Hatchery to be run by DIPAC for the State of Alaska. Snettisham Hatchery is used to incubate sockeye salmon eggs for the joint TBR enhancement projects.

In 2020, brood year 2019 fry were transported to the appropriate systems from May 27th to June11th. Two incubators of Tahltan Lake sockeye salmon (404,297 fry) were lost to IHNV. Egg incubation and thermal-marking at Snettisham Hatchery went smoothly.

## Tahltan Lake

In 2020, a total of 2.7 million sockeye salmon fry were stocked back into Tahltan Lake. These fish were from eggs collected in Tahltan Lake in the fall of 2019. Approximately 0.8 million sockeye salmon smolt left the lake in the spring of 2020, with an estimated $82 \%$ of them from enhancement efforts.

## Tuya Lake

Since 2014, fry planting into Tuya Lake has been discontinued due to Canadian domestic concerns.

## Tatsamenie Lake

In 2020, a total of 1.6 million sockeye salmon fry were stocked in Tatsamenie Lake. These fry were from eggs collected at Tatsamenie Lake in the fall of 2019. Approximately 1.4 million sockeye salmon fry were released directly into the lake on June 4, 6 and 10th. On June 10 and 11, approximately 210,000 were placed in pens for lake rearing. Those fish were released on June $30^{\text {th }}$ at approximately 1.6 grams. Approximately 913,000 smolt left the lake with $40 \%$ being from enhancement effort. Full evaluation of the success of extended rearing will not be available until these fish return as adults.

## Trapper Lake

In 2020, approximately 263,000 fry were released in Trapper Lake.

## Sockeye Supplementation Evaluation Surveys

## Acoustic, Trawl, Beach Seine and Limnological Sampling

Standard limnological surveys were conducted at Tatsamenie and Tahltan lakes. No surveys were conducted on Tuya. In 2020, a hydroacoustic telemetry project funded by the Northern Endowment Fund was to be completed at Trapper Lake to understand sockeye and kokanee movements and interactions however it was postponed due complications related to the pandemic. DFO Salmonid Enhancement Program completed field investigation work at Trapper Lake including assessment of bathymetry, resident fish species size, and completed hydroacoustic transmission tests to prepare for the postponed telemetry project. Water level and temperature was also assessed and recording loggers installed to understand lake and tributary habitats including Kowatua Creek water levels to inform the barrier passage designs.

## Thermal Mark Laboratories

## ADF \&G Thermal Mark Laboratory

During the 2020 season, the ADF\&G Thermal Mark Lab processed 10,190 sockeye salmon otoliths collected by ADF\&G and DFO staff as part of the U.S./Canada fry-stocking
evaluation program. These collections came from commercial and test fisheries in both U.S. and Canadian waters on the Taku and Stikine Rivers over a 12 -week period. The laboratory provided estimates on hatchery contributions for 70 distinct sample collections. Estimates of the percentage of hatchery fish contributed to commercial fishery catches were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.

Postseason estimates of stocked fish to Alaskan harvests were 2,199 Stikine River fish to U.S. fisheries (subsistence, District 106 and 108), and 200 Taku River fish to District 111. Postseason estimates of stocked fish to Canadian fisheries included 6,293 fish to Stikine River fisheries and 339 fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Postseason, the Canadian DFO thermal mark lab in Whitehorse processed 1,075 smolt and 1,320 adult sockeye otoliths collected from six different 2020 projects. This provided critical information for monitoring proportion of enhanced fish in smolt outmigrations and adults returns in 2020.

## APPENDICES

## Standards

All estimates are considered final
Large Chinook salmon are MEF length $\geq 660 \mathrm{~mm}$
Unless otherwise stated Chinook salmon are large
Test fisheries for Chinook salmon became commercial assessment/test fisheries starting in 2004
Data not available to estimate harvests of Alaska Hatchery pink and chum salmon
All harvest of Tahltan and Tatsamenie lake sockeye salmon, unless otherwise noted, include both wild and hatchery fish.

## Bold numbers are incomplete or interpolated numbers

Italicized numbers are used when the GSI estimates do not meet acceptable levels of precision and accuracy agreed upon by the TTC (April 2013): to estimate the proportion of mixtures within $10 \%$ of the true mixture $90 \%$ of the time.

Appendix B. 19. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2020.

| In 1979-1988, there were US estimates and 1983-1988, they overlapped with estimates from Canada |  |  |  |
| :--- | :---: | :---: | :---: |
| and the All tahltan estimate was oftened averaged. The estimates are from the LRCF, test, or average of LRCF and Test. |  |  |  |
|  |  |  |  |
| Year | All Tahltan | Mainstem | Tuya |

Appendix D. 5. Taku River large Chinook salmon terminal run size, 1979-2020.

| Run estimate does not include spawning escapements below the U.S./Canada border. U.S. harvest estimates after 2004 are based on GSI (gillnet and sport fish) and CWT (troll) and harvest in the fisheries between SW 18-29. |  |  |  |  |  |  |  |  |

## Appendix D. 23. Canyon Island fish wheel salmon counts and periods of operation on

 the Taku River, 1984-2020.Total counts from both fish wheels and supplemental gillnets when water is low.
In 2018 caution for comparisons to long-term average; fish wheels not run 24 hrs due to change in sample methods to hourly checks with nightime fish wheel stops.

| Year | Period of Operation | Catch |  |  |  |  |  |  | Downriver Fish Wheel 3 |  |  |  |  | Steelhead |
