# PACIFIC SALMON COMMISSION JOINT TRANSBOUNDARY TECHNICAL COMMITTEE REPORT 

## ESTIMATES OF TRANSBOUNDARY RIVER SALMON PRODUCTION, HARVEST AND ESCAPEMENT AND A REVIEW OF JOINT ENHANCEMENT ACTIVITIES IN 1998 <br> TCTR (2000)-1

February 5, 2000

## ACRONYMS

| ADF\&G | Alaska Department of Fish and Game |
| :--- | :--- |
| AF | Aboriginal Fishery |
| CAFN | Champagne Aishihik First Nation |
| CPUE | Catch Per Unit Effort |
| CWT | Coded Wire Tag |
| DFO | Department of Fisheries and Oceans (Canada) |
| DIPAC | Douglas Island Pink and Chum (Private Hatchery) |
| ESSR | Excess Salmon to Spawning Requirement (surplus fishery license) |
| IHN | Infectious Hematopoietic Necrosis (a virus which infects sockeye salmon) |
| LCM | Latent Class Model |
| MEF | Mid-Eye-Fork (fish length measurement) |
| POH | Post-Obital-Hyperal (fish length measurement) |
| PSC | Pacific Salmon Commission |
| SMM | Stikine Management Model |
| SPA | Scale Pattern Analysis |
| TAC | Total Allowable Catch |
| TRTFN | Taku River Tlingit First Nation |
| TBR | Transboundary River |
| TTC | Transboundary Technical Committee |
| YSC | Yukon Salmon Committee |

Appendix A.1. Weekly salmon catch and effort in the Alaskan Subdistrict 106-41\&42 (Sumner Strait) commercial drift gillnet fishery, 1998. ..... 53
Appendix A.2. Weekly stock proportions and catches of sockeye salmon harvested in the Alaskan Subdistrict 106-41\&42 (Sumner Strait) commercial drift gillnet fishery, 1998. Data based on scale pattern analysis ..... 53
Appendix A.3. Weekly salmon catch and effort in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 1998. ..... 54
Appendix A.4. Weekly stock proportions and catches of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 1998. Data based on scale pattern analysis ..... 54
Appendix A.5. Weekly salmon catch in the Alaskan District 106 commercial drift gillnet fisheries, 1998. Catches do not include Blind Slough terminal area harvests. Effort may be less than the sum of effort from 106-41\&42 and 106-30 because some boats fished in more than one subdistrict. Data based on scale pattern analysis. ..... 56
Appendix A.6. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 106 commercial drift gillnet fisheries, 1998. Data based on SPA. ..... 57
Appendix A.7. Weekly salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 1998. Catches do not include Ohmer Creek terminal area harvests. The permit days are adjusted for boats which did not fish the entire opening and are less than the sum of the permits times the days open. ..... 58
Appendix A.8. Weekly stock proportions and stock-specific catch of sockeye salmon in the Alaskan District 108 commercial drift gillnet fishery, 1998. Catches do not include Ohmer Creek terminal area harvests. Data based on SPA ..... 59
Appendix A.9. Weekly salmon catch and effort and sockeye stock composition in the Alaskan District 108 test fishery, 1998. ..... 59
Appendix A.10. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the lower Stikine River, 1998. ..... 60
Appendix A.11. Weekly sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery in the lower Stikine River, 1998. Sex specific age compositions were calculated and the stock composition of the females sampled for egg diameters was expanded to the catch by age ..... 60
Appendix A.12. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the upper Stikine River, 1998. ..... 62
Appendix A.13. Weekly salmon and steelhead trout catch and effort in the Canadian aboriginal fishery located at Telegraph Creek, on the Stikine River, 1998. ..... 62
Appendix A.14. Catch by stock by week for sockeye salmon harvested in the Canadian upper river commercial and aboriginal fisheries in the Stikine River, 1998. ..... 62
Appendix A.15. Weekly salmon and steelhead trout catch and effort in the Canadian test fishery in the Stikine River, 1998. ..... 63
Appendix A.16. Weekly catch, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye stocks in the Stikine test fishery, 1998. Sex specific age compositions were calculated and the smoothed stock compositions of the females sampled for egg diameters was expanded to the catch by age. ..... 64
Appendix A.17.Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 1998 ..... 65
Appendix A.18. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir,
1998 ..... 66
Appendix A.19. Daily counts of adult chinook salmon passing through Little Tahltan weir, 1998 ..... 67
Appendix B.1. Salmon catch and effort in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 1960-1998 ..... 68
Appendix B.2. Stock proportions and catches of sockeye salmon in the Alaskan Subdistrict 106- 41/42 (Sumner Strait) commercial drift gillnet fishery, 1985-1998. Data based on SPA. ..... 69
Appendix B.3. Salmon catch and effort in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 1960-1998 ..... 70
Appendix B.4. Stock proportions and catches of sockeye salmon in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gilhet fishery, 1985-1998. Data based on SPA ..... 71
Appendix B.5. Salmon catch and effort in the Alaskan District 106 commercial drift gillnet fisheries, 1964-1998. Catches do not include Blind Slough terminal area harvests. Effort may be less than the sum of effort from $106-41 / 42$ and $106-30$ since some boats fished in more than one subdistrict ..... 72
Appendix B.6. Stock proportions and catches of sockeye salmon in the Alaskan District 106 commercial drift gillnet fisheries, 1982-1998. Catches do not include Blind Slough terminal area harvest. Data based on SPA ..... 73
Appendix B.7. Salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 1960-1998. Catches do not include Ohmer Creek terminal area harvests. Permit days are adjusted for boats which did not fish the entire opening and may total less than the sum of the permits times days open. ..... 74
Appendix B.8. Stock proportions and catches of sockeye salmon in the Alaskan District 108 commercial drift gillnet fishery, 1985-1998. Catches do not include Ohmer Creek terminal area harvests. Data based on SPA ..... 75
Appendix B.9. Salmon catch in the Alaskan District 106 and 108 test fisheries, 1984-1998. Only years with test fishery openings are listed ..... 76
Appendix B.10. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-1998. Data based on SPA. Only years with test fishery openings are listed. ..... 77
Appendix B.11. Stock specific catches of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-1998. Data based on SPA. Only years with test fishery openings are listed ..... 78
Appendix B.12. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the lower Stikine River, 1979-1998 ..... 79
Appendix B.13. Sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery in the lower Stikine River, 1979-1998. Stock compositions based on: scale circuli counts 1970-1983; SPA in 1985; average of SPA and GPA 1986; SPA in 1987 and 1988; and egg diameter in 1989-1998 ..... 79
Appendix B.14. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the upper Stikine River, 1975-1998 ..... 81
Appendix B.15. Salmon and steelhead trout catch in the Canadian aboriginal fishery located at Telegraph Creek, on the Stikine River, 1972-1998. ..... 81
Appendix B.16. Stock specific sockeye catches in the Canadian upper river commercial and aboriginal fisheries in the Stikine River, 1972-1998. ..... 82
Appendix B.17. Salmon and steelhead trout catch in the combined Canadian net fisheries in the Stikine River, 1972-1998. ESSR catches not included ..... 83
Appendix B.18. Salmon catches in the Stikine River harvested under Canadian ESSR licenses, 1992-1998 ..... 83
Appendix B.19. Salmon and steelhead trout catches and effort in Canadian test fisheries in the Stikine River, 1985-1998 ..... 84
Appendix B.20. Sockeye salmon stock proportions and catch by stock in the test fishery in the lower Stikine River, 1985-1998. Stock composition based on: SPA 1985; average of SPA and GPA 1986-1988; egg diameter 1989-1998 ..... 85
Appendix B.21. Estitnated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye stocks, 1979-1998. Stock compositions based on: scale circuli counts 1979-1983; SPA in 1985; average of SPA and GPA 1986-1988; and egg diameter analysis in 1989-1998. 1994-1998 data from commercial catch and CPUE ..... 85
Appendix B.22. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-1998 ..... 86
Appendix B.23. Aerial survey counts of Mainstem sockeye stocks in the Stikine River drainage, 1984-1998. The index represents the combined counts from eight spawning areas ..... 87
Appendix B.24. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 1984-1998 ..... 87
Appendix B.25. Weir counts of chinook salmon at Little Tahltan River, 1985-1998 ..... 88
Appendix B.26. Index counts of Stikine chinook escapements, 1979-1998. Counts do not include jacks (fish $<660 \mathrm{~mm}$ mef length). ..... 88
Appendix B.27. Index counts of Stikine coho salnon escapements, 1984-1998. Missing data due to poor survey conditions. ..... 89
Appendix B.28. Stikine River sockeye salmon run size, 1979-1998. Catches include test fishery catches. ..... 90
Appendix C.1. Weekly salmon catch and effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet), commercial drift gillnet fishery, 1998 ..... 92
Appendix C.2. Estimate of the proportion of natural and planted sockeye salmon stock groups harvested in the Alaskan District 111 commercial drift gillnet fishery by week, 1998. Stock compositions estimated with scale pattern analysis, planted fish estimated from analysis of thermal marks ..... 94
Appendix C.3. Weekly stock-specific catch of wild and planted Taku River and Port Snettisham sockeye salmon harvested in the Alaskan District 111 commercial drift gillnet fishery, 1998. Stock compositions estimated with scale pattern analysis, planted fish estimated from analysis of thermal marks ..... 94
Appendix C.4. Weekly salmon and steethead trout catch and effort in the Canadian commercial fishery in the Taku River, 1998 ..... 95
Appendix C.5. Weekly stock proportions of sockeye salmon harvested in the Canadian commercial fishery in the Taku River, 1998. Stock compositions estimated with scale pattern analysis, planted fish estimated from analysis of thermal marks. ..... 95
Appendix C.6. Weekly stock-specific catch of sockeye salmon in the Canadian commercial fishery in the Taku River, 1998. Stock compositions estimated with scale pattern analysis, planted fish estimated from analysis of thermal marks. ..... 96
Appendix C.7. Mark-recapture estimate of above border run of sockeye and coho salmon in the Taku River, 1998 ..... 96
Appendix C.8. Daily counts of adult salmon passing through Tatsamenie weir, 1998 ..... 97
Appendix C.9. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 1998. ..... 99
Appendix C.10. Daily counts of adult salmon passing through the Nahlin River weir, 1998. Chinook counts represent an unknown portion of the escapement because the weir was not operated throughout the entire run ..... 100
Appendix C.11. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 1998. ..... 101
Appendix C.12. Daily counts of chinook salmon carcasses at the Nakina River weir, 1998. ..... 102
Appendix D.1. Salmon catches and effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet) commercial drift gillnet fishery, 1960-1998. Days open are for the entire district and include openings to harvest spawner chinook salmon, 1960-1975 ..... 103
Appendix D.2. Stock proportions and catches of sockeye salmon in the Alaska District 111 commercial drift gillnet fishery, 1983-1998. Data based on analysis of scale patterns, otolith marks, and incidence of brain parasites ..... 105
Appendix D.3. Proportion of wild Takı River sockeye salmon in the Alaskan District 111 commercial drift gillnet catch by week, 1983-1998.a Data based on scale patterns and incidence of brain parasites. Hatchery fish are not included in these numbers. ..... 106
Appendix D.4. Salmon catch in the U.S. subsistence and personal use fisheries in the Taku River, 1967-1998. The subsistence fishery was open 1967 to 1976 and 1985 and the personal use fishery was open 1989-1998. ..... 106
Appendix D.5. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the Taku River, 1979-1998. ..... 107
Appendix D.6. Sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery on the Taku River, 1986-1998. Data based on scale pattern analysis. ..... 107
Appendix D.7. Salmon catches in the Canadian aboriginal fishery on the Taku River, 1980-1998 ..... 108
Appendix D.8. Salmon and steelhead trout catch in the Canadian test fishery in the Taku River, 1987-1998 ..... 108
Appendix D.9. Taku River sockeye salmon run size, 1984-1998. Run estimate does not include spawning escapements below the U.S./ Canada border. The early season sockeye expansion is based on the proportion of fish wheel sockeye catch that occurs before the fishery opens. ..... 109
Appendix D.10. Sockeye salmon escapement estimates of Taku River and Port Snettisham sockeye stocks, 1979-1998. Spawners equals escapement to the weir minus fish collected for brood stock ..... 109
Appendix D.11.Aerial survey index escapement counts of large (3-ocean and older) Taku River chinook salmon, 1975-1998 ..... 110
Appendix D.12. Taku River (above border) coho salmon run size, 1987-1998 ..... 110
Appendix D.13. Escapement counts of Taku River coho salmon, 1984-1998. Counts are for age-. 1 fish and do not include jacks. Because of variability between methods, visibility, observers, and timing, these counts are not an index of run strength ..... 111
Appendix D.14. Canyon Island fish wheel salmon counts and periods of operation on the Taku River, 1983-1998 ..... 111
Appendix E.1. Weekly salmon catch and effort in the U.S. commercial fishery in the Alsek River, 1998 ..... 112
Appendix E.2. Weekly salmon catch and effort in the Canadian aboriginal and sport fisheries in the Alsek River, 1998 ..... 112
Appendix E.3. Daily counts of salmon passing through Klukshu River weir, 1998. ..... 113
Appendix E.4. Salmon catch and effort in the U.S. commercial fishery in the Alsek River, 1960- 1998 ..... 117
Appendix E.5. Salmon catch in the U.S. subsistence and personal use fisheries in the Alsek River, 1976-1998 ..... 118
Appendix E.6. Salmon catches in the Canadian aboriginal and sport fisheries in the Alsek River, 1976-1998 ..... 118
Appendix E.7. Klukshu River weir counts of chinook, sockeye, and coho salmon, 1976-1998. ..... 119
Appendix E.8. Alsek River sockeye counts from U.S. and Canadian aerial surveys and from the electronic counter at Village Creek, 1985-1998. ..... 119
Appendix E.9. Aerial survey index counts of Alsek chinook salmon escapements, 1984-1998. ..... 120

# Appendix E.10. Aerial survey counts of coho salmon from U.S. lower Alsek River tributaries, 1984- 

 1998.
## EXECUTIVE SUMMARY

Estimates of catches and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek Rivers for 1998 are presented and compared with historical patterns. Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Results from transboundary river sockeye fry planting projects are also reviewed.

## Stikine

The 1998 Stikine sockeye run is estimated at 121,448 fish. An estimated 81,085 fish were harvested in various fisheries including test fisheries, 390 fish were taken at the Tahltan Lake weir for otolith samples, 3,099 fish were used for brood stock, 28,344 fish escaped to spawn, and 8,531 fish returned to the Tuya system and were not harvested. The catch and run were both below the 1988-1997 averages and spawning escapements were below goals. The estimated U.S. commercial catch of Stikine sockeye salmon in Districts 106 and 108 was 27,848 fish and the Canadian inriver commercial, aboriginal, and ESSR fishery catches were $38,217,5,586$, and 6,103 fish, respectively. A U.S. test fishery in District 108 harvested 3,141 Stikine sockeye salmon and the Canadian inriver test fishery catch included 190 sockeye salmon. Sockeye salmon originating from outplants into Tahltan and Tuya Lakes contributed an estimated 14,774 ( $11 \%$ of the catch) and 17,656 ( $40 \%$ of the catch) fish to the U.S. and Canadian catches, respectively. The postseason run size estimate of 121,448 Stikine sockeye salmon was below the preseason forecast of 218,500 fish. The Stikine Management Model consistently predicted a run less than the preseason forecast, but did not predict a run as low as the postseason estimate. Weekly inseason model forecasts ranged from 197,000 to 209,000 sockeye salmon; the final inseason model prediction was 208,737 fish (both U.S. and Canada), with a total allowable catch (TAC) of 130,260 fish. Based on the inseason model estimates, both Parties harvested below their $50 \%$ target of the TAC $(65,130$ Stikine fish). However, using the postseason estimate of run size and TAC, both countries exceeded their $50 \%$ portion of the TAC; Canada harvested $125 \%$ and the U.S. harvested $80 \%$ of the TAC. The broodstock collection and otolith sampling removed 3,099 and 390 sockeye salmon, respectively, from the escapement to Tahltan Lake leaving a spawning escapement of 9,169 fish, falling below both the acceptable goal range of 18,000 to 30,000 fish and the warning level of 13,000 fish. The estimated escapement of 19,175 mainstem Stikine sockeye salmon was also below the objective of 20,000 to 40,000 spawners for this stock group.

The chinook catch in Canadian commercial and aboriginal fisheries in the Stikine River was 2,164 large fish and 423 jacks, $95 \%$ and $88 \%$ of the respective 1988-1997 averages. An additional 25 large and 11 jack chinook salmon were taken in the Canadian inriver test fishery. The U.S. marine chinook catch (all stocks) in the District 106 and 108 mixed stock gillnet fisheries was 978 fish, below the 1988-1997 average catch. No chinook salmon were taken in the U.S. District 108 test fishery. The chinook spawning escapement of 4,873 large adults through the Little Tahltan River weir in 1998 was $92 \%$ of the joint U.S./Canada escapement goal of 5,300 fish and $83 \%$ of the 1988-1997 average. Surveys of other Stikine tributaries showed below average escapements. The total Stikine spawning escapement estimated from a mark-recapture program was 25,456 fish.

As with chinook salmon, the U.S. marine harvest of Stikine coho salmon is unknown since there is no stock identification program for this species. Coho catches in Districts 106 and 108 were 273,197 and 19,206 fish, respectively, and were above the 1988-1997 averages. Alaskan hatchery fish comprised approximately $36 \%$ ( 104,172 fish) of the coho harvest from the two districts. The Canadian inriver coho catch of 726 fish was $26 \%$ of the 1988-1997 average. Aerial surveys of six coho spawning index sites indicated below average spawning escapement.

## Taku

The estimated 1998 Taku sockeye run is 145,559 fish, including an estimated catch of 71,106 fish and an above-border-spawning escapement of 74,453 sockeye salmon. The run size and catch were below the respective 1988-1997 averages and the escapement was below average but within the escapement goal range of 71,000 to 80,000 fish. An estimated 49,493 Taku sockeye salmon were harvested in the District 111 commercial fishery, $58 \%$ of the 1988-1997 average, and an estimated 2,338 sockeye salmon were harvested in the U.S. imriver personal use fishery. Canadian inriver commercial and aboriginal fishery catches included 19,038 and 237 sockeye salmon, respectively. The commercial catch was $71 \%$ of the 1988-1997 average, whereas the aboriginal catch was $17 \%$ above average. Since the escapement goal is expressed as a range, the resulting total allowable catch is also expressed as a range. In 1998, Canada harvested an estimated $26 \%$ to $29 \%$, and the U.S. took $70 \%$ to $79 \%$ of the TAC. Sockeye salmon originating from fry plants into Trapper and Tatsamenie Lakes contributed 820 fish to the U.S. commercial catch and 589 fish to the Canadian commercial catch.

The catch of large chinook salmon in the Canadian commercial fishery in the Taku River was 1,107 fish, $67 \%$ of the 1988-1997 average; in addition, 227 jack chinook salmon were caught compared to an average of 196 fish. The Canadian aboriginal fishery in the Taku River harvested 60 large chinook salmon. The chinook catch in the District 111 mixed stock gillnet fishery was 794 fish, the lowest on record and $23 \%$ of the 1988-1997 average. Approximately $37 \%$ of the catch was estimated to be of Alaska hatchery origin. The escapement of 6,295 chinook salmon counted in Taku River index areas was $54 \%$ of the 1988-1997 average and $48 \%$ of the index escapement goal of 13,200 fish.

The estimated above border run size of Taku River coho salmon in 1998 is 66,472 fish, $87 \%$ of the 19881997 average. The Canadian inriver commercial catch included 5,090 coho salmon, $92 \%$ of the 1988 1997 average. The above-border-spawning escapement is estimated at 61,382 coho salmon, which exceeds the interim escapement goal range of 27,500 to 35,000 fish. The U.S. harvest of 28,713 coho salmon in the District 111 mixed stock fishery was $34 \%$ of the 1988-1997 average. Alaskan hatcheries contributed an estimated $21 \%$ of the District 111 harvest, or 5,931 fish.

The catch of pink salmon in District 111 was 168,283 fish, $20 \%$ above the 1988-1997 average catch of 140,407 fish. Pink salmon were not retained in the Canadian commercial inriver fishery in 1998. The escapement of pink salmon to the Taku River was likely above average as evidenced by the fish wheel catch and release of 23,347 pink salmon, $69 \%$ above the 1988-1997 average.

The catch of chum salmon in the District 111 fishery was 296,306 fish, composed of 291,416 summer run fish (prior to mid-August) and 4,695 fall run fish. The catch of summer chum salmon, primarily Alaskan hatchery stocks, was $75 \%$ above the 1988-1997 average and was the third highest on record. The Taku River does not have a summer chum run. The catch of fall chum salmon, composed of wild Taku River and Port Snettisham stocks, was $25 \%$ of the 1988-1997 average. As with pink salmon, there was non-retention of chum salmon in the Canadian inriver fishery and the reported catch was 2 fish in 1998. Spawning escapement appeared to be poor; the Canyon Island fish wheel catch of 179 chum salmon was $32 \%$ of the 1988-1997 average and the second lowest on records dating back to 1984 .

#### Abstract

Alsek The Alsek River sockeye harvest of 15,007 fish in the U.S. commercial fishery was $80 \%$ of the 1988 1997 average. The Canadian inriver catch of 585 sockeye salmon was the second lowest on record, following 1997 and was $27 \%$ of the 1988-1997 average. The aboriginal fishery harvested 567 sockeye salmon, $32 \%$ of the 1988-1997 average. The catch of 18 sockeye salmon in the sport fishery was the lowest on record and $5 \%$ of the 1988-1997 average. The low catches were the result of extensive closures in the sport and aboriginal fisheries due to conservation concerns. The escapement to the Klukshu River weir of 13,580 fish was $86 \%$ of the 1988-1997 average. The Klukshu weir count of 597 early run sockeye (count through August 15) was $16 \%$ of the 1988-1997 average, whereas the count of 12,994 late run fish was $98 \%$ of average for the same period. Counts in other index areas were less than $20 \%$ of average.

The chinook run to the Alsek River seemed below average. The U.S. Dry Bay catch of 550 chinook salmon was $36 \%$ above the 1988-1997 average. The combined Canadian sport and aboriginal fishery catch of 329 chinook salmon was $48 \%$ of the $1988-1997$ average. The 1,364 chinook salmon counted through the Klukshu River weir was the second lowest on record and was $46 \%$ of the 1988-1997 average. Of the total count, 1,347 chinook salmon were estimated to have spawned, thus achieving the minimum spawning escapement goal of $>1,100$ chinook salmon, established by the TTC for 1998. Aerial survey index counts of other spawning systems were below average

The coho run to the Alsek River was about average although current stock assessment programs prevent an accurate comparison with historical runs. The U.S. Dry Bay catch of 4,925 coho salmon was $85 \%$ of the 1988-1997 average, while the combined Canadian inriver aboriginal and sport fishery catch of 112 fish was $65 \%$ of the 1988-1997 average. The low catch was due to closures in the fisheries because of sockeye conservation concerns. The operation of the Klukshu weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is over; however, it does provide a suitable annual index. The count of 1,961 coho salmon was $80 \%$ of the 1988-1997 average.

## Enhancement

Eggs and milt were collected from the 1998 sockeye escapements at Tahltan and Tatsamenie Lakes. A total of 4.3 million eggs were collected at Tahltan Lake, $72 \%$ of the 6.0 million egg-take goal; the goal was not attained due to poor escapement to the lake in 1998. At Tatsamenie Lake, approximately 2.6 million eggs were taken, thus achieving the goal to take between 2.5 and 5.0 million eggs from this system in 1998.

Outplants of 1997 brood-year sockeye fry in June 1998 included 1.9 million fry into Tahltan Lake, 0.4 million fry of Tahltan Lake origin into Tuya Lake, and 3.6 million fry into Tatsamenie Lake. Green-egg to planted-fry survivals were $82 \%, 91 \%$, and $77 \%$ for these outplants, respectively. Survival to emergence was generally at, or below, expected levels, partially due to a loss of approximately 178,577 fry due to Infectious Hematopoietic Necrosis (IHN).

Sampling of outmigrating smolts was conducted at Tahltan, Tuya, and Tatsamenie Lakes, systems that had been stocked with sockeye fry in previous years. Sockeye smolts were captured at all lakes. Total emigration from Tahltan Lake in 1998 was an estimated 540,866 smolts, with an estimated 214,446 smolts from fry plants. The sampling program at Tuya Lake provided age and size composition of the smolts but no estimate of total outmigration. At Tatsamenie Lake, an estimated $2,291,000$ smolt outmigrated from the lake; this estimate was derived from mark-recapture data and is the highest on record.

The egg incubation and thermal-marking program at Snettisham Hatchery were continued in 1998. Snettisham hatchery is operated by DIPAC (Douglas Island Pink and Chum, Inc.), a private aquaculture organization in Juneau. A co-operative agreement between ADF\&G and DIPAC provides for Snettisham to serve the needs of the joint TBR fry planting projects.

Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate the weekly contribution of fish from U.S./Canada fry planting programs to the District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku Rivers

## INTRODUCTION

This report presents estimates of the 1998 catch and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek Rivers and discusses management actions taken during the season. Catch and effort data are presented by management week (U.S. statistical week) for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint fry planting activities on the Stikine and Taku Rivers are also summarized.

The Transboundary Technical Committee (TTC) met prior to the season to update joint management, stock assessment and enhancement plans and determine forecasts for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: Pacific Salmon Commission Transboundary Technical Committee. 1999. Salmon Management and Enhtrncement Plans for the Stikine, Taku and Alsek rivers, 1998. Report TCTR(99)-1.

Run reconstruction analyses are conducted on the sockeye runs to the three rivers for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine catch are made for U.S. fisheries outside of Districts 106 and 108 for Stikine stocks, District 111 for Taku stocks and Subdistricts 182-30 \& 31 for Alsek stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. gillnet fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet fisheries located in the lower and upper Stikine River, and by a Canadian aboriginal fishery in the upper portion of the river. When escapements are estimated to be surplus to spawning requirements (ESSR) Canadian terminal area fisheries are opened on the lower Tuya River and/or at Tahltan Lake (Figure 1). A small sport fishery also exists in the Canadian sections of the Stikine drainage. In 1995, a United States personal use fishery was established in the lower Stikine River; no catches were reported in this fishery in 1995 through 1998. Additional catches of unknown quantity are taken in U.S. troll and seine fisheries and in sport fisheries near Wrangell and Petersburg. In 1996, the spring experimental troll area in the District 9 portion of Frederick Sound was expanded to target hatchery chinook salmon; four previous areas were combined into one large area that also included previously unopened waters. This area was the same in 1998.

## Harvest Regulations and the Joint Management Model

Harvest arrangements for Stikine salmon were not negotiated by the Pacific Salmon Commission or Canadian and United States governments or stakeholder groups prior to the 1998 season. As a result, the Parties unilaterally developed the following management plans for the 1998 season:

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

1. Canada developed a fishing plan for the Stikine River which adopted the PSC arrangements for sockeye salmon ( $50: 50$ sharing which had not expired) but excluded the catch ceiling for coho salmon which had expired in 1992 ( 4,000 pieces). The harvest-sharing objective for the sockeye season was to share the total allowable catch (TAC) of Stikine River sockeye salmon $50 \%$ to Canada and $50 \%$ to the United States. In the event that there was sockeye surplus to spawning requirements at Tahltan Lake and/or in the Tuya River, attempts would be made to harvest some of the surplus. The plan did not permit targeting on chinook salmon since both Parties had previously agreed to rebuild chinook salmon by 1995 and the joint assessment of the status of rebuilding efforts has not yet been completed.
2. The United States management plan was to abide by the harvest sharing provisions that were in effect in 1993; namely to harvest $50 \%$ of the TAC of Stikine sockeye salmon (wild plus planted), to incidentally harvest chinook salmon and to provide for a Canadian harvest of 4,000 coho salmon.

As in most previous years, the Transboundary Technical Committee (TTC) met prior to the season to update joint management and enhancement plans, develop run forecasts and determine new parameters for input into the inseason run forecast model, referred to as the Stikine Management Model (SMM). The model was upgraded to provide inseason forecasts of the total Stikine sockeye run as well as the following components of the run: the Tahltan stock (wild and planted combined); the planted Tuya stock; and the wild mainstem stocks.

In 1998, the preseason forecasts were used during statistical week 25 (June 14 to June 20) through statistical week 27 (June 28 to July 04). After week 27, inseason forecasts of total run size and TAC, produced by the SMM and based on catch-per-unit-effort (CPUE) data, were used to assist in determining weekly fishing plans (Table 1). The weekly inputs to the model included: the catch, effort and stock composition (proportion Tahltan/Tuya from egg diameters, proportion planted Tuya from thermal mark analyses of otoliths) in the Canadian lower river test and commercial fisheries; the upper river catch in the aboriginal fishery (AF) and upper river commercial fishery; the catch, effort and assumed stock composition in Subdistrict 106-41; and, the catch and assumed stock composition in District 108 and Subdistrict 106-30. Unlike previous years, preliminary results of thermal mark analyses were available inseason for the lower inriver fisheries to account for Tuya production in the model and reduce the risk of over-estimating the TAC of the Tahltan sockeye stock, which was expected to be below average in 1998.

Initially, average stock proportions in District 106 and I08 catches, from historical postseason scale pattern analysis (SPA), were assumed for weekly catches. The averages used each week depended upon whether the run was judged to be below average, average, or above average. The Tahltan/Tuya stock proportions were subsequently adjusted inseason based on the analysis of otolith samples collected from District 106 and 108 catches. Inseason otolith sampling was conducted to estimate the contribution of planted Tahltan and Tuya Lake fish to catches in these areas. The weekly estimate of Tuya fish in District 106-41 was added to the historical proportion of Tahltan fish in the SMM since this stock was not present in the historical database. No adjustments were made in District 108. Because different proportions of Tahltan fish were observed in subdistricts of District 108, the overall contribution estimates for District 108 were weighted according to catches in the subdistricts.

The preseason forecast of the Stikine sockeye run was 218,500 fish, which indicated a run size above the 1988-1997 average run size of approximately 191,000 fish (Appendix B.28). Canadian inseason predictions of total run ranged from 196,746 to 208,755 sockeye salmon; U.S. forecasts ranged from

196,746 to 219,938 fish (Table 1). All forecasts indicated an above average run, although all were below the preseason estimate. U.S. and Canadian weekly predictions differed only slightly this year; differences were due to different catch data input used for the updates.

Table 1. Weekly forecasts of run size and total allowable catch for Stikine River sockeye salmon as determined inseason by the Stikine Management Model, 1998.

## U.S. Fisheries

The 1998 harvest in the District 106 commercial gillnet fishery included 518 chinook, 113,435 sockeye, 273,197 coho, 502,655 pink, and 332,022 chum salmon (Appendix B.5). In the District 108 fishery, 460 chinook, 22,031 sockeye, 19,206 coho, 39,246 pink and 41,057 chum salmon were harvested (Appendix B.7). District 106 catches of chinook and sockeye salmon were $41 \%$ and $59 \%$ of the 1988 -1997 respective averages. The coho catch was the second highest on record and $57 \%$ above average, the chum catch was a record and 2.1 times the average, and the pink catch was $30 \%$ above average (Figure 2). The District 108 chinook and sockeye catches were $35 \%$, and $37 \%$ of their respective 1988-1997 averages. The coho catch was $29 \%$ above average, the pink catch was $17 \%$ above average, and the chum catch was $28 \%$ above average and the third highest on record. Weekly commercial and test fishery catches and stock composition estimates for these fisheries are provided in Appendices A.1-A. 9 and annual catches from 1960 to 1998 are provided in Appendices B.1-B.11. Catches of each species in Districts 106 and 108 consist of fish of mixed stock origin; the contribution of Stikine River stocks is estimated only for sockeye salmon.

Figure 2. Average catches and fishing efforts compared with 1998 for the Alaska Districts 106 and 108 and for the Canadian inriver fisheries in the Stikine River.

The estimated of the contribution of Stikine sockeye salmon to the District 106 and 108 catch is 27,848 fish or $21 \%$ of the total sockeye catch of 135,466 fish. The Sumner Strait fishery (Subdistricts 106-41 \& 10642) harvested 8,912 Stikine sockeye salmon (Appendix A.2), $11 \%$ of the total sockeye harvest in that subdistrict, and the Clarence Strait fishery (Subdistrict 106-30) harvested 1,822 Stikine fish (Appendix A.4), $5 \%$ of the total sockeye catch in that subdistrict. The District 108 fishery harvested 17,114 Stikine sockeye salmon (Appendix A.8), $78 \%$ of the District 108 sockeye catch (Figure 3).

The Districts 106 and 108 fishing seasons began on June 21 (statistical week 26) and continued through October 6 (statistical week 41). The initial week 26 opening was two days in both districts. The initial opening in District 106 is normally two days and any decision to extend fishing is based on fishery catch rates estimated by management biologists on site in the fishery. The sockeye CPUE in both districts was above the 1988-1997 average for this week and the otolith analysis in the District 108 test fishery showed a Tuya:Tahitan ratio of approximately $57: 43$. Based on the catch and otolith information and the preseason forecast of 65,000 Tahltan fish, a 24 -hour extension was allowed in both districts to harvest the apparent surplus of Tahltan sockeye salmon. During statistical week 27 the fishery was open for two days. The sockeye catch in District 108 was well above the 1988-1997 average, but the catches in District 106 were roughly half of the average. Stock identification analyses indicated a higher percentage of Tahltan fish in Frederick Sound test fishery than was present in the Stikine Strait test fishery. The inriver and District 108 commercial fisheries also showed a lower percentage of Tahltan fish than Tuya fish in the catches. The Sumner Strait commercial catch showed no Tahltan stock present. No extension or midweek openings were allowed during week 27. During statistical week 28, Districts 106 and 108 were initially open for two days. The CPUE in District 108 ( 74 sockeye/boat/day) and Sumner Strait ( 70 sockeye/boat/day) were below average, while Clarence Strait CPUE of 105 sockeye/boat/day was slightly above average. Based on the District 106 sockeye catches, no extension was warranted in that district. However, otolith analysis and the SMM predicted the Tahltan run strength to be near the 64,000 fish preseason forecast, which would allow a U.S. TAC of 20,000 . The estimated Tahltan harvest in Districts 106 and 108 was 6,000 fish through week 27, which would leave 14,000 additional Tahltan fish to catch. Based on the available information, a midweek opening in District 108 was considered. However, samples from Frederick Sound indicated that portion of District 108 had a higher abundance of Tahltan than Tuya fish. In order to target effort on predominately Tuya fish, a 48-hour midweek opening was allowed from 12:00 noon Wednesday, July 8 through 12:00 noon, Friday, July 10 in the Stikine Strait portion of District 108 (Section 8B) only. During statistical week 29 Districts 106 and 108 were open for two days. Sockeye CPUE was poor in District 108, slightly above average in Clarence Strait, and approximately half the average in Sumner Strait. Although the SMM predicted the Tahltan run to be 56,224 fish, the catch rates in District 106 didn't support this. Therefore, based on the District 106 catch and the poor catches in the week 28 District 108 midweek opening, no extensions or mid-week openings were warranted. During statistical week 30 Districts 106 and 108 were open for two days. The sockeye catch in Clarence Strait after the first day of fishing was $63 / \mathrm{boat}$, which was only half the 1988-1997 average. The Sumner Strait sockeye catch after nearly two days of fishing was 115 sockeye/boat, which was the lowest catch/boat in the past 10 years. Due to the low sockeye catches no extensions or midweek openings were warranted. During statistical week 31 both districts were initially open for two days. The sockeye catch after the first day of fishing in Clarence Strait was 70/boat (1988-1997 average of 55) and the catch after nearly two days of fishing in Sumner strait was 149/boat, equal to the 1988-1997 average. Fishing effort was lower in District 106 this week than in past weeks. Due to the above average sockeye catches, the fisheries in Districts 106 and 108 were extended for 24 hours until 12:00 noon, Wednesday, 29 July.

Figure 3. Sockeye catches for the Alaska District 106 and 108 and the combined Canadian fisheries in the Stikine River and Stikine sockeye escapements, 1979-1998.

A test fishery was conducted in District 108 during 1998 to determine if catchability of Tuya sockeye salmon varied with changing mesh size of gillnet gear. Since $25 \%$ or more of the Tuya run may be comprised of fish which spend two years in the ocean and generally few Tahltan fish spend less than three years in the ocean, it was hypothesized that Tuya fish would be more susceptible than Tahltan fish to capture in small mesh gilhets. If the two stocks could be harvested at different rates then it might be possible to institute mesh size restrictions during years of low Tahltan runs in order to minimize harvest of the Tahltan stock while fishing for the Tuya stock. Six gillnet vessels (three in Frederick Sound and three in the Sumner Strait portion of District 108) were contracted to fish for up to three days for three consecutive weeks at specific locations of their choosing beginning on Tuesday, 16 June. Each of the vessels at each location fished different mesh sizes. The three mesh sizes fished were 4.625 to 4.875 inches ( 11.81 cm to 12.38 cm ); 5.00 to 5.25 inches ( 12.7 cm to 13.65 cm ); and 5.375 to 5.625 inches ( 13.65 cm to 14.29 cm ). Preliminary results after the first season showed a slight difference in the catch of 2-ocean age sockeye salmon between mesh sizes, with the smallest mesh size catching a higher percentage than either of the other mesh sizes. However, the gillnet hang ratios were not standardized, therefore, the different amounts of web hung could have accounted for the differences. Preliminary results also indicate Tuya sockeye salmon may migrate at a slightly higher rate through Sumner Strait and the southern entrance to the Stikine River than through the northern entrance, Frederick Sound. The test fishery is being scheduled again for 1999 and the hanging ratios will be standardized.

Area restrictions were used around the mouth of the Stikine River for the first three openings (statistical weeks 26 through 28) and in portions of Frederick Sound each week during the sockeye and pink fisheries to protect adult chinook salmon returning to the Stikine River. From July 12 through 29, the closure line for District 108 was at the Point Rothsay to Indian Point line.

The management emphasis changed from sockeye to pink salmon during statistical week 32 (August 2 to 8). Pink salmon management normally begins near week 33 but the very large expected run of pink salmon to District 106 and the lack of Stikine bound sockeye salmon in the week 31 catch prompted an early switch to directed pink management effort in both Districts 106 and 108. Pink salmon catches in both districts are not always a true reflection of the pink salmon abundance in the area because the low pink salmon price, along with a high abundance of other species, affect the fishing patterns and methods. Three-day fishing periods were allowed during the first two weeks (statistical week 32 and 33, Aug 2-15) of pink salmon management in both districts and a four-day fishery was allowed during the third week (statistical weeks 34, Aug 16-22). The pink salmon escapements throughout Districts 106 and 108 were above average.

Coho salmon management in both the District 106 and 108 gillnet fisheries usually commences during late August or early September. During statistical week 35 (Aug 23-29) the management emphasis changed from pink to coho salmon. The coho catches prior to week 35 had been above average, in part due to the large run of fish to Whale Pass (from fry planted into Neck Lake) in Clarence Strait. Threeday/week openings were allowed in both districts from week 35 through week 39 (Aug 23 - Sept 26) and two-day fisheries were allowed during weeks 40 and 41 (Sept 27 - Oct 6). The District 106 fishery was closed after week 41. Prior to the change to coho management, the sockeye and pink salmon fisheries harvested 135,799 coho salmon, or approximately $50 \%$ of the total District 106 coho catch with approximately $37 \%$ of the early coho catch from Alaska hatcheries.

During the 1998 season, the gillnet fishery in District 106 was open for a total of 43 days (Appendix A.5), and in District 108 for 45 days (Appendix A.7). These were above the 1988-1997 averages of 36.6 and 42.5
days, respectively. District 106 fishing effort in numbers of vessels (or permits) was below the average for the first two openings, near or above the average for the next twelve statistical weeks (weeks 28 to 39) and below average for the final two openings (Appendix B.5). The number of vessels fishing in District 108 was below average for the first 5 general openings (not including midweek openings), near or above the average for the next 9 openings (weeks 31 to 39) and below average for week 40 . In District 106, both the greatest number of boats fishing (132) and the greatest number of boat-days (528) was in statistical week 34. The high number of boat-days fished during week 34 was due to the district being open for four consecutive days. The total season effort of 4,398 boat-days in District 106 was $15 \%$ higher than the 19881997 average of 3,798 boat-days. The 1,073 boat-days fished in District 108 was $88 \%$ of the 1988 -1997 average of 1,222 boat-days (Appendix B.7). District 108 effort was lower than average due to the reduced fishing time allowed (from past years) in order to minimize the harvest of Tahltan sockeye salmon.

## Canadian Fisheries

Catches from the combined Canadian commercial and aboriginal gillnet fisheries in the Stikine River in 1998 included: 2,164 large chinook, 423 jack chinook, 43,803 sockeye, 726 coho, 55 pink, 13 chum salmon, and 209 steelhead trout (Appendix A.10, A.12, \& A.13, Figure 4). In addition to these catches, 6,103 sockeye salmon were taken in an ESSR harvest in the Tuya River. The sockeye catch was $13 \%$ above the 1988-1997 average of 38,799 fish, and the steelhead catch was $47 \%$ above average. However, catches of all other species were below average: the catch of large chinook salmon was $95 \%$ of average; jack chinook salmon, $88 \%$ of average; coho salmon, $26 \%$ of average; pink salmon, $20 \%$ of average; and chum salnon, $4 \%$ of average. Weekly commercial and test fishery catches and stock composition estimates for these fisheries are provided in Appendices A.10-A. 16 and annual catches from 1972 to 1998 are provided in Appendices B.13-B.21.

A test fishery was conducted again in the lower Stikine River, just upstream from the Canada/U.S. border. Test fishery catches included: 25 large chinook, 11 jack chinook, 190 sockeye, 207 coho, 20 pink, and 40 chum salmon, and 24 steelhead (Appendix A.15). The test fishery was conducted only on days when the commercial fishery was closed and included ten drifts per day, five in the morning and five in the afternoon. The objectives of the test fishery during the sockeye season were similar to those in previous years: to provide inseason catch, stock ID and effort data for input into the SMM to forecast the inriver run size and to determine migratory timing and stock composition of the sockeye run for use in the postseason estimations of the inriver sockeye and coho run sizes. In addition, the 1998 test fishery was expanded to test the feasibility of live-capturing coho salmon for the purposes of mark-recapture studies.

## Lower Stikine Commercial Fishery

Canadian commercial fishers in the lower Stikine harvested 1,614 large chinook, 328 jack chinook, 37,310 sockeye, 726 coho, 55 pink, 13 chum salmon, and 209 steelhead in 1998 (Appendix A.10). The sockeye catch was $13 \%$ above the 1988-1997 average of 32,887 fish and the catches of large and jack chinook salmon were $19 \%$ and $18 \%$ above their respective averages of 1,353 and 277 chinook salmon (Appendix B.12). Catches of coho, pink, and chum salmon were below average while the steelhead catch was $60 \%$ above the 1988-1997 average of 131 fish.

Figure 4. Catches of chinook, coho, pink, and chum salmon in the combined Canadian fisheries in the Stikine River, 1979-1998.

Weekly guideline harvests, based on forecasts of the total allowable catch (TAC) apportioned by average run timing and domestic and international allocation agreements, were developed each week to guide management decisions during the sockeye season. Management through statistical week 30 was focused primarily on Tahltan sockeye salmon after which it switched to mainstem sockeye stocks through the end of August, and then to coho salmon. The Tahltan sockeye stock was of particular concern given the preseason expectation of a below average run in 1998.

The fishery commenced at noon on Sunday, June 14 (statistical week 25) for a schednled opening of one day. Fishing time was kept to 24 hours due to low numbers of sockeye salmon and a chinook-to-sockeye ratio of approximately $7: 1$. Sockeye abundance increased markedly the following week and the chinook-to-sockeye ratio dropped to $0.2: 1$. Average to above average commercial sockeye catch per unit of effort (CPUE) measured in sockeye/fisher/day and a shortfall in the sockeye catch relative to the weekly guideline harvest prompted a one-day extension over the initial two-day opening posted in week 26. High water conditions persisted throughout the opening making fishing conditions less than ideal due to increased debris loads.

In statistical week 27, the fishery was scheduled to open for three days commencing Sunday, June 28. Test fishery catches just prior to the opening were at least $22 \%$ above average. After three days of fishing, the overall commercial sockeye CPUE was $23 \%$ above average. Final revisions to the SMM had not yet been made; however, a projection of the inriver run of the Tahltan stock was made based on the historical relationship between the cumulative commercial CPUE and the inriver run of Tahltan sockeye salmon. The projection, based on catch hails for the first 24 hours, indicated a guideline cumulative catch of 3,600 Tahltan sockeye salmon through week 27 . Although it was calculated that a fishery opening of five days would be required to meet this target, the fishery was extended for one 24 -hour period. By the end of this week, the catch of Tahltan sockeye salmon in the lower river fishery was approximately 3,400 fish, $9 \%$ below the guideline. At this point in the season, based on inseason data from egg diameter measurements and preliminary otolith analyses, the stock composition of the commercial sockeye catch was approximately $25 \%$ Tahltan stock, $67 \%$ Tuya stock and $8 \%$ mainstem stock.

The fishery opened for three days in week 28 from July 5-8. Sockeye run indicators from the fishery were above average for the first two days of fishing. The overall sockeye CPUE was 155 sockeye/fisher/day, $25 \%$ above the 1988-1997 weekly average; and the CPUE of the Tahltan/Tuya stock grouping, i.e. small egg diameter fish, was $67 \%$ above average. Projections of the inriver run size of the Tahltan stock, based on data collected for the first two days of this week, indicated the cumulative catch of Tahltan fish in the lower river was less than one half what it could have been. The cumulative catch of Tahltan sockeye salmon was approximately 4,900 fish compared to the guideline harvest of 10,400 fish. Similar numbers were generated by the SMM, which became available this week. Although the data indicated an extension was justified, the fishery was not extended due to below average CPUE of Tahltan stock ( $25 \%$ below average) and a sense that the harvestable surplus of Tahltan fish might not be as high as the data suggested.

On July 13, early in week 29, the SMM projections were reviewed and updated by DFO and ADF\&G. The model indicated a balance, i.e. surplus, of 5,100 Tahltan sockeye salmon in the lower river fishery for week 29. With the CPUE of Tahltan sockeye salmon close to average, and a significant shortfall in the total catch relative to guidelines after three days, the fishery was extended by 48 hours over the initial 3 -day opening. The catch for the week of 9,137 sockeye salmon was the peak catch of the season and the third highest on record for this week. The overall sockeye CPUE of 163 sockeye/fisher/day was $43 \%$
above average. The cumulative catch through week 29 was 23,776 sockeye salmon, which was $13 \%$ below the guideline developed by the SMM (from the final model run in week 28). And, the catch of Tahltan fish was $33 \%$ below the guideline for that stock.

The fishery in week 30 was initially opened for three days. Data from the first two days of fishing were used to update the Tahltan sockeye run forecast in the SMM and, as in previous weeks, it indicated the catch and fishing effort were well below guideline levels. For example, the inriver run forecast for the Tahltan stock at this time was 46,700 fish, which translated into a projected inriver harvest of 22,700 fish for the season. Accounting for run timing and projected catches in upper river fisheries, the model indicated there was room for a catch of up to 8,325 Tahltan fish in the lower river for the remainder of the week. Surpluses were also indicated for all other sockeye stocks. These factors lead to an extension of 24 hours in week 30 . The overall sockeye CPUE for this week was $33 \%$ above average, but more importantly, the CPUE of the Tahltan stock was approximately $64 \%$ above average suggesting the Tahltan run timing might be delayed somewhat. According to egg diameter measurements, approximately $60 \%$ of the lower river catch this week was estimated to be of Tahltan/Tuya origin. Late run timing was also indicated by the sockeye catches in the aboriginal fishery near Telegraph Creek, which had continued to increase through week 30 . Normally the sockeye catch peaks in this fishery in week 29 .

The contribution of mainstem sockeye salmon in the lower river catches predominated after week 30 (July 26 on) and the overall sockeye CPUE valnes in the lower river were slightly above average levels for weeks 31 through 34. A one-day extension was provided over the initial three-day opening in week 31, again due to predictions of a growing inriver surplus of sockeye salmon. By the end of week 31, i.e. end of July, it was apparent that the Tahltan weir count was well below target levels, even if the run was late. In response to this concern, the lower river fishery was cut back to two days in week 32. However, the contribution of Tahltan/Tuya stocks dropped to less than $15 \%$ in week 32 and the reduction in fishing effort could do little to increase the escapement of Tahltan sockeye salmon.

The lower river fishery was open for three days per week through the remainder of the sockeye season, i.e. the end of August, and into early September. According to the SMM, weekly fishing times could have been much longer than this to target mainstem sockeye stocks. However, it was felt the model had over-estimated the Tahltan run and there was concern that it might do the same for the mainstem stock. In addition, opportunities to target mainstem sockeye salmon progressively weakened after week 32 when they had peaked.

Declining sockeye catches precipitated the number of fishers dropping from eleven in week 32 to six in weeks 33 through 37. From September 06 (week 37) on, the fishery was left open to provide flexibility for the remaining fishers to harvest coho salmon. Although the fishery was open continuously during weeks 37 to 39 , fishers chose to fish only for three days each week due to low catches of coho salmon. Week 39 was the final week fished. Normally, catches of coho salmon peak during week 36 and/or week 37, i.e. early to mid-September. However, in 1998, there was no apparent strength to the coho run during September. The peak commercial coho catch occurred in week 34 (week ending August 22)

Based on sockeye CPUE in the lower river, the overall sockeye run timing appeared to be normal. The run peaked in week 28 , similar to the average peak in timing over the previous ten years. The timing of the Tahltan/Tuya and mainstem run components was also similar to respective average timing curves. The Tahltan and Tuya stocks peaked over weeks 27 through 30 with the highest CPUE occurring in week 28. Mainstem sockeye CPUE peaked over weeks 29 through 32; the highest CPUE of this stock occurred in week 32. The lower river sockeye catch the lower river sockeye catch was comprised of

12,897 Tahltan fish (accounting for $35 \%$ of the total catch), 13,296 Tuya fish ( $36 \%$ of the catch), and 11,117 mainstem sockeye salmon ( $30 \%$ of the catch) (Table 2).

It became evident by early August that the number of sockeye salmon reaching the Tahltan Lake weir would be less than required for escapement. As a result there was no terminal sockeye harvest at Tahltan Lake in 1998 under an Excess Salmon to Spawning Requirements (ESSR) license. Instead, ESSR fishing activities again focused on the lower Tuya River to harvest sockeye salmon originating from fry plants to Tuya Lake. A total of 6,103 sockeye salmon was harvested in this area.

Thirteen licensed fishers participated in the fishery throughout the season with a maximum of 12 licenses being active in any one week. The total effort in terms of boat-days was $374,95 \%$ of the 1988-1997 average of 395 boat-days. As in 1997, each fisher was allowed the use of two gillnets of which one could be a drift net. A maximum mesh size restriction of 150 mm through July 11 was implemented to reduce the incidental catch of chinook salmon. In 1997, the upstream fishing boundary for the lower river fishery was moved approximately 25 km upstream to Flood River to increase the fishing area over previous years. The same area was fished in 1998.

## Upper Stikine Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. The catch recorded in 1998 included: 12 large chinook salmon, which was $18 \%$ of the 1988-1997 average of 67 large fish, and 907 sockeye salmon, which was $71 \%$ of the 1988-1997 average (Appendices A.12, B.I4). The fishing effort was $50 \%$ of average with an average of only one fisher fishing one to five days per week. A total of 19 days was fished and the total effort amounted to 19 boatdays. For comparison, the 1988-1997 average fishing time was 22.5 days with an average effort of 37.9 boat-days.

## Aboriginal Fishery

The Stikine aboriginal fishery, which is located near Telegraph Creek, harvested 538 large chinook, 95 jack chinook, and 5,586 sockcye salmon (Appendix A.13). The sockeye catch was $20 \%$ above the 1988 1997 average of 4,641 fish. However, the harvest of large chinook salmon was $62 \%$ of the 1988-1997 average of 863 fish and the catch of jack chinook was $52 \%$ of average (Appendix B.15). As in past years, fishing times were not restricted in this fishery.

## Escapement

## Sockeye

A total of 12,658 sockeye salmon was counted through the Tahltan Lake weir in 1998, 37\% of the 19881997 average of 34,285 fish but about the same number as in 1997 (Appendices A.17, B.22). An estimated 850 fish ( $7 \%$ ) originated from the fry planting program, down from $13 \%$ in 1997. The proportion of planted Tahltan sockeye salmon this year is estimated from analysis of otoliths from a random sampling of 390 fish collected at the weir and 500 samples collected from broodstock. Broodstock collected for the fry planting program totaled 3,099 sockeye salmon. This leaves a natural spawning escapement of 9,169 sockeye salmon (Table 2). The escapement is below the escapement goal range of 18,000 to 30,000 fish.

The spawning escapements for the mainstem and the Tuya stock groups are estimated indirectly by computing the ratio of Tahltan fish to mainstem and Tuya components in the total inriver sockeye run. Stock identification data are collected in the lower river commercial and test fisheries. The ratios of Tahltan:mainstem and Tahltan:Tuya are applied to the estimated inriver Tahltan run size to develop an estimate of the total inriver sockeye run. The escapements are estimated by subtracting the inriver catches from the inriver run estimate. The escapement estimates are 19,175 mainstem and 14,634 Tuya sockeye salmon. The mainstem fish spawn in tributaries, lakes, and the mainstem of the Stikine River. The mainstem spawning escapement is below the escapement goal range of 20,000 to 40,000 fish. The Tuya fish are blocked from entering potential spawning grounds of the Tuya tributary by natural barriers and are targeted in the ESSR fishery which caught 6,103 fish in 1998 (Appendix B. 18). The fate of the remaining 8,531 Tuya fish is unknown. Aerial survey counts of sockeye salmon spawning the mainstem index areas totaled 892 fish compared to an average of 911 fish (Appendix B.23).

The Tahltan Lake sockeye smolt outmigration was 540,866 fish in 1998 (Appendix A.18). This represents $53 \%$ of the 1984-1997 average of $1,025,735$ smolt (Appendix B.24).

## Chinook

The chinook escapement was enumerated at the Little Tahltan weir; 4,879 large and 37 jack chinook salmon were counted between June 19 and August 12 with 6 of the large chinook salmon collected for broodstock (Appendices A.19, B.25). The escapement for large chinook salmon was $92 \%$ of the goal of 5,300 fish. Aerial survey index counts of spawning chinook salmon were all below average (Appendix B.26, Figure 5). A chinook salmon mark recapture experiment was conducted in 1998. A total of 403 chinook salmon caught near the mouth of the Stikine River were tagged. Tagged fish were recovered from the Little Tahltan River weir, Verrett Creek, and the Canadian commercial fishery. The total estimated spawning escapement was 25,456 fish. Little Tahltan River chinook salmon accounted for approximately $19 \%$ of the total Stikine River escapement.

## Coho

Test fishery CPUE of coho salmon indicated the inriver run was approximately $73 \%$ lower than the inriver sockeye run. This suggests the total coho escapement was below the interim escapement goal range of 30,000 to 50,000 fish. Aerial surveys of six coho spawning index sites indicated below average spawning escapement with a total count of 1,093 fish compared to an average of 2,771 fish (Appendix B.27).

## Sockeye Run Reconstruction

The estimated Stikine sockeye run is 121,448 fish, of which 35,027 are of Tahltan Lake origin (wild \& planted), 47,383 are of Tuya origin (Tahltan stock planted in Tuya Lake), and 39,039 are mainstem stocks (Table 2). These estimates are based on; scale and otolith recovery and analysis in the U.S. Districts 106 and 108 catches; egg-diameter stock-composition estimates and otolith analysis for inriver catches; Canadian commercial, aboriginal, ESSR, and test fishery catches; and escapement data. The 1998 total run is $64 \%$ of the 1988-1997 average run size and is also below the preseason forecast of 218,500 sockeye salmon.

Table 2. Run reconstruction for Stikine sockeye salmon, 1998.

${ }^{3}$ Escapement into terminal and spawning areas from traditional fisherics.
${ }^{\mathrm{b}}$ Catch allowed in terminal areas under the Excess Salmon to Spawning Requirement license.
${ }^{c}$ Fish returning to the Tuya system are not able to access the lake where they originated duc to velocity barriers.
${ }^{d}$ The number of Tuya lish that should be pass through traditional fisheries in order to harvest the Tuya stock at the same rate as the Tahltan stock to ensure adequate spawning escapement for Tahltan fish.

- Includes traditional, ESSR, and test fishery catches.
${ }^{\text {f }}$ Does not include ESSR or test fishery catches.
${ }^{8}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than in the listed fisheries.

Figure 5. Chinook salmon weir counts and index escapement estimates for major spawning areas and for the entire Stikine River, 1979-1998.

## TAKU RIVER

Taku River salmon are harvested in the U.S. gillnet fishery in the Alaskan District 111, in northern Southeast Alaska seine and troll fisheries, and in the Juneau area sport fishery and inriver personal use fishery (Figure 6). Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an aboriginal fishery, and a sport fishery.

## Harvest Regulations

As with Stikine River issues, efforts to renegotiate harvest shares of Taku River salmon during the Pacific Salmon Commission, government-to-government, and stakeholder negotiations were not successful. As a result, the Parties unilaterally developed the following management plans for the 1998 season:

1. As in 1997, the Canadian management plan did not numerically constrain Canadian harvests of sockeye and coho salmon since provisions to do so had expired in 1992. The basic objective of the management plan for each species was to manage according to the conservation requirements, i.e. escapement goals, for each species. The plan did not permit targeting on chinook salmon in the Taku River since both Parties had previously agreed to rebuild chinook runs by 1995 and the joint assessment of the status of rebuilding efforts has not yet been completed.
2. The U.S. management plan reflected provisions that were in effect for 1993, namely to provide for a U.S. harvest of $82 \%$ of the wild TAC and $50 \%$ of the planted TAC of Taku River sockeye salmon, and for a Canadian inriver harvest of 3,000 coho salmon. Directed drift gillnet fishing on Taku River chinook stocks was not permitted.

## U.S. Fisheries

The 1998 commercial salmon harvests in the District 111 fishery totaled 794 chinook, 69,677 sockeye, 28,713 coho, 168,283 pink, and 296,111 chum salmon (Figure 7). The chinook harvest was the lowest on record and $23 \%$ of the 1988-1997 average. Alaskan hatclery fish contributed approximately $37 \%$ of the harvest or 292 fish as estimated by coded wire tag (CWT) analysis. The sockeye harvest was $60 \%$ of the 1988-1997 average catch of 115,907 fish. The coho catch was $34 \%$ of the 1988-1997 average with an estimated 5,931 hatchery fish harvested or $21 \%$ of the District 111 harvest. The District 111 pink salmon harvest was $20 \%$ above the 1988-1997 average. The summer chum catch of 291,416 fish was $75 \%$ above the 1988-1997 average, and was the third highest on record. The catch of 4,695 fall chum salmon was $25 \%$ of the 1988-1997 average. Weekly commercial fishery catches and stock composition estimates for these fisheries are provided in Appendices C.1-C. 3 and annual catches from 1960 to 1998 are provided in Appendices D.1-D.3. Catches of each species in District 111 consist of fish of mixed stock origin; the contribution of Taku River stocks is estimated only for sockeye salmon.

Figure 6. The Taku River and principal U.S. and Canadian fishing areas.

Figure 7. Average catches and fishing efforts compared with 1998 values for the Alaska District 111 commercial fishery and the Canadian commercial fishery in the Taku River.

The District 111 sockeye harvest included and estimated 6,055 Kuthai ( $9 \%$ ), 11,018 Trapper (16\%), 14,560 Mainstem ( $21 \%$ ), and 17,040 Tatsamenie ( $25 \%$ ) wild fish and 570 Trapper ( $0.8 \%$ ) and 250 Tatsamenie ( $0.4 \%$ ) planted fish for a total Taku River contribution of 49,493 sockeye salmon ( $71 \%$ ) (Figure 8). The remainder of the U.S. gillnet harvest included 1,784 Crescent (3\%) and 500 Speel ( $0.7 \%$ ) wild fish and 17,900 Port Snettisham hatchery fish ( $26 \%$ ). Weekly sockeye catches were below average throughout the season. The percentage of the harvest that occurred in Taku Inlet (Subdistrict 1I1-32) was $68 \%$ of the total catch, compared to the 1988-1997 average of $83 \%$. This was a reflection of the below average Taku sockeye run and the contribution of Snettisham hatchery sockeye salmon to catches in Stephens Passage.

Coho stocks harvested in District 111 include runs to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams as well as Alaska hatchery fish. Runs of pink salmon to the Taku River and streams in Taku Inlet and Stephens Passage were good in 1998, but escapements to District 111 streams to the north of the Taku River were poor. Approximately $51 \%$ of the District 111 pink catch was made in Taku Inlet, followed by $46 \%$ in Stephens Passage (Subdistricts 111-31 and I1 I-20) and 4\% in Port Snettisham. The catch of 296,11 I chum salmon was composed almost entirely ( $98 \%$ ) of summer chum salmon. The summer chum run is considered to last through mid-August (statistical week 33) and is composed of domestic hatchery and wild stocks. Chum salmon returning to DIPAC hatcheries in Gastineau Channel and to the Limestone Inlet remote release site contributed a major portion of the catch but quantitative contribution estimates are not available. Fall chum salmon caught in District 111 are wild fish from the Taku and Whiting Rivers.

The District 111 drift gillnet fishery was open for a total of 48 days from June 21 through September 22, 1998 (Appendix C.1). Fishing time was $5 \%$ above the 1988-1997 average. Fishing effort, as measured by the total number of boats delivering fish each week times the number of days open to fishing, totaled 3,070 boat-days, and was $89 \%$ of the 1988-1997 average.

Three days of fishing were allowed in Taku Inlet during the first three weeks of the season. Catches during these weeks were well below average. Fishing time was limited to two days per week in Taku Inlet during the period July 12-25 because mark-recapture estimates of inriver run size were declining rapidly and U.S. marine harvests were well below average (Table 3). Fishing time was increased to three days per week for the next two weeks due to improved run strength of later-migrating Taku stocks, and to four days of fishing during the final week of the summer fishing season (statistical week 33: August 915).

Fishing time in Stephens Passage south of Circle Point (Subdistrict 111-31) totaled 7 days more than in Taku Inlet during the summer fishing season. Extended fishing time was allowed to target hatchery chum runs to the Limestone Inlet remote release site and Snettisham hatchery sockeye runs. Lower Stephens Passage (Subdistrict 111-20) was open for four days of fishing for each of four weeks between July 26 and August 20 to allow harvest of surplus pink salmon

Port Snettisham was closed to fishing through August 15 to limit harvest rates on Crescent and Speel Lake wild sockeye runs. Portions of Port Snettisham were opened each week beginning August 16. DIPAC counted I3,358 sockeye salmon through a weir they operated on the outlet stream to Speel Lake, the third highest count in 14 years of weir operation at this site. A substantial portion (percentage not available) of the escapement was comprised of fish from Speel brood smolts that had been reared at the Snettisham Hatchery and released into Speel Lake, as evidenced by the recovery of CWT fish in the escapement. The escapement to Crescent Lake was not enumerated through a weir, but a peak aerial
survey count of 5,400 sockeye salmon and on-the-grounds observations during sampling trips indicated escapement was above 1997 levels and important spawning grounds appeared well seeded.

Figure 8. Sockeye catches for the Alaska District 111, the Icy and Chatham Straits, the combined Canadian commercial and food fisheries in the Taku River, and Taku sockeye escapements,

1979-1998.

Coho catches were well below average during each week of the summer fishing season. Coho catches and CPUE remained below average during the fall fishing season as well. Although inriver run strength was also below average during the fall season, projections of escapement from the mark-recapture program indicated the interim escapement goal would be met. The fall fishing season in District 111 lasted six weeks, with weekly fishing time varying between two and three days. The fishing season closed on September 22.

Table 3. U.S. inseason forecasts of total run size, inriver run size, TAC, and U.S. harvest of Taku River sockeye salmon for 1998.

| Statistical | Total Above-border |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: |
| Week | Run | Run | TAC | U.S. | Projected |
| 26 | 113,288 | 81,546 | 38,288 | 31,396 | U.S. Harvest |
| 27 | 187,756 | 146,946 | 112,756 | 92,460 | 30,242 |
| 28 | 119,080 | 83,782 | 44,080 | 36,146 | 39,310 |
| 29 | 113,846 | 81,180 | 38,846 | 31,854 | 33,798 |
| 30 | 121,680 | 91,321 | 46,680 | 38,278 | 31,166 |
| 31 | 125,913 | 88,630 | 50,913 | 41,749 | 28,859 |
| 32 | 137,549 | 97,681 | 62,549 | 51,290 | 35,783 |
| 33 | 145,765 | 103,957 | 70,765 | 58,027 | 38,368 |
| Postscason | 145,559 | 93,728 | 70,559 | 57,858 | 41,887 |

a U.S. TAC calculated as $82 \%$ of the total TAC.
b Postseason U.S. harvest estimate includes inriver personal use harvest.

Several other fisheries in the Juneau area harvested transboundary river stocks in 1998. Estimates of harvest in the U.S. Taku River personal use fishery are 31 chinook, 2,338 sockeye, 174 coho and 464 pink, and 4 chum salmon (Appendix D.4). The spring Juneau-area sport fishery harvested an estimated 2,339 large chinook ( 28 inches or longer) and 208 small chinook salmon. Almost all of the small chinook salmon were hatchery fish taken in terminal areas. Of the large fish, $1,840(79 \%)$ were wild mature, 114 (5\%) were wild immature and 385 ( $16 \%$ ) were hatchery fish (CWT estimate). The spring chinook sport fishery CPUE in the Juneau area was the lowest since 1989. A number of stocks are thought to contribute to the sport fishery, including those from the Taku, Chilkat, and King Salmon rivers, and local hatchery stocks, but the major contributor of mature fish is believed to be the Taku River. The July Hawk Inlet shoreline purse seine fishery north of Point Marsden in Chatham Strait was not opened this year due to poor runs of early migrating pink salmon to the Juneau area.

## Canadian Fisheries

Taku River commercial fishers harvested 1,107 large chinook, 227 jack chinook (fish less than 2.3 kg ), 19,038 sockeye, 5,090 coho, 2 chum and 176 steelhead salmon in 1998 (Appendix C.4). Catches of all species were below average with the exception of steelhead. The catch of large chinook salmon was $67 \%$ of the 1988-1997 average, the catch of jack chinook salmon was $16 \%$ above average, the sockeye catch was $71 \%$ average, and the coho catch was $92 \%$ of average, (Appendix D.5). A total of 42 days was fished, $7 \%$ above the 1988-1997 average. The above average fishing time was reflective of the existence
of a fall fishery, which in many previous years had been curtailed by Treaty restrictions. However, the seasonal fishing effort of 299 boat-days was $87 \%$ of the 1988-1997 average.

The Canadian commercial catch was composed of 4,279 Kuthai (23\%), 3944 wild Trapper ( $21 \%$ ), 533 planted Trapper ( $3 \%$ ), 4,829 mainstem ( $25 \%$ ), 5,397 wild Tatsamenie ( $28 \%$ ), and 56 planted Tatsamenie fish (0.3\%)(Appendices C.5, C.6, D.6)

In addition to the commercial catches, 60 chinook and 237 sockeye salmon were harvested in the aboriginal fishery in 1998. The 1988-1997 average catches in the Taku aboriginal fishery include 53 chinook, 205 sockeye, 86 coho, 1 chum salmon, and 2 steelhead salmon (Appendix D.7). There have been no Canadian test fishery catches since 1993 (Appendix D.8).

The Taku River Tlingit First Nation (TRTFN), in co-operation with DFO, conducted a creel census on the Nakina River in 1998. Data analyses are not yet complete; however, the total harvest appeared to be less than 100 chinook salmon.

The Canadian preseason forecast was for a run of approximately 238,100 sockeye salmon, which was the average of a sibling-based forecast of 223,900 sockeye salmon and a forecast of 252,300 fish based on stock-recruitment data. The point estimate was $2 \%$ above the 1988-1997 average run of 233,307 sockeye salmon. The preseason forecast was used to guide weekly management actions for the first three weeks of the season; thereafter, inseason forecasts based on the joint Canada/U.S mark-recapture program at Canyon Island were used.

The commercial fishery commenced at noon on Sunday, June 14 (statistical week 25) for a scheduled opening of two days and remained open for two days per week through week 26 . The commercial sockeye CPUE was above average in week 26 as were the Canyon Island fishwheel catches but concern over low water levels kept the opening to 48 hours.

Fishing time was increased to three days in week 27, from June 28-30. Commercial sockeye CPUE remained above average and the peak sockeye catch of the season in the Canyon Island stock assessment fishwheels was recorded on June 30. The combined fishwheel catch of 183 sockeye salmon was a record catch for this date and was 2.8 times the 1984-1997 average. Total escapement projections generated at the end of week 27 based on the joint Canada/US Taku mark-recapture program, ranged upward from 117,000 fish, well above the target of 71,000 to 80,000 sockeye salmon.

Based on the apparent above average sockeye run strength in the preceding week, the fishery opened for three days in week 28 from July 05-07. However, a significant decrease in sockeye abundance was noticeable in both the inriver commercial fishery and the Canyon Island fishwheels. The commercial sockeye CPUE dropped to $64 \%$ of the 1988-1997 weekly average value of approximately 81 sockeye/fisher/day, and the Canyon Island fishwheel catches remained well below long term daily averages for all but one day during this week. The low inriver sockeye abundance resulted in a sharp decrease in the projected escapement, which dropped to a range of 67,800 to 109,200 fish (Table 4).

Below average run indicators and declining escapement projections in week 28 prompted a reduction in fishing time in week 29 to 48 hours. Although the commercial sockeye CPUE increased to approximately 80 sockeye/boat/day, it was still $20 \%$ below average. Canyon Island fishwheel catches also improved marginally but were mostly below daily averages.

With no improvement in the escapement forecast in week 29, the fishery opening the following week remained at two days. The sockeye catch rate in the commercial fishery reached the highest level of the season in week 30, i.e. 145 sockeye/fisher/day compared to an average value of $112 \mathrm{~s} / \mathrm{f} / \mathrm{d}$. Fishing time was not extended in week 30 due to concerns over escapement and the continued below average fishwheel catches at Canyon Island.

The above average commercial sockeye CPUE observed in week 30 was not sustained in week 31 . With a CPUE $40 \%$ below average, the fishery was closed after two days of fishing (July 26-28). Forecasts produced at the end of this week indicated a total escapement projection of 81,000 to 96,000 sockeye salmon. The Tulsequah flood occurred at the end of week 31 and the high water and debris loading hampered fishing conditions for first day of fishing in week 32. Although the opening was initially posted for two days, fishing time was extended by 36 hours in response to above average sockeye and coho CPUE and the improved sockeye escapement outlook from the previous week. Catches of both sockeye and coho salmon peaked during this opening.

Sockeye catches decreased sharply in week 33 prompting a fishery closure after 48 hours. The commercial CPUE dropped to $25 \%$ below average; Canyon Island fishwheel catches were also below average. After week 33, the commercial sockeye CPUE continued to be below average. The final inseason forecast, computed in week 35, indicated a total run size of 160,500 to 164,200 fish and a projected total escapement of 74,400 to 76,100 sockeye salmon (Table 4).

Table 4. Canadian inseason forecasts of total run size, total allowable catch (TAC), and spawning escapement of Taku sockeye salmon, I998.

|  | Total Run |  |  | TAC |  |  | Escapement |  |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Week | Lower | Upper |  | Lower | Upper |  | Lower | Upper |
| 25 | 238,100 | 238,100 |  | 163,100 | 163,100 |  | 71,000 | 80,000 |
| 26 | 238,100 | 238,100 |  | 163,100 | 163,100 |  | 71,000 | 80,000 |
| 27 | 156,383 | 308,800 |  | 81,383 | 233,800 |  | 177,012 | 230,928 |
| 28 | 109,506 | 176,359 |  | 34,506 | 101,359 |  | 67,797 | 109,186 |
| 29 | 114,248 | 160,298 |  | 39,248 | 85,298 |  | 69,931 | 98,118 |
| 30 | 135,694 | 179,202 |  | 60,694 | 104,202 |  | 80,561 | 106,392 |
| 31 | 133,635 | 162,087 |  | 58,635 | 87,087 |  | 76,547 | 92,845 |
| 32 | 159,772 | 190,087 |  | 84,772 | 115,087 |  | 80,808 | 96,140 |
| 33 | 158,159 | 188,168 |  | 83,159 | 113,168 |  | 81,588 | 90,756 |
| 34 | 159,446 | 167,057 |  | 84,446 | 92,057 |  | 74,726 | 78,294 |
| 35 | 160,451 | 164,208 |  | 85,451 | 89,208 |  | 74,359 | 76,100 |

The cumulative commercial sockeye CPUE over the season from week 26 to week 40 totaled 730 sockeye/fisher/day, $11 \%$ below the1988-1997 average of 823 sockeye/fisher/day. Run timing appeared to be normal in 1998. Three distinct peaks occurred in the fishery, one in week 27, the largest in week 30 , and a final peak in week 32.

Fishing times increased to 2.5 days in week 34 , 3 days in week 35 and 4 days in week 36 to target coho salmon. During these three weeks, the number of fishers declined from twelve fishers in week 34, to four fishers in week 36. Weekly coho catches were below average and although the coho price was up over recent years, volumes were uneconomic for most fishers and buyers. No one fished in week 37 due to the lack of a buyer on the river. Thereafter through the end of the season, fishing time was increased to seven days/week commencing statistical week 38 (September 13-19) to provide incentive and
flexibility for the remaining fisher to fish coho salmon. Both DFO and ADF\&G wished to have some fishing effort present in the river to provide crucial information regarding the inriver run size of Taku coho salmon. Although the fishery was open continuously, the number of days fished in weeks 38 to 40 declined from seven days in week 38 , to three days in week 39 and one day in week 40.

The total season catch of coho salmon was 5,090 fish, $91 \%$ of the 1988-1997 average of 5,582 fish and the cumulative coho CPUE through week 40 was $85 \%$ of average. Run timing appeared to be normal. The strength of the early part of the run, through week 33, appeared to be above average, whereas, after the middle of August, run strength appeared to be average to below average.

Inriver coho run forecasts were generated through week 35 and ranged from 47,000 in week 34 , to 57,000 in week 33 . Escapement projections associated with the forecasts all exceeded the upper end of the interim escapement goal range of 27,500 to 35,000 coho salmon.

As in recent years, both set and drift gill netting techniques were utilized with the majority of the catch taken in drift gillnets. Mesh sizes were restricted to less than 150 m through July 12 to minimize the incidental catch of chinook salmon. In addition to the gillnets, one fishwheel was in operation.

## Escapement

## Sockeye

Spawning escapement of sockeye salmon in the Canadian portion of the Taku River drainage is estimated from the joint Canada/U.S. mark-recapture program. Counting weirs operated by DFO at Little Trapper and Tatsamenie Lakes provide information on the distribution and abundance of discrete spawning stocks within the watershed. Additional sockeye enumeration programs were conducted at Kuthai Lake and the Nahlin River by the TRTFN in 1998.

A mark-recapture program has been operated annually from 1984 to 1998 to estimate the above-border run size (Appendices C.7, D.9). Spawning escapement may then be estimated by subtracting the inriver catch. The 1998 estimate of the border run is 93,728 sockeye salmon and the spawning escapement is estimated at 74,453 fish (Table 5). This spawning escapement is $73 \%$ of the 1987-I998 average (Appendix D.9), but is within the interim escapement goal range of 71,000 to 80,000 sockeye salmon.

The escapement through the Little Trapper Lake weir was 8,717 sockeye salmon, $72 \%$ of 1988-1997 average (Appendices C.9, D.10). Prior to 1995, weir counts for the Tatsamenie system were made at Little Tatsamenie Lake and included fish which spawn between Little Tatsamenie and Tatsamenie Lakes as well as fish which spawn in Tatsamenie Lake and its outlet stream. In 1995 the weir was moved upstream to Tatsamenie Lake. The escapement count through the Tatsamenie Lake weir in 1998 was 5,997 sockeye salmon (Appendix C.8). To be comparable with earlier spawning estimates, it needed to be expanded to represent the entire Tatsamenie system. In 1994 weirs were operated at both Little Tatsamenie and Tatsamenie Lakes; approximately $40 \%$ of the fish counted at the Little Tatsamenie weir did not migrate as far as the upper weir site at Tatsamenie Lake. Since this was from only one year and appears to be high, the upper Tatsamenie estimate was expanded by $1 / 0.8$ rather than $1 / 0.6$. The resulting escapement to the entire Tatsamenie system, is 7,496 fish. A total of 1,262 sockeye salmon was taken for brood stock leaving a spawning escapement of 6,234 sockeye salmon for 1998. ). The sockeye count through the Nahlin weir was 345 fish (Appendix C.10), the third lowest since counts were started in 1988 and $19 \%$ of the average. The sockeye count through the Kuthai Lake weir was 1,934 fish
(Appendix C11), the second lowest recorded in the 1992-1997 period for the weir and $44 \%$ of the average count (Appendix D.10).

## Chinook

Aerial surveys of large chinook salmon (three-ocean and larger) to the six escapement index areas annually surveyed by ADF\&G were as follows: Nakina, 2,720 fish; Kowatua, 473 fish; Tatsamenie, 675 fish; Dudidontu, 807 fish; Tseta, 360 fish; and Nahlin, 1,260 fish (Appendix D.11, Figure 9). The total of 6,295 large chinook salmon observed was $54 \%$ of the 1988-1997 average and the lowest recorded during that period. The interim index escapement goal for the combined six index areas of the Taku drainage is 13,200 large chinook salmon. A total of 1,448 chinook salmon was counted through the Nahlin River weir (Appendix C.10). The number of chinook carcasses counted at the Nakina River weir in 1998 was 656 fish, a poor showing of 137 females was observed (Appendix C.12). A chinook markrecapture study was again conducted in 1998. The estimated above border escapement was 31,039 large chinook salmon.

## Coho

Spawning escapement of coho salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. mark-recapture program. Tag application and tag recovery occurred though statistical week 40 (September 27 to October 3). The above border run was estimated to be 66,472 fish and the spawning escapement was estimated at 61,382 fish (Appendices C.7, D.12). The spawning escapement is $87 \%$ of the 1988-1997 average but is above the interim escapement goal of 27,500 to 35,000 coho salmon. Escapement counts to other Taku spawning locations were below average (Appendix D.13).

## Pink

A total of 23,347 pink salmon was counted at the Canyon Island fish wheels in 1998 (Appendix D.14), which is $69 \%$ above the 1988-1997 average. There was no program in place to estimate the escapement of pink salmon to the Taku River in 1998.

## Chum

There was no program in place to estimate the system-wide escapement of Taku chum salmon. Low catch and CPUE information from the Canyon Island fish wheels and inriver commercial fishery (Appendix D.5) indicated that there was a below average chum run in 1998. A total of 179 chum salmon were captured in the fish wheels, which is $32 \%$ of the 1988-1997 average (Appendix D.14).

The Taku River fall chum run has continually declined since 1989. It is unlikely that the spawning escapement goal of 50,000 to 80,000 chum salmon was achieved.

## Steelhead

There was no program in place to estimate the system-wide Taku steelhead escapement. An escapement goal has not been set for this species.

Figure 9. Taku River chinook index escapement counts, 1975-1998.

## Sockeye Run Reconstruction

The harvest of 48,673 wild Taku sockeye salmon in the District 111 fishery (Table 5) was estimated with scale pattern and brain parasite analysis. The estimate of 570 planted Trapper Lake and 250 planted Tatsamenie Lake sockeye salmon in the District 111 catch was based on expansion of thermally marked sockeye recovered in District 111 fishery samples. An additional 2,338 sockeye salmon were estimated to have been harvested in the U.S. inriver personal use fishery. The estimated total U.S. harvest of Taku sockeye salmon is 51,831 fish (Table 5).

The preliminary estimate of the magnitude of the above-border sockeye run in 1998, based on the joint Canada/U.S. mark-recapture program, was 93,728 fish. Subtracting the Canadian inriver catch of 19,275 sockeye salmon in the commercial and aboriginal fisheries from the border run estimate results in a border escapement estimate of 74,453 fish.

The run size, estimated by summing the U.S. harvest and the border run, was 145,559 sockeye salmon, $62 \%$ of the 1988-1997 average (Appendix D.9). Based on the escapement goal range of 71,000 to 80,000 fish, the TAC was 65,559 to 74,559 sockeye salmon, of which the U.S. harvested $70 \%$ to $79 \%$ and Canada harvested $26 \%$ to $29 \%$ (Table 5). The overall exploitation rate was estimated to be $49 \%$ in 1998 .

Table 5. Taku sockeye salmon run reconstruction, 1998. Estimates do not include spawning escapements below the U.S./Canada border or Taku sockeye salmon harvested in marine areas outside District 111.

#### Abstract

ALSEK RIVER Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 10). Unknown quantities of Alsek origin fish are also taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 10).

## Harvest Regulations \& Management Objectives

Although catch sharing of Alsek salmon stocks between Canada and the U.S. has not been specified, Annex IV does call for a cooperative attempt to rebuild depressed chinook and early-run sockeye stocks. Interim escapement goal ranges for Alsek sockeye and coho salmon were initially set by the TTC at 33,000 to 58,000 sockeye salmon, and 5,400 to 25,000 coho salmon. However, stock assessment projects to determine system-wide escapements have not yet been developed. Instead, the principle escapement monitoring tool for chinook, sockeye, and coho stocks on the Alsek River is the Klukshu weir, operated by DFO and the Champagne-Aishihik First Nation. The weir is dismantled during the coho run, and thus does not represent a total count of coho escapement into the river. The weir has been in operation since 1976. To make the management objectives of chinook and sockeye salmon better defined in terms of Klukshu stocks, revised goals, expressed in terms of Klukshu stocks only, were tentatively established for 1998.

The initiative to establish a specific Klukshu chinook spawning escapement goal began in 1991 when the TTC set an interim spawning objective of 4,700 Klukshu chinook salmon. This goal was based more on manager's intuition than on science. From 1995 through 1997, the TTC reviewed this escapement level and concluded that goal of 4,700 chinook salmon was not supported by the data. A new goal of 1,100 to 2,300 chinook salmon was proposed based on joint analyses of stock-recruitment data. The Parties conducted independent internal reviews of the analyses. Although there was not unanimous support for the proposal, there was agreement on establishing a minimum goal consistent with the lower end of the proposed range. As a result, Canadian and U.S. managers agreed to a minimum spawning escapement goal of 1,100 chinook salmon for the Klukshu system for the 1998 season. Recognizing that some harvesting would occur upstream from the weir, managers also agreed to establish a minimum weir count objective of I,500 chinook salmon for 1998.

The stock-recruitment analyses of Klukshu sockeye data have not yet been completed nor has it undergone internal peer review. The analysis is following the same general methodology as was used for the chinook data. Analyses conducted by the TTC prior to the 1998 season resulted in establishing the following interim management objectives for 1998: a) for the early sockeye run, i.e. sockeye salmon migrating through the weir prior to August 15 , a minimum spawning goal of 2,000 sockeye salmon; and b) for the late run, the minimum goal of 8,500 was established. Minimum weir count objectives were 4,000 early, and 11,500 late, run sockeye salmon. These targets were to be considered interim only and subject to further revision upon completion of the analyses and peer review.

Figure 10. The Alsek River and principal Canadian aboriginal and sport fishing areas.

## Preseason Forecasts

Based on the above average parent-year early-run (<August 15) sockeye escapements to the Klukshu River in 1993 ( 5,200 sockeye salmon) and 1994 ( 3,000 sockeye salmon), an above average early sockeye run was expected in 1998. The late run escapements in $1993(9,400$ sockeye salmon) and 1994 ( 10,400 sockeye salmon), although below average, were close to the optimum level as determined from preliminary stockrecruitment analysis. As a result, the late run was also expected to return at above average levels.

Klukshu chinook escapements in 1993 and 1994, 3,200 and 3,600 fish, respectively, were above average. However, the escapements were also above the optimum escapement range of 1,100 to 2,300 chinook salmon as determined from stock-recruitment analysis. As a result, the chinook run to the Alsek River was expected to be average to slightly below average.

The coho escapements observed at the Klukshu River in 1994 ( 1,200 coho salmon) and 1995 ( 3,600 coho salmon) suggested the run in 1998 would be about average. The 1988-1997 average weir count was 2,400 coho salmon.

## U.S. Fisheries

The Dry Bay commercial set gillnet fishery harvested 550 chinook, 15,007 sockeye, 4,925 coho, 1 pink, and 145 chum salmon (Appendix E.1, Figure 11). The chinook harvest was $36 \%$ of the 1988-1997 average of 405 fish. The sockeye harvest was $80 \%$ of the average of 18,751 fish and the coho harvest was $85 \%$ of the average of 5,799 fish. The fishery was open for 41 days, $89 \%$ of the $1988-1997$ average (Appendix E.4). The majority of fishing time ( 23 days) occurred late in the season (late August through early October) after the sockeye run had largely passed through the fishery. The total effort expended in the fishery was 399 boat-days, $84 \%$ of the 1988-1997 average.

The Alsek River was opened to commercial fishing during statistical week 23, the first Monday in June (June 1). The initial opening was limited to 24 hours in order to evaluate chinook and sockeye run strengths. Fishery performance indicated that the chinook and sockeye harvests were below expected levels and fishing time was not extended. The CPUE was below average during the second week of the season and fishing time was again limited to 24 hours. Fishing time remained at 24 hours during the third week (statistical week 25 ; June 14-20) of the season because CPUE remained below average. Fishing time was increased to 72 hours for statistical weeks 26 and 27,24 hours for week 28 , and 48 hours for week 29. Due to below average sockeye escapement at the Klukshu weir fishing periods were limited to 24 hours for weeks 30 through 35 even though CPUE was well above average for some of those weeks.

Historically, a set gillnet fishery targeting on chinook salmon was conducted during May and early-June. Due to depressed runs, the directed fishery has been closed since 1962 and chinook salmon have only been harvested incidentally during the sockeye fishery in early June. From 1962 through 1997, the early June periods were limited in time in order to reduce the impact on chinook salmon. With the advent of the new chinook escapement goal concern for incidentally caught chinook salmon has diminished so the management of the early June periods was based on sockeye CPUE. Gillnet mesh size was restricted to a maximum of six inches through July 1. Approximately $84 \%$ of the chinook catch ( 462 fish), was taken during the first three weeks of the season.

Figure 11. Average catches and fishing efforts compared with 1998 values for the U.S. Alsek River commercial fishery and the Canadian aboriginal and sport fisheries in the Alsek River.

The majority of the Alsek sockeye harvest ( $80 \%, 12,098$ fish) was taken in the river, with the remainder of the catch coming from the surf area. Adjustments to the weekly fishing periods during the sockeye season relied heavily on fishery performance data; the decision of whether or not to extend any given period was initially based on catch and CPUE figures gathered inseason during that particular period. From week 30 through 35 management was based on Klukshu weir sockeye counts. The Alsek management model was not used this year as a management tool because of unreliable run estimates produced in recent years. The management model had used multiple regression analysis of fishery catch and effort data to generate weekly projections of the U.S. Alsek River catch, the Klukshu River escapement, and total index run size (U.S. catch + Klukshu weir count). Model results tended to get more accurate as the season progressed; early season projections were of limited use for management purposes. In 1996 and 1997, model projections were inaccurate and resulted in underestimates of catch and overestimates of escapement.

The coho escapement at Klukshu weir was well above average early in the season and fishing periods ranged from 3 to 5 days during weeks 35 through 41 . Effort was minimal during the weeks 40 and 41 due to the closure of Sitka Sound Seafood's processing plant in Dry Bay.

## Canadian Fisheries

The aboriginal fishery harvested an estimated 154 chinook, 567 sockeye, and 72 coho salmon. The chinook catch was $54 \%$ of the 1988-1997 average and the sockeye catch $32 \%$ of average and the second lowest on record. The coho catch was 4.7 times the 1988-1997 average. Weekly catches and annual comparisons appear in Appendices E.2, E.6.

Catches in the recreational fishery were also below average with an estimated 175 chinook, 18 sockeye, and 40 coho salmon harvested. The chinook catch was $45 \%$ of the 1988-1997 average, the sockeye catch was $5 \%$ of average and the lowest on record, and the coho catch was $25 \%$ of average. The catch data was derived from a creel census program conducted in the Dalton Post area by the Klukshu weir personnel. Weekly estimates and annual comparisons are listed in Appendices E.2, E.6.

Management of salmon in the Yukon is a shared responsibility between the Department of Fisheries and Oceans Canada (DFO) and the Yukon Salmon Committee (YSC). The YSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Govermment of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two Champagne-Aishihik First Nation (CAFN) members sit on the YSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

The 1998 Alsek-Tatshenshini management plan, adopted by CAFN, YSC, and DFO, was based on the objectives described in the Harvest Regulations \& Management Objectives section above. For chinook and early sockeye management, the status of the Klukshu weir counts was to be reviewed on July 15 to ensure weir and spawning escapement targets were on track. The status of the late sockeye run would be reviewed at the end of August. Adjustments to inseason fishing regimes in the sport and aboriginal fisheries would be made if deemed necessary. Other key elements of the plan are described below.

The centre of aboriginal fishing activity in the Alsek drainage occurs at the Champagne/Aishihik First Nation village of Klukshu, on the Haines Road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff and traditional fish traps as the fish migrate up the Klukshu River into Klukshu Lake. Gaff fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The fishing plan for the aboriginal fishery for the period prior to August 15 allowed fishing by means of fish traps for 2 days per week. After August 15, it was planned that the traps would be fished 3 days per week. The plan did not restrict the gaff fishery other than to reserve Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the sport fishing effort on this drainage occurs on the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 to protect early runs. The chinook daily catch limit was two fish, only one of which could be over 45 cm . The overall possession limit for salmon was four, of which only two could be chinook salmon greater than 45 cm in length. Sport fishing in the Dalton Post area was initially to be open from 6:00 am Saturday to 12:00 noon Tuesday each week. Headwater areas upstream of the British Columbia/Yukon border were to be closed for the season to protect spawning chinook salmon.

The stock status review conducted on July 15 raised conservation concerns for both chinook and early sockeye salmon: the chinook count to date was $78 \%$ below average and the sockeye count was $97 \%$ below average. Projections, based on weir counts to date and historic timing data, suggested that the weir objectives for chinook and early run sockeye salmon were not likely to be achieved. However, projections made in mid-July are very sensitive to run timing. There was some indication from the Alsek-Tatshenshini chinook radio telemetry project that the chinook run timing was late. All but one of the radio tagged fish were distributed in the Tatshenshini River downstream from the Klukshu River. It was decided that a further review would be conducted on July 22 to see if the runs improved.

By July 21, the weir counts had shown only marginal improvements over the previous week. Chinook and sockeye numbers were still $77 \%$ and $95 \%$ below respective long-term averages. Projected weir counts for the season continued to fall below the minimum targets established in the management plan. As a result, the salmon sport fishery at Dalton Post was closed at noon July 21. This was followed by a complete closure of sport fishing in the Tatshenshini drainage effective 0600 h July 25 . The sport fishing closure remained in effect through September 18. On September 19, a limited sport fishery was opened to target coho salmon for two days/week in the Tatshenshini River upstream from its confluence with the Klukshu River. On September 26, this area was opened seven days per week and on October 16, the Tatshenshini River was opened downstream from its confluence with the Klukshu River.

CAFN also imposed significant closures in the aboriginal fishery. On July 24, the lower Klukshu River was closed downstream of the weir and fishing time for sockeye salmon upstream from the weir was restricted to two days per week. On July 31, the CAFN voluntarily agreed to close all fishing in the Klukshu River and the sockeye fishery in Village Creek was reduced to two days/week. This closure remained in effect through September 17. On September 18, the aboriginal fishery opened in all areas for seven days/week for coho salmon. A voluntary closure on sockeye salmon in the Klukshu River was still in effect. Commencing September 25, the sockeye fishery in the Klukshu was open three days/week. The closures in the aboriginal fishery seriously impacted CAFN fishers in 1998.

## Escapement

It is currently not possible to accurately assess whether the system-wide escapement goals for Alsek chinook, sockeye, and coho salmon are being met because total drainage enumeration programs are not established. A large, but unknown, and presumably variable proportion of the escapement of each species is enumerated at the weir on the Klukshu River (Appendices E.3, E.7, Figures 12-14). Current escapement monitoring programs including the Klukshu weir, Village Creek electronic counter, and aerial surveys do, however, allow annual comparisons of escapement indices (Appendices E.8-E.10). The most reliable comparative escapement index for Alsek drainage salmon stocks is the Klukshu River weir count

## Sockeye

The 1998 weir count and escapements of Klukshu sockeye salmon were 13,591 and 13,580 fish, respectively (Table 6). The early-run (count through August 15) of 597 fish was $16 \%$ of the 1988-1997 average of 3,754 fish and the late-run count of 12,994 fish was $98 \%$ of the average of 13,238 sockeye salmon (Appendix E.7). The estimated Village Creek sockeye escapement was 826 fish, which is $17 \%$ of the 1988-1997 average of 4,932 fish (Appendix E.8). A count of 110 sockeye salmon in the Tanis River was below the 1988-1997 average of 893 fish (Appendix E.8). No other streams on the U.S. side of the border were surveyed for sockeye salmon in 1998.

## Chinook

The chinook count and escapements at Klukshu weir were 1,364 and 1,347 fish, respectively and were $46 \%$ and $47 \%$ of the 1988-1997 averages (Figure 13, Appendix E.7). The 1998 count was within the revised interim escapement goal of 1,100 to 2,300 Klukshu chinook salmon. The aerial survey count of 136 chinook salmon in the Takhanne River was $62 \%$ of the 1988-1997 average of 220 fish. An aerial count of 79 chinook salmon at the Blanchard River was $32 \%$ of the average of 244 chinook salmon. A total of 39 chinook salmon was observed at Goat Creek, $2 \%$ above the average of 38 fish. (Appendix E.9). An aerial survey count of Klukshu chinook salmon was not conducted in 1998. A chinook salmon mark recapture experiment was conducted in 1998. A total of 307 chinook salmon caught near the mouth of the Alsek River were tagged. Tagged fish were recovered from the Klukshu River weir, Blanchard River, and Goat Creek. The total estimated spawning escapement was 20,200 fish. Klukshu chinook salmon accounted for approximately $19 \%$ of the total Alsek escapement

## Coho

The Klukshu weir count of 1,961 coho salmon (Table 6) was $80 \%$ of the 1988-1997 average count of 2,440 fish (Table 6, Appendix E.7). The weir is removed prior to the completion of the coho run and does not include fish that migrate after mid-October. (Figure 14, Appendix E.10). Poor weather conditions hampered aerial surveys of U.S. tributaries and made it impossible to obtain accurate escapement counts for the streams.

Figure 12. Alsek sockeye catches and weir counts, 1979-1998

Figure 13. Alsek chinook catches and weir counts, 1979-1998.

Figure 14. Alsek coho catches and weir counts, 1979-1998.

## Run Reconstruction

Estimates of the Klukshu contribution to the sockeye runs in the Alsek drainage vary from $37 \%$, as estimated from an ADF\&G mark-recapture study in 1983, to $60 \%$, based on Canadian fishery managers' professional judgment. The Klukshu weir count divided by the estimated proportion of Klukshu fish that constitute the total Alsek run, minus the recreational and aboriginal fishery catches yields an escapement estimate for the Alsek River. The estimated escapement added to the U.S. commercial and subsistence catches yields an estimate of the entire Alsek run. Using the $37 \%$ to $60 \%$ contribution range, the estimated sockeye salmon escapement in the Alsek River was on the order of 22,300 (Canada) to 36,200 (U.S.) fish and the estimated Alsek sockeye run was on the order of 37,400 (Canada) to 51,300 (U.S.) sockeye salmon. The sockeye escapement estimate falls at or below the sockeye escapement goal range of from 33,000 (U.S.) to 58,000 (Canada) for the Alsek River.

Table 6. Catch and Klukshu index escapement data for Alsek sockeye, chinook, and coho salmon for 1998.

|  | Sockeye | Chinook | Coho |
| :--- | :---: | ---: | ---: |
| Escapement Index ${ }^{\text {a }}$ |  |  |  |

| are made for catches other than the listed fisherics. |  |  |  |

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 1998, sockeye eggs were collected at Tahltan Lake on the Stikine River for the tenth year, and in the Tatsamenie Lake system on the Taku River, for the ninth year. No eggs have been collected at Little Trapper Lake on the Taku River since 1994.

## Tahltan Lake: Target 6.0 million eggs

The Tahltan egg collection was contracted to Arc Environmental Ltd. for the third consecutive year. Lower than average escapement in 1998 made capture of brood stock relatively difficult in comparison with previous years that had higher escapement levels. An estimated 4.3 million eggs were collected from 1,311 females. A similar number of inales were taken. The brood stock was collected by beach seine at the major spawning site as has been done in previous years.

## Tatsamenie Lake: Target 5.0 million eggs

Egg collection was again contracted to B. Mercer and Associates Ltd. An estimated 2.4 million eggs were collected from 623 females and a total of 535 males was spawned. The low Tatsamenie escapement in 1998 limited the availability of brood stock. A 1:1 spawning ratio was not possible due to fewer males than females collected for brood stock. The brood stock was captured at an adult enumeration weir that was located on the outlet of Tatsamenie Lake. This was the fifth year that all of the Tatsamenie brood stock were captured at this location. No significant problems were encountered during the course of brood stock collection

## Incubation and Fry Plants (1997 Brood Year)

Incubation of 1997 brood eggs took place at Snettisham Hatchery and the resultant fry were transported to the appropriate systems from June 7 to June 29, 1998. The IHN virus was detected in one incubator that contained Tatsamenie fry and an estimated 178,577 fry died or were destroyed. The hatchery manager had observed behavior of pre-emergent fry indicative of IHN virus and made the decision to destroy those incubators of fish; the ADF\&G pathology lab later confirmed the presence of the virus.

## Tahltan Lake

A total of 1.9 million fry from the 1997 Tahltan sockeye egg take was planted back into Tahitan Lake in 1998 (Table 6). Survival from green-egg to outplanted-fry was $82 \%$. Fry outplanting took place from June 7 through June 13.

## Tuya Lake

A total of 433,000 fry from the 1997 Tahltan sockeye egg take were planted into Tuya Lake in 1998 (Table 6). Survival from green-egg to outplanted-fry was $91 \%$. Fry outplanting took place on June 26.

## Tatsamenie Lake

A total of 3.6 million fry from the 1997 egg-take were planted into Tatsamenie Lake in 1998 (Table 7). Survival from green-egg to outplanted-fry was $77 \%$. IHNV was detected in one incubator and 178,577 fry died or were destroyed. Outplanting took place from June 15 through June 29.

Table 7. Summary of sockeye salmon fry releases to transboundary river systems.

|  | Fry Destination |  |  |  |
| :--- | ---: | ---: | ---: | ---: |
| Brood Year | Tahltan Lake | Tuya Lake | Trapper Lake | Tatsamenie Lake |
| 1989 | $1,042,000$ | 0 | 0 | 0 |
| 1990 | $3,600,000$ | 0 | 934,000 | 673,000 |
| 1991 | $1,400,000$ | $1,600,000$ | $1,800,000$ | $1,200,000$ |
| 1992 | $1,900,000$ | $2,000,000$ | $1,100,000$ | 909,000 |
| 1993 | 904,000 | $4,700,000$ | 916,000 | 521,000 |
| 1994 | $1,100,000$ | $2,300,000$ | 773,000 | 898,000 |
| 1995 | $2,300,000$ | $2,500,000$ | 0 | $1,700,000$ |
| 1996 | $2,200,000$ | $2,600,000$ | 0 | $3,900,000$ |
| 1997 | $1,900,000$ | 433,000 | 0 | $3,600,000$ |

## Outplant Evaluation Surveys

## Acoustic and Trawl, Beach seine and Limnological Sampling

In 1998, surveys continued to be directed by the Salmon Indexing Methods Unit of the Stock Assessment Division of Fisheries and Oceans, Canada. Limnological beach seine surveys were conducted at Tahltan, Tatsamenie, and Tuya Lakes by B. Mercer \& Associates Ltd.; acoustic and trawl surveys were conducted at Tatsamenie, and Tuya Lakes by Mercer \& Associates Ltd. The limnetic population estimates are based on the soundings and trawl samples only; beach seine catches are not used. Currently, beach seine catches serve as a qualitative index of the abundance of fish in the littoral zone, which cannot be sampled by the acoustic and trawl gear. Density estimates are made from the sounding transects. Each lake is divided into a number of transects and each transect is further divided into a number of depth strata. Limnetic fish population (rounded to the nearest 100,000 ) and density estimates and beach seine catches are presented in Table 8.

## Smolt Enumeration and Sampling

Smolt sampling and enumeration programs were conducted at Tahltan and Tatsamenie Lakes. Sampling only, was conducted at Tuya Lake. Sampling and enumeration at Tahltan Lake was conducted by DFO, Whitehorse, as part of their continuing smolt program. B. Mercer and Associates, on contract to DFO, performed the work at Tatsamenie and Tuya Lakes.

## Tahlitan Lake

Sampling and enumeration at Tahltan Lake was conducted from May 10 to June 29. Of the 694 smolts captured for sampling, a total of 682 were sampled and the heads preserved for thermal mark analysis. The overall age composition of the smolts captured was $92 \%$ age $1+$ and $8 \%$ age $2+$ based on the scale age analysis (Table 9). Average lengths and weights were 84.4 mm and 103.3 mm , and 4.6 g and 8.5 g for age $1+$ and age $2+$ fish, respectively.

The Tahitan smolt enumeration program uses a fence and modified inclined plane traps to capture all emigrating smolts. Volumetric displacement techniques are employed to determine the total smolt run size. The 1998 smolt outmigration was estimated to be 540,866 fish, ( 498,140 age $1+$ and 42,726 age $2+$ ) of which an estimated 214,446 fish originated from the fry planting program.

## Tatsamenie Lake

Capture of smolts for sampling as well as for obtaining mark-recapture estimates was conducted from May 15 through June 30 using a fyke net, with attached wing nets. Of the 147,754 smolts captured, a total of 475 were retained for sampling and the heads preserved for thermal mark analysis. The overall age composition of the smolts captured was $97 \%$ age $1+$ and $2.7 \%$ age $2+$ based on length frequency analysis (Table 9). Average lengths and weights were 77.1 mm and 110.1 mm , and 3.8 g and 10.7 g for age 1+ and age $2+$, respectively. Of the 475 otoliths examined, 71 (15\%) were thermally marked.

The 1998 Tatsamenie smolt emigration was estimated using mark-recapture techniques. Smolt abundance was estimated (using Darroch estimator) to be 2,290,711 (95\% CI 1,981,736 to 2,599,691) with a planted component of 354,406 smolts. An undetermined portion of the run occurred prior to the start of the mark-recapture program.

## Tuya Lake

In 1998, emigrating smolts were captured with a fyke net from June 4 to June 9. Of the approximately 360 smolts captured, a total of 242 were retained for length, weight, and scale samples. The heads from 85 of the sampled smolts were preserved for otolith analysis, although it is assumed all smolts originated from fry plants. Based on length-frequency analysis, the overall age composition was $94 \%$ age $1+$, and $6 \%$ age $2+$ (Table 8). Average length and weight were 103.4 mm and 140.4 mm , and 10.1 g and 25.1 g for age $1+$ and age $2+$, respectively.

## Trapper and Little Trapper Lakes

These lakes were not sampled in 1998.

## Short Term Fry Holding and Feeding Studies

Short term pen holding studies were conducted at Tahltan and Tatsamenie Lakes. The objective of this program was to determine post-transport mortality rates. At Tatsamenie Lake a shipment of fry marked with an ancillary thermal mark was held and fed prior to release. The objective of this program was to increase the weight (perhaps triple it) of the fry to determine if larger size at release confers an advantage that will increase fry to smolt survival.

## Tallttan Lake

Four shipments totaling 1.9 million fry were made to Tahltan Lake June 7-13. The first two shipments of fry were held in net pens for $32-33$ hours prior to release. The estimated number of mortalities ( 2500 4000 ) represented $.23 \%$ to $.38 \%$ of the $1,036,000$ transported fry. The last two shipments of fry were not held in net pens due to extreme wind conditions which made it difficult to maneuver the plane on the lake; the number of fry released in these shipments totaled 836,900 fish.

## Tatsamenic Lake

Seven shipments totaling 3.6 million fry were made to Tatsanenie Lake June 15-27. The first shipment was released in the lake within 20 minutes. Five shipments totaling $2,694,400$ fry were held for periods ranging from 28-72 hours prior to release. The number of estimated holding mortalities was 51,000 to 57,000 (1.9 to $2.1 \%$ ) fish.

The remaining shipment of 394,300 fry was held and fed from June 25 to July 09 ( 15 days) prior to release. The estimated number of mortalities for this group was $20,000(5.1 \%)$ fish. The average weight of these fry increased from 0.11 g to 0.32 g during the course of the study. The surface water temperature ranged from 12 to $16^{\circ} \mathrm{C}$. Since these fish were marked with an ancillary thermal mark, it may be possible to determine if feeding and release at a larger size results in a survival rate that is higher than observed for the unfed release groups.

## Passive Flow Incubator - Tatsamenie Lake

An experimental passive flow incubator was setup in Tatsamenie Lake approximately 300 m from the lake outlet. Approximately 30,000 sockeye eggs were placed in the incubator on September 28, 1998. The estimated mortality rate on October 25 at the time of first picking (eyed stage) was $20 \%$. This high initial mortality may have been due in part to the inclusion of a female sockeye salmon of poor quality in the broodstock.

A summary of data for the 1998 average length and weight for the transboundary sockeye smolts is presented in the Table 9.

Table 9. Age composition and average length and weight by age for combined wild and planted transboundary sockeye smolts captured in 1998.

## Central Incubation Facility

As in past years, all eggs were incubated at the Snettisham Hatchery Central Incubation Facility. The otolith marks applied were of good quality based on the voucher samples analyzed by the ADF\&G otolith lab. Douglas Island Pink and Chum, Inc. (DIPAC), a private aquaculture organization in Juneau, runs the Snettisham facility. A cooperative agreement between ADF\&G and DIPAC provides for Snettisham to continue to serve the needs of the joint TBR planting projects.

## Otolith Analysis

## U.S. Otolith Lab

## Sampling and Processing Summary

During the 1998 season the ADF\&G otolith laboratory received approximately 13,514 otolith pairs from 110 separate commercial and test fisheries collections from U.S. District 106, 108, and 111 and Canadian Taku and Stikine River gillnet fisheries during an 11 week period. Of these, 5,274 otoliths were extracted from commercial fisheries openings in Districts 106 and 108 and 2,818 otoliths were taken from commercial fisheries District 111. Additional otoliths were collected from test fishing operations in District $108(1,668)$, Canadian test and commercial fisheries on the Stikine River $(1,328)$ and the Taku River (711) as well as Port Snettisham cost-recovery fisheries (808) and escapement samples (907). Of the otoliths collected, 11,973 were processed for thermal marks and 3,290 marked fish were identified and classified as belonging to one of 25 marking groups.

This year a change in ownership of a fish processing plant in Wrangle necessitated some adjustment in the sampling procedures for the Stikine River stocks. This resulted in less than the desired number of samples being collected in Wrangell, however, other ports were often able to make up the shortfalls. In another change, the majority of fish sampled on the grounds in District 111 were recovered in Excursion Inlet rather than Petersburg. The sampling goal, of achieving a $95 \%$ confidence interval that was within $\pm 7.5 \%$ of the estimate, was met for each fishery opening.

This year the ADF\&G lab, under arrangements with Canada, processed 60 otoliths per week collected over a 10 -week period from the Canadian Taku inriver fisheries. Up to 200 Stikine inriver commercial and test fisheries otoliths were also examined weekly. Information from these samples was processed quickly to help provide information to managers. Samples from cost recovery fisheries in Gilbert Bay and Speel Arm (District 111-33, 35) were also examined on a weekly basis to help managers achieve adequate escapement of wild sockeye salinon to local streams.

Staff were able to keep up with the volume of samples received inseason and provide to ADF\&G and Canadian managers with estimates on hatchery contributions in six separate fishery openings per week. These estimates provided information on run timing and abundance of planted fish. Managers used the information to make decisions about the duration and timing of future commercial openings.

Results from the 1998 otolith processing results are summarized in Table 10.
Table 10. Samples processed and marks recovered for the U.S. otolith lab in 1998.

## Canadian Otolith Labs

DFO began developing capabilities to examine for the presence of otolith thermal marks in 1994. A term technician was hired in September of 1994 to work at the Pacific Biological Station (PBS) in Nanaimo, B.C. Otolith processing labs in both Juneau and Olympia (Washington Department of Fisheries) were visited to observe techniques and develop standardized terminology. The PBS lab, which is now processing otoliths from a number or southern British Columbia hatcheries (mainly chinook salmon) has processed most 1997 transboundary juvenile, and adult samples. Since the Canadian lab has been unable to provide results in a timely manner, the 1998 Stikine and Taku River adult commercial samples were processed inseason by the ADF\&G lab located in Juneau.

The Whitehorse office of DFO has started a satellite thermal mark lab. A lab technician has been trained to process smolt samples and some outstanding 1997 Tahltan Lake smolt samples have been processed. Additional training for adult processing and some equipment purchases will be made in the near future to ensure that this lab is fully functional.

${ }^{a}$ ancludes thermally marked fish.

Appendix A.5. Weekly salmon catch in the Alaskan District 106 commercial drift gillnet fisheries, 1998. Catches do not include Blind Slough terminal area harvests. Effort may be less than the sum of effort from 106-41\&42 and 106-30 because some boats fished in more than one subdistrict. Data based on scale pattern analysis.

${ }^{3}$ Includes themally marked fish.

Appendix A.7. Weekly salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 1998. Catches do not include Ohmer Creek terminal area harvests. The permit days are adjusted for boats which did not fish the entire opening and are less than the sum of the permits times the days open.

| Fisll removed for otolith samples |  |  |  | 26 | 364 |  |  |  |  |
| Total Spawners |  |  |  | 749 | 8,420 |  |  |  |  |

a A total of 20 sockeye was added to the July 11 th count (professional judgement) as the weir was installed late, after the run had commenced due to forest fires in the vieinity.
b A total of 1,574 females and 1,525 males were taken for broodstock ( 93 rejects included in the broodstock total).
c 390 fish were sacrificed for otolith analysis.
d unweighted ratio of wild to hatchery Tahltan fish from the weir samples applied to number of spawners

a Includes thermally marked fish.

Appendix B.7. Salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 19601998. Catches do not include Olumer Creek terminal area harvests. Permit days are adjusted for boats which did not fish the entire opening and may total less than the sum of the permits times days open.

a Estimate includes approximately 30,000 mortalities from overcrowding on 5/22, 1987.
b Estimate of 595,147 on June 14 expanded by average $\%$ of outmigration by date ( $97.5 \%$ ) from historical data.
c Estimate of $1,439,673$ on June 13 expanded by average \% of outmigration by date ( $96.8 \%$ ) from historical data.
${ }^{d}$ Estimate of $1,516,150$ on June 14 expanded by average \% of outmigration by date ( $97.5 \%$ ) from historical data.

a Chum Salmon are not included because of the difficulty of making an accurate estimate, the majority of the summer chum catch was of hatchery origin.

Appendix C.2. Estimate of the proportion of natural and planted sockeye salmon stock groups harvested in the Alaskan District 111 commercial drift gillnet fishery by week, 1998. Stock compositions estimated with scale pattern analysis, planted fish estimated from analysis of thermal marks.

a Mark-recapture estimates.
b Weir connt plus spawning ground survey.
e Weir counts are incomplete.
d Counts may be low due to uncounted fish passage past weir.
e In 1995 the weir was moved upstream to Tatsanienie Lake, the count of 8,000 is an expansion (based on past experience) of the 5,780 fish counted there.
$f$ The estimated retum of 10,381 through the Tatsamenie Lake weir in 1996is thought to represent approximately $80 \%$ of the sockeye nin past the old weir location at L. Tatsamenie. This results in a potential run of 12,976 sockeye salmon.

B The estimated returu of 8,363 throngh the Tatsamenie Lake weir in 1997 is thought to represent approximately $80 \%$ of the sockeyc rin past the old weir location at L. Tatsamenie Lake resulting in a potential run of 10,454 sockeye.
h The estimated count of 5,997 fish throngh Tatsamenie Lake weir in 1998 does not inelude an estimated 1,499 fist spawning in the ontlet strean i.e. total estimate 7,496 .
i Mininum estimates of escapement.

Appendix D.11. Aerial survey index escapement counts of large (3-ocean and older) Taku River chinook salmon, 1975-1998.

| 87-97 | 5,556 | 88 | 690 | 70,431 | 76,764 |
| 1998 | 5,090 | 0 | 0 | 61,382 | 66,472 |

a Mark-recaplure estimate through $9 / 20$ was 43,570 . Run through $10 / 05$ estimated nsing inriver test fish CPUE.
b Mark-recaptnre estimate through 9/18.
c Mark-recapture estimate through $10 / 01$.
d A second method of estimating the above border run by expanding test fishery CPUE yielded an estimate of85,053 coho salmon.
e Mark-rccapture estimate of inriver run size through $9 / 05$ of 50,249 was expanded by dividing by proportion of District 1 II CPUE of wild coho (.559)
f Inriver estimate through week 37 expanded by dividing by proportion of District I1I CPUE of wild coho (.54409) throngh week 37.
g miver estimate throngh week 39 expanded by dividing by proportion of District 111 CPUE of wild coho ( 0.8884 ) through week 39.
${ }^{h}$ Inriver estimate through week 39 expanded by dividing by proportion of Distriet 111 CPUE of wild coho ( 0.8887 ) through week 39.
: Inतiver estimate throngh week 39 expanded by dividing by proportion of District 111 CPUE of wild eoho ( 0.889 ) through week 39.
$j$ Mark-recapture estimate throtgh statistical weck 40 (September 29 to Oetober 04). The coho caught in the test fishery were released.
$k$ exparsion based on proportion of troll harvest of Taku fish after week 36 .

Appendix D.13. Escapement counts of Taku River coho salmon, 1984-1998. Counts are for age-. 1 fish and do not include jacks. Because of variability between methods, visibility, observers, and timing, these counts are not an index of run strength.

a Counts include jack chinook salmon.
b Weir was removed prior to the end of the coho nun.
c The chinook and sockeye escapements into Klukshu Lake are calculated from the weir count minus fish harvested above the weir site minus brood stock taken. The remainder of the food fishery harvest occurred below the weir, at Village Creek, and Blanchard and Takhanne Rivers.
d includes sockeye counts up to and including August 15.
Appendix E.8. Alsek River sockeye counts from U.S. and Canadian aerial surveys and from the electronic counter at Village Creek, 1985-1998.

| 1998 |  |  |  | 110 |  |  | 826 |

[^8]b Includes several streams frou Lo-Fog to Goat Creek.
c Incomplete count due to machine malfunction.
d Estimated count based on absolute electronic records $(5,313)$ and the total number of notn-operational days.
e Estimated comet based on absolute elcetronic records $(3,981)$ and the total number of non-operational days.
f Counts were estimated during the non-operational days by averaging the counts recorded three days before and before and three days after the malfunction.
g Estimated count based on absolute electrouic rccords $(2,101)$ and the total number of non-operational days.
h Estimated count based on absolute electronic records ( $3,92 \mathrm{I}$ ) and the total number of non-operational days.
