PACIFIC SALMON COMMISSION JOINT TRANSBOUNDARY TECHNICAL COMMITTEE

ESTIMATES OF TRANSBOUNDARY RIVER SALMON PRODUCTION, HARVEST AND ESCAPEMENT AND A REVIEW OF JOINT ENHANCEMENT ACTIVITIES IN 2003

REPORT TCTR (05)-1

September 2005

## ACRONYMS

| ADF\&G | Alaska Department of Fish and Game |
| :--- | :--- |
| AF | Aboriginal Fishery |
| CAFN | Champagne Aishihik First Nation |
| CPUE | Catch per unit effort |
| CWT | Coded Wire Tag |
| DFO | Department of Fisheries and Oceans (Canada) |
| DIPAC | Douglas Island Pink and Chum (Private Hatchery) |
| ESSR | Excess Salmon to Spawning Requirement (surplus fishery license) |
| IHN | Infectious Hematopoietic Necrosis (a virus which infects sockeye salmon) |
| LCM | Latent Class Model |
| MEF | Mid-Eye-Fork (fish length measurement) |
| POH | Post-Obital-Hyperal (fish length measurement) |
| PSC | Pacific Salmon Commission |
| SMM | Stikine Management Model |
| SPA | Scale Pattern Analysis |
| TAC | Total Allowable Catch |
| TRTFN | Taku River Tlingit First Nation |
| TBR | Transboundary River |
| TTC | Transboundary Technical Committee |
| YSC | Yukon Salmon Committee |

## LIST OF APPENDICES

Appendix Page
Appendix A.1. Weekly salmon catch in the Alaskan District 106 commercial drift gillnet fisheries, 2003. Effort may be less than the sum of effort from 106-41\&42 and 106-30 because some boats fished in more than one sub-district. ..... 59
Appendix A.2. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 106 commercial drift gillnet fisheries, 2003. Data based on SPA. ..... 60
Appendix A.3. Weekly salmon catch and effort in the Alaskan Sub-district 106-41\&42 (Sumner Strait) commercial drift gillnet fishery, 2003. ..... 61
Appendix A.4. Weekly stock proportions and catches of sockeye salmon harvested in the Alaskan Sub-district 106-41\&42 (Sumner Strait) commercial drift gillnet fishery, 2003. Data based on scale pattern analysis. ..... 62
Appendix A.5. Weekly salmon catch and effort in the Alaskan Sub-district 106-30 (Clarence Strait) commercial drift gillnet fishery, 2003. ..... 63
Appendix A.6. Weekly stock proportions and catches of sockeye salmon harvested in the Alaskan Sub-district 106-30 (Clarence Strait) commercial drift gillnet fishery, 2003. Data based on scale pattern analysis ..... 64
Appendix A.7. Weekly salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 2003. The permit days are adjusted for boats which did not fish the entire opening and are less than the sum of the permits times the days open. ..... 65
Appendix A.8. Weekly stock proportions and stock-specific catch of sockeye salmon in the Alaskan District 108 commercial drift gillnet fishery, 2003. Data based on SPA. ..... 66
Appendix A.9. Weekly salmon catch and effort an sockeye stock composition in the Alaskan District 108 test fishery, 2003. ..... 67
Appendix A.10. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the lower Stikine River, 2003. ..... 68
Appendix A.11. Weekly sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery in the lower Stikine River, 2003. Sex specific age compositions were calculated and the stock composition of the females sampled for egg diameters was expanded to the catch by age. ..... 68
Appendix A.12. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the upper Stikine River, 2003. ..... 69
Appendix A.13. Weekly salmon and steelhead trout catch and effort in the Canadian Aboriginal fishery located at Telegraph Creek, on the Stikine River, 2003. ..... 69
Appendix A.14. Catch by stock and week for sockeye salmon harvested in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2003. . ..... 70
Appendix A.15. Weekly salmon and steelhead trout catch and effort in the Canadian test fishery in the Stikine River, 2003 ..... 71
Appendix A.16. Weekly catch, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye stocks in the Stikine test fishery, 2003. Sex specific age compositions were calculated and the smoothed stock compositions of the females sampled for egg diameters was expanded to the catch by age. ..... 73
Appendix A.17. Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 2003. ..... 75
Appendix A.18. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 2003. ..... 76
Appendix A.19. Daily counts of adult chinook salmon passing through Little Tahltan weir, 2003. ..... 77
Appendix B.1. Salmon catch and effort in the Alaskan District 106 commercial drift gillnet fisheries, 1960-2003. Effort may be less than the sum of effort from 106- 41/42 and 106-30 since some boats fished in more than one sub-district ..... 79
Appendix B.2. Stock proportions and catches of sockeye salmon in the Alaskan District 106 commercial drift gillnet fisheries, 1982-2003. Catches do not include Blind Slough terminal area harvest. Data based on SPA ..... 81
Appendix B3. Salmon catch and effort in the Alaskan Sub-district 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 1960-2003 ..... 82
Appendix B.4. Stock proportions and catches of sockeye salmon in the Alaskan Sub-district 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 1985-2003. Data based on SPA ..... 83
Appendix B.5. Salmon catch and effort in the Alaskan Sub-district 106-30 (Clarence Strait) commercial drift gillnet fishery, 1960-2003 ..... 84
Appendix B.6. Stock proportions and catches of sockeye salmon in the Alaskan Sub-district 106-30 (Clarence Strait) commercial drift gillnet fishery, 1985-2003. Data based on SPA ..... 85
Appendix B.7. Salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 1960-2003. Permit days are adjusted for boats which did not fish the entire opening and may total less than the sum of the permits times days open ..... 86
Appendix B.8. Stock proportions and catches of sockeye salmon in the Alaskan District 108 commercial drift gillnet fishery, 1985-2003. Data based on SPA ..... 88
Appendix B.9. Salmon catch in the Alaskan District 106 and 108 test fisheries, 1984-2003. Table only includes years when test fisheries were operated. ..... 89
Appendix B.10. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2003. Data based on SPA. Table only includes years when test fisheries were operated ..... 90
Appendix B.11. Stock specific catches of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2003. Data based on SPA. Table only includes years when test fisheries were operated ..... 91
Appendix B.12. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the lower Stikine River, 1979-2003 ..... 92
Appendix B.13. Sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery in the lower Stikine River, 1979-2003. Stock compositions based on: scale circuli counts 1970-1983; SPA in 1985; average of SPA and GPA 1986; SPA in 1987 and 1988; and egg diameter in 1989-2003 ..... 93
Appendix B.14. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the upper Stikine River, 1975-2003. ..... 94
Appendix B.15. Salmon and steelhead trout catch in the Canadian Aboriginal fishery located at Telegraph Creek, on the Stikine River, 1972-2003 ..... 95
Appendix B. 16. Stock specific sockeye catches in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 1972-2003. ..... 96
Appendix B.17. Salmon and steelhead trout catch in the combined Canadian net fisheries in the Stikine River, 1972-2003. ESSR catches not included ..... 97
Appendix B.18. Salmon catches in the Stikine River harvested under Canadian ESSR licenses, 1992-2003. ..... 98
Appendix B.19. Salmon and steelhead trout catches and effort in Canadian test fisheries in the Stikine River, 1985-2003. ..... 99
Appendix B.20. Sockeye salmon stock proportions and catch by stock in the test fishery in the lower Stikine River, 1985-2003. Stock composition based on: SPA 1985; average of SPA and GPA 1986-1988; egg diameter 1989-2003 ..... 101
Appendix B.21. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye stocks, 1979-2003. Stock compositions based on: scale circuli counts 1979-1983; SPA in 1985; average of SPA and GPA 1986- 1988; and egg diameter analysis in 1989-2003. 1994-2000 and 2003 data from commercial catch. Estimates for 2001-2002 are from the test fishery... 102
Appendix B.22. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-2003 ..... 103
Appendix B.23. Aerial survey counts of Mainstem sockeye stocks in the Stikine River drainage, 1984-2003. The index represents the combined counts from eight spawning areas ..... 104
Appendix B.24. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 1984-2003. ..... 105
Appendix B.25. Weir counts of chinook salmon at Little Tahltan River, 1985-2003. ..... 106
Appendix B.26. Index counts of Stikine chinook escapements, 1979-2003. Counts do not include jacks (fish < 660 mm mef length). ..... 107
Appendix B.27. Index counts of Stikine coho salmon escapements, 1984-2003. Missing data due to poor survey conditions ..... 108
Appendix B.28. Stikine River sockeye salmon run size, 1979-2003. Catches include test fishery catches ..... 109
Appendix C.1. Weekly salmon catch and effort in the Alaskan District 111 and Sub-district 111-32 (Taku Inlet), commercial drift gillnet fishery, 2003. ..... 111
Appendix C.2. Estimate of the proportion of natural and planted sockeye salmon stock groups harvested in the Alaskan District 111 commercial drift gillnet fishery by week, 2003. Does not include Port Snettisham harvests ..... 113
Appendix C.3. Weekly stock-specific catch of wild and planted Taku River and Port Snettisham sockeye salmon harvested in the Alaskan District 111 commercial drift gillnet fishery, 2003 ..... 114
Appendix C.4. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the Taku River, 2003 ..... 115
Appendix C.5. Weekly stock proportions of sockeye salmon harvested in the Canadian commercial fishery in the Taku River, 2003 ..... 115
Appendix C.6. Weekly stock-specific catch of sockeye salmon in the Canadian commercial fishery in the Taku River, 2003 ..... 116
Appendix C.7. Weekly salmon and steelhead trout catch and effort in the Canadian test fishery in the Taku River, 2003 ..... 116
Appendix C.8. Mark-recapture estimate of above border run of chinook, sockeye, and coho salmon in the Taku River, 2003 ..... 117
Appendix C.9. Daily counts of adult sockeye salmon passing through Tatsamenie weir, 2003. ..... 118
Appendix C.10. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2003 ..... 120
Appendix C.11. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2003 ..... 121
Appendix C.12. Daily counts of chinook salmon carcasses at the Nakina River weir, 2003.. ..... 123
Appendix D.1. Salmon catches and effort in the Alaskan District 111 and Sub-district 111- 32 (Taku Inlet) commercial drift gillnet fishery, 1960-2003. Days open are for the entire district and include openings to harvest spawner chinook salmon, 1960-1975 ..... 124
Appendix D.2. Stock proportions and catches of sockeye salmon in the Alaska District 111 commercial drift gillnet fishery, 1983-2003. Data based on analysis of scale patterns, otolith marks, and incidence of brain parasites. Does not include catches inside Port Snettisham. ..... 126
Appendix D.3. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet catch by week, 1983-2003. Data based on scale patterns and incidence of brain parasites and includes only wild fish. ..... 127
Appendix D.4. Salmon catch in the U.S. subsistence and personal use fisheries in the Taku River, 1967-2003. The subsistence fishery was open 1967 to 1976 and 1985 and the personal use fishery was open 1989-2003. The harvests are minimum estimates because not all permits are filled out and returned. ..... 128
Appendix D.5. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the Taku River, 1979-2003 ..... 129
Appendix D.6. Sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery on the Taku River, 1986-2003. Data based on scale pattern analysis. ..... 130
Appendix D.7. Salmon catches in the Canadian Aboriginal fishery on the Taku River, 1980- 2003. ..... 131
Appendix D.8. Salmon and steelhead trout catch in the Canadian test fishery in the Taku River, 1987-2003. ..... 132
Appendix D.9. Taku River sockeye salmon run size, 1984-2003. Run estimate does not include spawning escapements below the U.S./ Canada border. The early season sockeye expansion is based on the proportion of fish wheel sockeye catch that occurs before the fishery opens. ..... 133
Appendix D.10. Sockeye salmon escapement estimates of Taku River and Port Snettisham sockeye stocks, 1979-2003. Spawners equals escapement to the weir minus fish collected for brood stock ..... 134
Appendix D.11. Taku River chinook salmon run size, 1979-2003. Run estimate does not include spawning escapements below the U.S./ Canada border. ..... 135
Appendix D.12. Aerial survey index escapement counts of large (3-ocean and older) Taku River chinook salmon, 1975-2003 ..... 137

$$

Appendix F.8. Age specific length and weight for wild and planted outmigrant sockeye salmon smolts sampled at Tahltan Lake weir, 1984-2003 ..... 162
Appendix F.9. Age specific length and weight for wild and planted outmigrant sockeye salmon smolts sampled at Tuya Lake, 1993-2003. ..... 163
Appendix F.10. Age specific length and weight for wild and planted outmigrant sockeye salmon smolts sampled at Tatsamenie Lake, 1992-2003. ..... 164
Appendix F.11. Tatsamenie Lake fall fry abundance and mean smolt length and weight by age class ..... 165
Appendix F.12. Egg to smolt survival by brood year for Tahltan Lake sockeye. ..... 166
Appendix F.13. Egg to smolt survival for Tatsamenie Lake sockeye smolt outmigrations. The number of spawning females determined from total female escapement (\# females weighted by stat. week derived from weir sampling) less females spawned + female broodstock mortalities + 0.6 * female. ..... 167
Appendix F.14. Tahltan Lake mean annual zooplankton biomass and densities, 1988 through 2003. ..... 168
Appendix F.15. Tuya Lake mean annual zooplankton biomass and densities, 1987 through 2003. ..... 170
Appendix F.16. Tatsamenie Lake mean annual zooplankton biomass and densities, 1988 through 2003 ..... 172
Appendix F.17. Summary of transboundary fry transport and thermal mark by lake and broodyear. ..... 174
Appendix F.18. Summary of Transboundary lakes egg receipt and incubation at Snettisham Hatchery by lake and brood year. ..... 175
Appendix F.19. Transboundary Lakes sockeye brood stock disease histories for brood years 1988 to 2003. ..... 176
Appendix F.20. Adult returns and catches of enhanced and wild sockeye for the Stikine River ..... 177
Appendix F.21. Catches and production of enhanced Taku River sockeye salmon. ..... 178
Appendix F.22. Acoustic Estimates of Limnetic Fry Populations in Transboundary Lakes ..... 179

## EXECUTIVE SUMMARY

Estimates of catches and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek Rivers for 2003 are presented and compared with historical patterns. Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Results from transboundary river sockeye salmon Oncorhynchus nerka enhancement projects are also reviewed.

## STIKINE

The 2003 Stikine River sockeye salmon run is estimated at 241,000 fish, of which approximately 120,000 fish were harvested in various fisheries including test fisheries. An estimated 121,000 Stikine River fish escaped to spawn, including 7,000 fish that migrated to the Tuya River block and were not harvested. The run was above the 1993-2002 averages, while the harvest was average. The Tahltan Lake weir count of 54,000 sockeye salmon was above the upper bound of the goal range (18,000 to 30,000 fish), the highest since 1992, and twice the 1993-2002 average. The estimated U.S. commercial catch of Stikine River sockeye salmon in Districts 106 and 108 was 47,000 fish and the Canadian inriver commercial, aboriginal, and excess salmon to spawning requirement (ESSR) fishery catch was 65,000 sockeye salmon. The inriver test fishery harvested 3,000 sockeye salmon and there was no marine test fishery in 2003. The Stikine Management Model (SMM) predicted a run greater than the preseason forecast after week 27. Weekly inseason model forecasts ranged from 150,000 to 283,000 sockeye salmon; the final inseason model prediction was 272,000 fish (both U.S. and Canada), with a total allowable catch (TAC) of 209,000 fish. Based on the postseason run estimates and TAC calculations of 90,000 Stikine River fish for each country, Canada harvested $68 \%$ and the U.S. harvested $54 \%$ of their respective TACs. The broodstock collection and otolith sampling removed 4,000 and 400 sockeye salmon respectively from the escapement to Tahltan Lake leaving a spawning escapement of 50,000 fish. The estimate of 58,000 mainstem spawners is above the upper goal range of 40,000 spawners, is near the record of 72,000 spawners in 1993, and $73 \%$ above the 1993-2002 average. The total sockeye salmon escapement calculated from mark-recapture study was 143,000 sockeye salmon, $8 \%$ above of the estimate generated from the test fishery catch per unit effort (CPUE).
The harvest of Chinook salmon O.tshawytscha in Canadian commercial and aboriginal fisheries in the Stikine River was 1,400 large fish and 1,100 jacks, $60 \%$ and $203 \%$ of the 1993-2002 respective averages. An additional 1,300 large and 800 jack Chinook salmon were taken in the Canadian inriver test fishery. The U.S. marine harvest of Chinook salmon (all stocks) in the District 106 and 108 mixed stock gillnet fisheries was 700 fish, $35 \%$ of the 1993-2002 average harvest. The Chinook salmon spawning escapement of 6,500 large adults through the Little Tahltan River weir in 2003 was above the recently revised joint U.S./Canada escapement goal range of 2,700 to 5,300 fish, but was close to the 1993-2002 average. The total Stikine River Chinook salmon escapement as estimated from a mark-recapture study is 40,200 fish.
As with Chinook salmon, the U.S. marine harvest of Stikine River coho salmon O. kisutch is unknown since there is no stock identification program for this species. Mixed stock coho salmon harvest in Districts 106 and 108 were 212,000 and 39,000 fish, respectively, and were $8 \%$ and $212 \%$ above the 1993-2002 respective averages. Alaskan hatchery fish comprised approximately $40 \%$ ( 101,000 fish) of the coho salmon harvest from the two districts. The Canadian inriver coho salmon catch of 190 fish was $15 \%$ of the 1993-2002 average. Based on the test fishing performance the estimated total inriver coho salmon run was 55,000 fish, well
above the interim escapement goal range of 30,000 to 50,000 fish. Aerial surveys of coho salmon spawning index sites were not conducted in 2003 due to extremely high water and inclement flying conditions.

## TAKU RIVER

The estimated 2003 Taku River sockeye salmon run is 338,000 fish, including an estimated catch of 170,000 fish and an above-border spawning escapement of 168,000 sockeye salmon. The run size was $37 \%$ above the 1993-2002 average of 247,000 fish and the escapement was roughly 2.2 times the escapement goal range of 71,000 to 80,000 fish. An estimated 136,000 Taku River sockeye salmon were harvested in the District 111 commercial fishery, $36 \%$ above the 19932002 average, and an estimated 1,100 sockeye salmon were harvested in the U.S. inriver personal use fishery. Canadian inriver commercial and aboriginal fishery harvest included 33,000 and 300 sockeye salmon, respectively. The commercial harvest was $7 \%$ above the 19932002 average harvest of 31,000 fish. Using the center of the escapement goal range of 75,000 fish Canada harvested an estimated $13 \%$, and the U.S. took $52 \%$ of the TAC.

The harvest of large Chinook salmon in the Canadian commercial fishery in the Taku River was 2,000 fish, $9 \%$ above the 1993-2002 average; in addition, 600 jack Chinook salmon were caught compared to an average of 200 fish. The Canadian aboriginal fishery in the Taku River harvested 300 large Chinook salmon. District 111 mixed stock gillnet fishery harvest of 1,500 Chinook salmon was $47 \%$ of the 1993-2002 average. Approximately $22 \%$ of the harvest was estimated to be of Alaska hatchery origin. The above-border mark-recapture estimate for Chinook salmon is 40,000 fish, within the escapement goal range of 30,000 to 55,000 fish.

The estimated above border run of Taku River coho salmon in 2003 is 187,000 fish, which is 2.3 times the 1993-2002 average. The Canadian inriver commercial harvest included 3,200 coho salmon, $56 \%$ of the 1993-2002 average of 5,800 fish. After upriver Canadian harvest are subtracted from the inriver run, the above-border-spawning escapement is estimated at 183,000 coho salmon, which exceeds the minimum escapement goal of 38,000 fish. The U.S. harvest of 24,000 coho salmon in the District 111 mixed stock fishery was $48 \%$ of the 1993-2002 average. Alaskan hatcheries contributed an estimated 6\% of the District 111 harvest, or 1,500 fish.
The harvest of 112,000 pink salmon O. gorbuscha in District 111 was $12 \%$ above the 1993-2002 average catch. Pink salmon were not retained in the Canadian commercial inriver fishery in 2003. The escapement of pink salmon to the Taku River was likely above average as evidenced by the fish wheel catch and release of 15,500 pink salmon, $24 \%$ above the 1993-2002 average.
The catch of chum salmon $O$. keta in the District 111 fishery was 170,000 fish; composed of 169,000 summer run fish (prior to mid-August) and 1,000 fall run fish. The harvest of summer chum salmon, primarily Alaskan hatchery stocks, was $55 \%$ of the 1993-2002 average. The harvest of fall chum salmon, composed of wild Taku River and Port Snettisham stocks, was 20\% of the 1993-2002 average. As with pink salmon, there was non-retention of chum salmon in the Canadian inriver fishery and the reported catch was 0 fish in 2003. Although spawning escapement is not known the Canyon Island fish wheel catch of 270 chum salmon was $89 \%$ of the 1993-2002 average.

## ALSEK RIVER

The Alsek River sockeye salmon harvest of 40,000 fish in the U.S. commercial fishery was 2.2 times the 1993-2002 average harvest. The Canadian inriver harvest of 2,800 fish was twice the 1993-2002 average harvest. The Klukshu River weir count of 34,000 sockeye salmon was 2.6
times the 1993-2002 average and was above the goal-range of 7,500 to 15,000 fish. The count of 3,100 early run sockeye salmon (count through August 15) was close to the 1993-2002 average. The late run count of 31,000 fish was three times the average for the same period. The markrecapture program indicated an Alsek River sockeye salmon run above Dry Bay of 90,000 fish with the Klukshu stocks representing 38\% of the total Alsek River run.
The Chinook salmon run to the Alsek River seemed below average. The U.S. Dry Bay catch of 900 Chinook salmon was $55 \%$ above the 1993-2002 average of 600 fish. The combined Canadian sport and aboriginal fishery catch of 200 Chinook salmon was $41 \%$ of the 1993-2002 average. The 1,700 Chinook salmon counted through the Klukshu River weir was $61 \%$ of the 1993-2002 average. Of the total count, 1,660 Chinook salmon were estimated to have spawned, thus achieving the escapement goal range of 1,100 to 2,300 Chinook salmon. The mark-recapture estimate of the spawning escapement of large fish in the Alsek River is 4,300 fish compared to an average of 10,000 fish (1997-2002 years of operation of the project). An estimated $32 \%$ of these fish spawned in the Klukshu system.
Current stock assessment programs prevent an accurate comparison of the Alsek River coho salmon run with historical runs. The U.S. Dry Bay catch of 50 coho salmon was $<1 \%$ of the 1993-2002 average, while the combined Canadian inriver aboriginal and sport fishery catch of 200 fish was $40 \%$ above the average. The operation of the Klukshu weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is over; however, it does provide an annual index. The count of 3,700 coho salmon was $26 \%$ above the 1993-2002 average.

## ENHANCEMENT

Eggs and milt were collected from the year 2003 sockeye salmon escapements at Tahltan and Tatsamenie Lakes. For the seventh year in a row the 6.0 million egg-take goal was not achieved at Tahltan Lake, despite an above average escapement. A total of 5.4 million eggs was collected at Tahltan Lake. At Tatsamenie Lake, 2.5 million eggs were collected for the hatchery. Approximately 200,000 eggs were collected for an in-lake incubation project.
Outplants of 2002 brood-year sockeye salmon fry in May and June 2003 included, 2.6 million fry into Tahltan Lake, 1.1 million fry into Tuya Lake, and 1.4 million fry into Tatsamenie Lake. Green-egg to planted-fry survivals were $94 \%, 89 \%$, and $59 \%$ for the Tahltan, Tuya and Tatsamenie outplants, respectively. Survival to emergence was above average for Tahltan and Tuya lakes and below average for Tatsamenie Lake. Three brood year 2002 incubators from the Tatsamenie Lake were lost to IHNV and approximately 442,000 fry held in a net pen at the lake were also lost due to the IHN virus; these losses represent the largest IHNV loss since the Tatsamenie program began. Losses from IHN have occurred in the past at Snettisham Hatchery and are expected in sockeye salmon culture.
Outmigrant smolt sampling was conducted at Tahltan and Tatsamenie Lakes in 2003. Total emigration from Tahltan Lake was an estimated at 1,960,000 smolts with approximately $50 \%$ (981,000 outmigrants) from past fry plants. Sampling at Tuya Lake was not conducted in 2003. The Tatsamenie Lake smolt mark-recapture program estimated that 539,500 smolts (SE 22,507) emigrated from the lake. An estimated 457,600 of this total were age $1+$ wild smolts and 72,100 were age 1+ planted smolts. Estimates of survival of the brood year 2001 fry plants indicate that smolt from the fed outplanted fry had a 1.7 fold increase over the wild fry whereas, smolt from
the unfed outplanted fry had a 3.4 fold increase over the wild fry. The estimates of survival from fry to smolt were: early fed hatchery group, 1.9\%; early unfed hatchery group, $3.8 \%$; and $1.1 \%$ wild fish.

The egg incubation and thermal-marking program was continued at Snettisham Hatchery in 2003. Snettisham hatchery is operated by DIPAC (Douglas Island Pink and Chum, Inc.), a private aquaculture organization in Juneau. A co-operative agreement between ADF\&G and DIPAC provides for Snettisham hatchery to serve the needs of the joint TBR enhancement projects.
Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate the weekly contribution of fish from US/Canada TBR fry planting programs to the District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku Rivers. The estimated contributions of planted fish to Alaskan harvest were 16,600 planted Stikine River fish to District 106 and 108, ( $10.4 \%$ of that catch) and 800 planted Taku River fish to District 111 ( $<1 \%$ of that harvest). Estimates of contributions to Canadian fisheries included 25,000 planted fish to Stikine River fisheries ( $38 \%$ of that catch) and 300 planted fish to the Taku River fisheries ( $<1 \%$ of that catch).

## INTRODUCTION

This report documents estimates the 2003 catch and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek Rivers and discusses management actions taken during the season. Catch and effort data are presented by management week (U.S. statistical week) for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku Rivers are also summarized.

The Transboundary Technical Committee (TTC) met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial total allowable catch TAC estimates for the various species and rivers. The results of this meeting are summarized in: Pacific Salmon Commission Transboundary Technical Committee, 2003. Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers, 2002 (in prep).

Run reconstruction analyses are conducted on the sockeye salmon runs to the three rivers for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine catch are made for Alaskan fisheries outside of District 106 and 108 for Stikine River stocks, District 111 for Taku River stocks and Sub-district 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial gillnet fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet fisheries located in the lower and upper Stikine River, and by a Canadian aboriginal fishery in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A small sport fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a United States personal use fishery was established in the lower Stikine River; no catches were reported in this fishery in 1995 through 2000, approximately 30 sockeye salmon were harvested in 2001, and the personal use fishery on the Stikine River was not open in 2002 and 2003. Additional catches of unknown quantity are taken in U.S. troll and seine fisheries and in sport fisheries near Wrangell and Petersburg. In 1996, the spring experimental troll area in the District 110 portion of Frederick Sound was expanded to target hatchery Chinook salmon; four previous areas were combined into one large area that also included previously unopened waters. This area was the same in 2003. In 1993 the spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108. In 2002 this area was excluded and another small portion of District 108 was included in the experimental fishery. In 2003, the new area included in 2002 was excluded.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Negotiations between Canada and the United States to replace expired portions of Annex IV, Chapter 1 of the Pacific Salmon Treaty resulted in the following arrangements for Stikine River salmon which are expected to be in place for the 1999 to 2008 period:

## 1. General:

The Parties shall improve procedures for coordinated or cooperative management of the fisheries on transboundary river stocks. To this end, the Parties affirm their intent to develop and implement abundance-based management regimes for transboundary Chinook, sockeye and coho salmon no later than May 1, 2004.
2. Sockeye salmon:
(i) Assessment of the annual run of Stikine River sockeye salmon shall be made as follows:
a. a preseason forecast of the Stikine River sockeye salmon run will be made by the Committee prior to April 1 of each year. This forecast may be modified by the Committee prior to the opening of the fishing season;
b. inseason estimates of the Stikine River sockeye salmon run and the Total Allowable Catch (TAC) shall be made under the guidelines of an agreed Stikine Management Plan and using a forecast model developed by the Committee. Both U.S. and Canadian fishing patterns shall be based on current weekly estimates of the TAC. At the beginning of the season and up to an agreed date, the weekly estimates of the TAC shall be determined from the pre-season forecast of the run strength. After that date, the TAC shall be determined from the inseason forecast model;
c. modifications to the Stikine Management Plan and forecast model may be made prior to June 1 of each year by agreement of both Parties. Failure to reach agreement in modifications shall result in use of the model and parameters used in the previous year; and
d. estimates of the TAC may be adjusted inseason only by concurrence of both Parties' respective managers. Reasons for such adjustments must be provided to the Committee.
(ii) The Parties desire to maximize the harvest of planted Tahltan/Tuya sockeye salmon in their existing fisheries while considering the conservation needs of wild salmon runs. The Parties agree to manage the runs of Stikine River sockeye salmon to ensure that each country obtains $50 \%$ of the TAC in their existing fisheries. Canada will endeavor to harvest all fish surplus to escapement and broodstock needs returning to the Tuya and Tahltan Lake systems.
(iii) The Parties agree to continue the existing joint enhancement programs designed to produce annually 100,000 returning sockeye salmon.
(2) Coho salmon:
(i) Consistent with paragraph 1 above, the Parties agree to develop and implement an abundance-based approach to managing coho salmon on the Stikine River. Assessment programs need to be further developed before a MSY escapement goal can be established.
(ii) In the interim, the United States' management intent is to ensure that sufficient coho salmon enter the Canadian section of the Stikine River to meet the agreed spawning objective, plus an annual Canadian catch of 4,000 coho salmon in a directed coho salmon fishery.
(3) Chinook salmon:
(i) Both Parties shall take the appropriate management action to ensure that the necessary escapement goals for Chinook salmon bound for the Canadian portions of the Stikine River are achieved.
(ii) The Parties agree that new fisheries on Stikine River Chinook salmon will not be developed without the consent of both Parties. Consistent with paragraph 2, management of new directed fisheries will be abundance-based through an approach to be developed by the Committee. The Parties agree to implement assessment programs in support of the development of an abundance-based management regime.
(iii) The Parties shall review an appropriate MSY escapement goal for Stikine River Chinook salmon by May 1999 and establish a new goal as soon as practicable thereafter.

As in most previous years, the Transboundary Technical Committee (TTC) met prior to the season to update joint management and enhancement plans, develop run forecasts and determine new parameters for input into the inseason run forecast model, referred to as the Stikine Management Model (SMM). The model was upgraded to provide inseason forecasts of the total Stikine River sockeye salmon run as well as the following components of the run: the Tahltan stock (wild and planted combined); the planted Tuya stock; and the mainstem stocks. The model for 2003 was based on catch per unit effort (CPUE) data from 1985 to 2002 from District 106 and the Canadian commercial fishery in the lower river and from 1986 to 2002 from the lower Stikine River test fishery. Linear regression was used to predict run size from cumulative CPUE for each week of the fisheries beginning in week 25 for District 106 and week 26 for the inriver fisheries. As in 1999-2002, the intercept was forced to be zero in order to correct for a tendency to overestimate the run size in the early weeks during years of low abundance. Each CPUE and run size data set is significantly correlated.

In 2003 the inriver test fishery CPUE was the primary forecast used inseason because it has the most consistent historical database of the three data sets. Calculations were also made for the lower Stikine River commercial CPUE, which excluded catch and effort data from the Flood Glacier area, i.e., the new area introduced in 1997 and fished through the 2000 season. In addition, the annual weekly CPUE values for 1994 through 2000 were decreased by a factor of 0.75 for the extra gear allowed in the commercial fishery during that period. This made the historical CPUE data for that period more comparable with the 2003 fishing season and the pre1994 era.

In 2003, the preseason forecasts were used during statistical weeks 25 (June 15 - 21) through 27 (June 29 - July 05). After week 27, inseason forecasts of total run size and TAC, produced by the SMM and based on the test fishery catch-per-unit-effort (CPUE) data, were used to assist in determining weekly fishing plans (Table 1). The weekly inputs to the model included: the catch, effort and stock composition (proportion Tahltan/Tuya fish from egg diameters, proportion planted Tuya fish from thermal mark analyses of otoliths) in the Canadian lower river test and commercial fisheries; the upper river catch in the aboriginal fishery (AF) and upper river commercial fishery; the catch, effort and assumed stock composition in Sub-district 106-41 (Sumner Strait); and, the catch and assumed stock composition in District 108 and Sub-district 106-30 (Clarence Strait). Preliminary thermal mark analyses were available inseason for the marine and lower river fisheries to account for Tuya production in the model and reduce the risk of over-estimating the TAC of Tahltan sockeye salmon.

Table 1. Weekly forecasts of run size and total allowable catch for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model, 2003.

Postseason run estimate (Table 2) = 245,127

[^0]Initially, average stock proportions in District 106 and 108 catches, from historical postseason scale pattern analysis (SPA), were assumed for weekly catches; the averages used each week depended upon whether the run was judged to be below average, average, or above average. The Tuya and planted Tahltan stock proportions were subsequently adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108. Inseason otolith sampling was conducted to estimate the contribution of planted Tahltan and Tuya Lake sockeye salmon to catches in these areas. The weekly estimate of Tuya fish in District 106-41 and 108 was added to the historical proportion of Tahltan fish in the SMM since this stock was not present in the historical database.

The preseason forecast for the Stikine River sockeye salmon run was approximately 184,000 fish (Table 1), which indicated a run size close to the 1993-2002 average run of 183,835 fish (Appendix B.28). The forecast included approximately 54,700 natural Tahltan sockeye salmon (30\%), 40,900 planted Tahltan fish (22\%), 19,600 planted Tuya sockeye salmon (11\%), and 68,400 mainstem fish ( $37 \%$ ). Canadian inseason predictions of total run ranged from 183,600 to 283,822 sockeye salmon; U.S. forecasts ranged from 184,000 to 283,822 sockeye salmon (Table 1). All forecasts indicated an above average run. Because run size generated from the inriver test fishery data proved more accurate than that generated from the commercial fishery data, only the forecasts derived from inriver test fishery data were used in 2003. Unlike the 2000-2002 fishing seasons where the preseason forecast was more accurate than inseason forecasts, this year the inseason estimates were closer to the final postseason estimate. Differences in U.S. and Canadian weekly predictions are due only to different catch data inputs being used for the updates.

The postseason estimates of run size and TAC were close to the predictions that were used inseason for management. For example, the final inseason forecast generated by the SMM indicated a run of approximately 272,000 sockeye salmon and a TAC of 209,000 fish (Table 1), while the postseason estimate of 240,977 fish had a TAC of 173,761 sockeye salmon. Run size and TAC projections from the SMM in general increased after statistical week 28 through to stat week 31 when the run size and TAC peaked at 284,000 and 220,000 respectively. The run forecasts for the last three weeks (weeks 31 through to 33 ) were above the postseason run estimate and indicated that a surplus TAC was available to harvest.

## U.S. FISHERIES

The 2003 gillnet harvest in District 106 included 422 Chinook; 116,904 sockeye; 212,057 coho; 470,697 pink, and 300,253 chum salmon (Appendix A. 1 and B.1). The harvests of Chinook and sockeye salmon were below the 1993-2002 averages, while the coho, pink and chum salmon harvests were above average (Figure 2 Appendix B.1). The sockeye salmon harvest was $72 \%$ of the 1993-2002 average of 163,246 fish. The postseason estimate of the contribution of Stikine River sockeye salmon to the District 106 total sockeye salmon harvest was 18,920 fish or $16 \%$ of the harvest (Appendix A. 2 and B.2). First year runs of sockeye salmon to Neck Lake contributed an estimated $431(0.4 \%)$ to the District 106 fishery. The Chinook salmon harvest was $52 \%$ of the 1993-2002 average of 818 fish. An estimated 192 Chinook salmon in the District 106 harvest (45\%) were of Alaska hatchery origin (Appendix A.1). The coho salmon harvest was $8 \%$ above the 1993-2003 average of 195,834 fish and was the $7^{\text {th }}$ highest on record (Appendices A. 1 and

Figure 2. Average catches and fishing efforts compared with 2003 for the Alaska Districts 106 and 108 and for the Canadian inriver fisheries in the Stikine River.
B.1). An estimated 93,454 coho salmon were of Alaska hatchery origin, $44 \%$ of the total coho salmon harvest. The chum salmon harvest was $22 \%$ above the 1993-2002 average of 245,613 fish and Was the third highest on record. The pink salmon harvest was $12 \%$ above the 1993-2002 average of 420,147 fish.
The District 106 drift gillnet fishery was open for 59 days from June 15 through October 14 (Appendix A. 1 and B.1). This was $40 \%$ above the 1993-2002 average fishing time of 42 days. Sections 6-A, 6-B, and 6-C were open simultaneously each week throughout the season. Fishing effort in number of vessels fishing in District 106 was below average for the most of the season (Appendix B.1). The greatest effort in vessels fishing, 92 boats, and total effort, 368 boat days both occurred in week 35 (Appendix A.1). The total season effort was 3,837 boat days, $97 \%$ of the 1993-2002 average of 3,972 boat days (Appendix B.1).

The Sumner Strait fishery (Sub-districts 106-41 \& 42) harvested an estimated 18,112 Stikine River sockeye salmon (Appendix A. 4 and B.4), 20\% of the total sockeye salmon harvest in that sub-district. The Clarence Strait fishery (Sub-district 106-30) harvested and estimated 808 Stikine River sockeye salmon (Appendix A. 6 and B.6), $3 \%$ of the total sockeye salmon harvest in that sub-district.

In District 108, 312 Chinook, 42,158 sockeye, 38,795 coho, 76,113 pink, and 51,701 chum salmon were harvested for the season (Appendix A. 7 and B.7). The District 108 sockeye salmon harvest was $74 \%$ of the 1993-2002 average of 57,327 fish. The estimated 27,632 Stikine River sockeye salmon (Appendix A. 8 and B.8) comprised $65 \%$ of the District 108 sockeye salmon harvest (Figure 3). The Chinook harvest was 24\% of the 1993-2002 average of 1,282 fish and included an estimated 209 fish ( $67 \%$ of the harvest) Alaska hatchery Chinook salmon. The coho salmon catch was 2.1 times the average of 18,339 fish and included 7,260 Alaska hatchery salmon, $19 \%$ of the harvest. The chum harvest was $6 \%$ above the 1993-2002 average of 48,500 fish and the pink salmon harvest was 2.3 times the 1993-2002 average of 32,913 fish.
The District 108 fishery started on July 6 and ran through October 14. The 56 days the district was open is $22 \%$ above the 1993-2002 average of 46.0 days (Appendix A. 7 and B.7). District 108 was not opened until week 28 due to the potential for a weak Tahltan sockeye salmon run. Once it became apparent that the Stikine River was as strong as forecasted, extended fishing time occurred in District 108. As a result of the delayed opening of the fishery, comparisons of 2003 harvest to averages are of limited value. The fishing effort in number of vessels fishing in District 108 was below average most openings except during weeks 37 (early September) through 41 (early October). The season effort of 1,705 boat-days in District 108 was 20.7\% above the 1993-2002 average of 1,413 boat-days (Appendix B.7).
The District 108 test fishery did not take place in 2003 (Appendix A.9). Annual harvests and stock compositions from 1960 to 2000 for District 6 and 8 test fisheries are provided in Appendices B.9-B.11.

Harvests in Districts 106 and 108 consist of species of mixed stock origin; the contribution of Stikine River stocks is estimated only for sockeye salmon. The proportions of Stikine River sockeye salmon in the District 106 and 108 harvests were estimated inseason using both the

Figure 3. Sockeye salmon catches for the Alaska District 106 and 108 and the combined Canadian fisheries in the Stikine River and Stikine River sockeye salmon escapements, 1979-2003.
historical proportions of each stock and the inseason proportions of thermally marked fish from fry plants to Tahltan and Tuya Lakes.

The District 106 gillnet season began 12:00 noon on Sunday, June 15 (statistical week 25) for a 48 hour period. This opening is normally two days and any decision to extend fishing is based on fishery harvest rates estimated by management biologists on site in the fishery. District 108 was closed for this opening to limit harvest of the Tahltan sockeye salmon stock. Due to the high potential for a weak Tahltan run potentially resulting in an escapement below the desired goal of
24,000 fish to that system, no openings were expected in District 108 and no fishery extensions were expected in District 106 for the first 3-4 weeks of the fishing season. The estimated sockeye salmon CPUE in District 106 for statistical week 25 was below the 1993-2002 average for this week. However, the fishery was open in week 25 in only five years during the 1993-2002 period. There were 27 boats fishing in Sumner Strait (106-41) and 4 boats were fishing in Clarence Strait (106-30) during this opening (Appendices A. 3 and A.5). The inseason otolith readings for District 106 for week 25 indicated that the harvest in Sumner Strait had similar proportions of marked Tahltan bound fish (10.6\%) and of Tuya fish (9.6\%). The preseason SMM forecasted a total Stikine River TAC of 175,214 fish and a Tahltan TAC of 71,700 (Table 1). This would allow the U.S. fisheries to harvest a total of 87,607 Stikine River fish, including 35,850 Tahltan fish. The pre-season forecast was used for weeks $25-27$ and the inriver test fishery CPUE data was used for the remainder of the sockeye salmon season.
During statistical week 26 (June 22-June 28) there were 36 boats fishing in Sumner Strait and 9 boats fishing in Clarence Strait. The sockeye salmon CPUE in District 106 was above the 19932002 average for this week however there was no fishery extension in District 106 and District 108 remained closed.

During statistical week 27 (June 29-July 5), there were 56 boats fishing in Sumner Strait and 10 boats fishing in Clarence Strait. The District 106 sockeye salmon harvest and CPUE were below the respective 1993-2002 averages. District 108 remained closed and no extension was given in District 106 for this opening. This week the SMM switched from the preseason forecast to a forecast based on the Canadian inriver test fishery CPUE for the week 28 projections (Table 1). The inseason otolith readings for sub-district 106-41 for week 27 indicated that $19.4 \%$ and $18.9 \%$ of the catch was comprised of thermally marked Tuya and Tahltan fish, respectively. The estimated U.S. harvest by the end of this week was 5,937 Tahltan sockeye salmon, while the SMM projected a U.S. TAC of 23,350 Tahltan sockeye salmon.
During statistical week 28 (July 6-July 12) District 108 was opened for an initial two days based on very good Canadian test fish and lower river commercial CPUE as well as very good catches as the Rock Island tagging site. District 108 was open with restrictions in area outside of northern entrance to Wrangell Narrows and a line that prevented fishing in and near the river mouth (old Stikine closure line). There were 49 boats fishing in District 106 (13 in Clarence Strait and 36 in Sumner Strait) and 37 boats fishing in District 108. Surveys on the fishing grounds showed that the CPUE for the two-day opening in District 106 was above the 1993-2002 average and well above average in District 108. A one-day fishery extension occurred in both districts. On average, the peak Tahltan abundance occurs in District 106 in week 27; however, the 2003 statistical weeks were earlier than average, therefore week 28 was similar to the statistical week 29 historical averages when the majority of the Tahltan run has passed through
the District 106 fishery. The estimated U.S. harvest of Tahltan sockeye salmon in District 108 was 4,383 fish making a total U.S. harvest of Tahltan sockeye salmon of 14,687 fish through week 28 and the TAC from the SMM was 42,710 Tahltan sockeye salmon.
During statistical week 29 (July 13-July 19), 66 boats fished in District 106 and 65 fished in District 108. Indices of inriver run strength continued to be good with high catch rates in both the Canadian test fishery and the lower river commercial fishery. Both districts were open for an initial 3 days of fishing time. Fishing ground surveys showed that sockeye salmon CPUE for the three-day opening was average in District 106 and above average in District 108. A one-day midweek opening occurred in District 108. The inseason otolith readings for week 29 indicated that the marked Tahltan and Tuya fish contributed $11.5 \%$ of the District 106 catch and $34.8 \%$ of the District 108 catch. The SMM run prediction continued to increase. The estimated U.S. Tahltan harvest by the end of this week was 17,740 sockeye salmon and the TAC was 40,449 fish. An enlarged closure around Salmon Bay was implemented to increase sockeye salmon escapement into that lake system.
During statistical week 30 (July 20-July 26), there were 84 boats fishing in District 106 and 77 boats fishing in District 108. Both districts were open for an initial 3 days. The CPUE in District 106 was below the 1993-2002 average while in District 108 CPUE was above average. A twoday midweek opening occurred in District 108. The U.S. catch of Tahltan sockeye salmon was estimated at 22,366 fish with a TAC from the SMM of 44,412 fish. Based on historical migratory timing information and the relatively low abundance of thermally marked Tahltan and Tuya fish in the prior week it was assumed that these stocks were mostly through the fisheries. This was the final week of directed sockeye salmon fishing in Districts 106 and 108. The final model run in week 32 indicated a total U.S. harvest of Stikine sockeye salmon to be 54,505 with a total U.S. TAC of 106,647 (Table 1). The U.S. Tahltan harvest was estimated to be 22,799 fish with a U.S. TAC of 41,380 fish.

During statistical week 31 (July 27-August 2) through statistical week 35 (August 24-30), both Districts 106 and 108 were managed for pink salmon. Typically this switch from sockeye salmon to pink salmon management occurs during statistical week 33, however, this year's statistical weeks were shifted almost a week earlier than most years and a large early run of pink salmon was present. Both districts were open for four days per week during this time. Section D of District 106 was closed from week 32 through statistical week 37. Pink salmon harvests in both districts are not always a true reflection of abundance because low prices for pink salmon and catches of other more valuable species may affect the fishing patterns and methods. During the 2003 season, the fishing effort was substantially less than the 1993-2002 average in most weeks. High salmon catches in other districts, as well as high abundance of Dungeness crab, resulted in reduced effort in Districts 106 and 108. Despite the above mentioned, the total pink salmon harvest was well above the 1993-2002 average (Appendices B. 1 and B.7).
Coho salmon management typically commences in late August or early September in both the District 106 and 108 gillnet fisheries. During statistical week 36 (August 31 - September 6) the management emphasis changed from pink to coho salmon. Prior to the change to coho salmon management the District 106 fishery harvested 106,456 coho salmon, approximately $50 \%$ of the total District 106 coho salmon catch. The Alaska hatchery coho salmon contribution to the District 106 fishery was above average in most weeks. Weekly catches of wild coho salmon in District 108 were generally well above average. Both districts were open three or four days per week for weeks 36 through week 41 (August 31 - October 8) due to the projections of extremely
high coho salmon escapements throughout the region. The highest harvest of coho salmon occurred during week 38 (Appendix A.1). The season ended with a final two-day opening during week 42 (October 7-13).

## CANADIAN FISHERIES

Catches from the combined Canadian commercial and aboriginal gillnet fisheries in the Stikine River in 2003 included: 1,396 large Chinook, 1,057 jack Chinook, 58,784 sockeye, 190 coho, 850 pink, and 112 chum salmon (Figure 4, Appendices A.10, A. 12 and A.13). In addition to these catches, 7,031 sockeye salmon were taken in an ESSR harvest in the Tuya River (Table 2 and Appendix B.18). Catches of jack Chinook, sockeye, and pink salmon were above average. The catch of jack Chinook salmon was double the 1993-2002 average of 522 fish (Appendix B.17) while the catch of large fish was $60 \%$ of the average of 2,321 fish. The sockeye salmon catch (not including ESSR) was $34 \%$ above the 1993-2002 average of 43,782 fish, while the pink salmon catch was ten times the average of 81 fish. Of the total catch, including ESSR, an estimated 25,225 sockeye salmon originated from the Canada/U.S. fry-planting program, $38 \%$ of the catch (Table 2). The coho and chum salmon catches of 190 and 112 fish respectively were $15 \%$ and $73 \%$ of the 1993-2002 respective averages. (Appendix B.17).

Three test fisheries (Chinook, sockeye and coho salmon) were conducted for stock assessment purposes in the lower Stikine River in 2003. The test fisheries were located immediately upstream from the Canada/U.S. border. Combined test fishery catches included: 1,303 large Chinook, 770 jack Chinook, 3,356 sockeye, 1,699 coho, 297 pink, and 168 chum salmon (Appendix A.15). Test fishery catches of steelhead trout totaled 136 fish that were released. The objectives of the Chinook, sockeye, and coho salmon test fisheries were to obtain data for respective mark-recapture programs and to collect run timing information. Additional objectives of the sockeye salmon test fishery were similar to those in previous years: to provide inseason catch, stock ID and effort data for input into the SMM to forecast the inriver run size; and, to determine migratory timing and stock composition of the sockeye salmon run for use in the postseason estimations of the inriver sockeye and coho salmon run sizes.

## Lower Stikine River Commercial Fishery

Canadian commercial fishers in the lower Stikine River harvested 695 large Chinook, 672 jack Chinook, 51,735 sockeye, 190 coho, 850 pink, and 112 chum salmon in 2003 (Appendix A.10). The sockeye salmon catch was $41 \%$ above the 1993-2002 average of 36,644 fish (Appendix B.12). The catch of large Chinook salmon was $47 \%$ of the average 1993-2002 average of 1,487 fish, whereas the catch of jack Chinook salmon was 2.3 times the 1993-2002 average of 295 fish. Below average catches were recorded for coho ( $15 \%$ of the average of 1,273 ) and chum salmon ( $73 \%$ of the average of 153 fish). Pink salmon catches were ten times the 1993-2002 average of

${ }^{\mathrm{e}}$ Includes traditional, ESSR, and test fishery catches.
${ }^{\mathrm{f}}$ Does not include ESSR or test fishery catches.
${ }^{\mathrm{g}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than in the listed fisheries.

80 fish. All steelhead trout caught in the commercial fishery were released as required under regulations. The stock composition of the lower river sockeye salmon catch was as follows:

6,763 planted Tahltan fish, $13 \%$ of the catch; 15,304 wild Tahltan fish, $30 \%$ of the catch; 21,333 mainstem fish, $41 \%$ of the catch; and 8,335 planted Tuya fish, $16 \%$ of the catch (Table 2 , Appendix B.13).
Weekly guideline harvests, based on SMM forecasts of the total allowable catch (TAC) apportioned by average run timing and domestic and international allocation agreements, were developed each week to guide management decisions during the sockeye salmon season. Particular attention was directed at the inriver run and escapement forecasts of the various stock groupings. Management through statistical week 31 was focused primarily on the Tahltan Lake
sockeye salmon stock after which it switched to mainstem sockeye salmon stocks through the end of August. Coho salmon management focus commenced at the end of August.
The fishery commenced at noon on Sunday, June 22 (statistical week 26) for a scheduled opening of one day. Fishing time was kept to 24 hours due to only average CPUE (sockeye/fisher/day(s/f/d)) of Tahltan Lake sockeye salmon taken under ideal fishing conditions.

The fishery was posted for a two-day opening in week 27 (June 29-July 05). CPUE in day one of the fishery was well above average with Tahltan Lake stock accounting for the majority of the fish. This observation, in concert with exceptional test fish catches late in week 26, and a SMM week 27 weekly guideline catch of approximately 10,000 Tahltan Lake fish, prompted a two day extension. By days three and four of the opening the CPUE for the Tahltan Lake stock decreased slightly to approximately $102 \mathrm{~s} / \mathrm{f} / \mathrm{d}$, but remained above the 1993-02 average of $94 \mathrm{~s} / \mathrm{f} / \mathrm{d}$. Because of uncertainty of the early season performance of the SMM, and concerns that the model could potentially over-project run size as occurred in 2002, the fishery remained closed after a four day opening. The cumulative catch of Tahltan Lake sockeye salmon for week 27 was approximately 4,200 fish, well below the guideline catch of 10,000 pieces. CPUE of Tuya Lake sockeye salmon was above average, but it was not the predominant stock in the catch. The CPUE of mainstem sockeye salmon was more than double the 10 -year average.
In statistical week 28 (July 06-July 12), the fishery was posted for a two-day initial opening with expectation of an extension. Based on the exceptional test fish catches reported Friday through Sunday previous to the opening, it was immediately decided to extend one day. The CPUE of Tahltan Lake sockeye salmon in day one of the fishery was well above average ( $225 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ vs. 112 $\mathrm{s} / \mathrm{f} / \mathrm{d}$ ), which prompted another one-day extension. Although the fishery cumulative catch of 13,500 Tahltan Lake sockeye salmon taken through to the end of statistical week 28 (estimated day four catch) was approximately 2,500 below the guideline catch as generated by the SMM, it was decided to close the fishery after four days. The above average run of mainstem fish continued to hold over from week 27. The CPUE of Tuya Lake sockeye salmon was also above average.
The fishery was posted for three days for statistical week 29 (July 13-July 19) based on a SMM projection of Tahltan Lake sockeye salmon of 107,000 fish with a cumulative guideline harvest

Figure 4. Catches of Chinook, coho, pink, and chum salmon in the combined Canadian fisheries in the Stikine River, 1979-2003.
of 23,400 Tahltan Lake fish. The catch target for week 29 was, therefore, approximately 10,000 Tahltan Lake sockeye salmon. Catches in District 108, which opened in week 28, were well above average. The CPUE of Tahltan Lake sockeye salmon through to day two was above average ( $85 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ vs. $77 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), which prompted a one-day extension. Although the estimated fishery cumulative catch of 17,500 Tahltan Lake sockeye salmon taken through to the end stat week 29 (estimated day four catch) was approximately 5,000 fish below the guideline catch as generated by the SMM, it was decided to close the fishery after four days. This decision was made based on, once again, some uncertainty in the SMM performance, bolstered by the relatively low First Nations catch at Telegraph Creek ( $21 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ vs. $23 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ) and by the below average Tahltan Lake weir count (1,866 vs. 2,069 1993-2002 average). The CPUE of mainstem fish was twice the ten year average ( $82 \mathrm{~s} / \mathrm{f} / \mathrm{s}$ vs. $41 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ) in week 29. The CPUE of Tuya Lake sockeye salmon was also above average.
The fishery was posted for three days for statistical week 30 (July 20-July 26) based on a SMM projection of Tahltan lake sockeye salmon of 106,000 fish with a cumulative guideline harvest of 26,000 Tahltan Lake fish. The allowable catch for week 30 was, therefore, again approximately 10,000 Tahltan Lake sockeye salmon. Week 29 catches in District 108 were above average. The CPUE of Tahltan Lake sockeye salmon was near average ( $51 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ vs. $53 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), while the CPUE of mainstem sockeye salmon was over twice the 10 year average ( $150 \mathrm{~s} / \mathrm{f} / \mathrm{d} \mathrm{vs} .65 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ). Tuya sockeye salmon CPUE was also above average. On average close to $80 \%$ of the Tahltan Lake stock has transited the fishery by week 30 so, at this time, it was judged unlikely that our TAC would be met this year. The fishery was extended two days with a focus on harvesting the strong run of mainstem sockeye salmon. The cumulative catch of 20,200 Tahltan sockeye salmon was approximately 6,700 fish below the weekly guideline. The First Nations CPUE was above average this week, which indicated an above average run of Tahltan Lake bound sockeye salmon. The projected Tahltan Lake run based on the weir count to 26 July was 29,000 fish.

In week 31 (July 27 to Aug 02), the fishery was posted for three days and extended an additional two days based on the above average CPUE of mainstem fish ( $100 \mathrm{~s} / \mathrm{d} / \mathrm{f}$ vs. $60 \mathrm{~s} / \mathrm{d} / \mathrm{f}$ ). Management focus shifted from Tahltan Lake to mainstem sockeye salmon, which represented approximately $80 \%$ of the sockeye salmon catch this week. The SMM generated an inriver run size of approximately 105,000 mainstem sockeye salmon with a Canadian TAC of 52,600 fish. The catch of mainstem fish at the outset of the opening was only 13,000 fish leaving a huge surplus in TAC for week 31 and the balance of the fishing season. The CPUE for mainstem sockeye salmon remained above average throughout the fishery.
In week 32 (Aug 03 to Aug 09), the fishery was posted for three days and extended an additional two days based on the above average CPUE of mainstem fish ( $58 \mathrm{~s} / \mathrm{d} / \mathrm{f} v \mathrm{v} .55 \mathrm{~s} / \mathrm{d} / \mathrm{f}$ ) and on the fact that four licenses had pulled out of the fishery. The cumulative catch of approximately 21,000 mainstem fish by the end of this stat week was well behind the TAC of 52,600.
For the remainder of the fishery (weeks 33 to 37) weekly openings were liberal, ranging from three to seven days in an attempt to harvest the surplus TAC of mainstem sockeye salmon. The fishing effort, however, was light with some fishers electing not to fish during the majority of the available open days.
The sockeye salmon run timing appeared normal based on the sockeye salmon CPUE in the lower river commercial fishery. The 2003 Stikine River sockeye salmon run peaked in week 28 (06-12 July); the Tahltan and Tuya stocks peaked in week 28 (06-12 July); and, the mainstem
stock peaked in week 30(20-26 July) (Appendix A. 11 and A.16). The Tahltan and Tuya stocks have similar timing.

As in recent years, ESSR fishing activities again focused on the lower Tuya River to harvest surplus fish returning from the fry-planting program. A six-person crew gillnetted the mouth of the Tuya River from 15 July to 25 August and harvested at total of 7,031 sockeye salmon (Appendix B.18). This represents the highest catch and effort for this ESSR fishery since its inception in 1996. Fish were sold to a Prince Rupert fish buyer.

Out of 18 licenses available for the lower river commercial fishery, 11 licenses were issued in 2003 with a maximum of 11 licenses being active in any one week (Appendix A.10). The total effort was 267 permit-days, $72.9 \%$ of the 1993-2002 average of 366 permit-days (Appendix B.12). Gear was restricted to one drift or set gill net and the commercial fishing zone was reduced from the 1997-2000 zone defined by the Canada/US border upstream to the mouth of Flood Creek to an area bounded by the Canada/US border to the mouth of the Porcupine River (the pre-1997 fishing zone).

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. A total of 454 sockeye salmon was caught, which was $34 \%$ of the 1993-2002 average of 1,321 fish (Appendices A. 12 and B.14). A total of 19 large Chinook and 12 jack Chinook salmon were harvested which were $73 \%$ and $138 \%$ of the respective averages of 26 and 9 fish. The fishing effort was $28 \%$ of average with one fisher fishing one to five days per week. A total of 10 days was fished and the total effort was 10 permit-days. The 1993-02 average fishing time was 24 days with an average effort of 36 permit-days. Fishing time was the same as what was permitted in the lower Stikine River commercial fishery lagged by one week; except for the first opening in the upper river, which was concurrent with the lower river opening.

## Aboriginal Fishery

The Stikine River aboriginal fishery, which is located near Telegraph Creek, harvested 682 large Chinook, 373 jack Chinook, and 6,595 sockeye salmon (Appendix A. 13 and B.15). The catch of sockeye salmon was $13 \%$ above the 1993-2002 average of 5,818 fish. The harvest of large Chinook salmon was $84 \%$ of the average of 808 large fish, while the jack Chinook salmon catch was $71 \%$ above the 1993-2002 average of 218 jacks (Appendix B. 15).

## ESCAPEMENT

## Sockeye Salmon

A total of 53,933 sockeye salmon was counted through the Tahltan Lake weir in 2003; nearly double the 1993-2002 average of 26,906 fish. The 2003 count was the third highest on record (record count 67,326 in 1985) and was approximately $47 \%$ above the upper range of the escapement goal of 18,000 to 30,000 fish (Appendices A. 17 and B.22). In addition to the 400 fish sacrificed at the weir, a total of 3,946 sockeye salmon was collected for broodstock required for the fry-planting project, leaving a spawning escapement of 49,587 sockeye salmon (Table 2). Of the spawning escapement, an estimated 21,694 fish (44\%) originated from the fry-planting program, which is close to the $41 \%$ contribution of smolts observed in 2003, the principal cycle year contributing to the 2003 run (Appendix B. 24). The estimate of planted fish in 2003 was
based on the proportion of thermally marked otoliths from a sample of 400 sockeye salmon sacrificed at the weir for stock composition analysis.

The spawning escapements for the mainstem and the Tuya stock groups are estimated indirectly by computing the ratio of Tahltan to the mainstem and Tuya components in the total inriver sockeye salmon run. Stock identification data are collected in the lower river commercial and test fisheries. The ratios of Tahltan:mainstem and Tahltan:Tuya are applied to the estimated inriver Tahltan run size to develop an estimate of the total inriver sockeye salmon run. The escapements for Tuya and mainstem sockeye salmon stocks are estimated by subtracting the stock- specific inriver catches from the respective inriver run estimates.
The 2003 escapement estimates are 57,972 mainstem and 13,349 Tuya sockeye salmon. The mainstem sockeye salmon stocks spawn in tributaries, lakes other than Tahltan Lake, and in the mainstem and side sloughs of the Stikine River. The Mainstem spawning escapement estimate is approximately $69 \%$ above the escapement goal range of 20,000 to 40,000 fish. Aerial survey results, however, failed to show an above average escapement; in fact the count of only 604 fish was $59 \%$ of the 1993-2002 average of 1,029 sockeye salmon (Appendix B. 23). The Tuya River sockeye salmon are blocked, by natural barriers, from entering potential spawning grounds of the Tuya Lake and are, therefore, targeted in an ESSR (terminal) fishery. The 2003 Tuya ESSR (terminal) fishery harvested 7,031 sockeye salmon, representing a terminal harvest rate of 34\% (Appendix B.18). The fate of the remaining 13,349 Tuya fish is unknown. Radio telemetry data from 1998, 2000, and 2001 indicated fish moved from below the Tuya barrier to the mainstem Stikine River as far down river as the mouths of the Scud and Porcupine rivers. One fish was located in the Stikine River downstream from the Canada/U.S. boundary. Some Tuya sockeye salmon were found in the Tahltan River. In addition, otolith samples collected in August 20012003 from fish spawning in Shakes Creek (located approximately 50 km downstream from the Tuya River) indicated that all the sockeye salmon spawning in this area originated from Tuya fry plants.

For the fourth consecutive year a sockeye salmon mark-recapture program was conducted to develop an alternate abundance-based management regime for Stikine River sockeye salmon. The estimated total escapement using a modified Petersen estimate is approximately 143,100 sockeye salmon (marked=2,310, recovered=617, catch=54,884), ranging from 129,300 to 156,900 fish. This estimate is $8 \%$ above the 132,285 postseason escapement estimate, and $18 \%$ below the escapement estimate of 175,721 fish generated from the final run of the SMM. The stock-specific escapement estimates based on the mark-recapture study were 57,600 Tahltan ( $7 \%$ above the postseason commercial fishery cpue based estimate), 16,800 Tuya ( $82 \%$ of the cpue estimate), and 68,700 mainstem sockeye salmon ( $19 \%$ above the cpue).

## Chinook Salmon

The 2003 Chinook salmon escapement enumerated at the Little Tahltan weir was 6,492 large fish and 334 jack Chinook salmon (Figure 5, Appendices A. 19 and B.25). The escapement of large Chinook salmon in the Little Tahltan River was 22\% above the upper limit of the escapement goal range ( 2,700 to 5,300 fish with a point goal of 3,300 fish). Aerial surveys of the Tahltan River and Beatty Creek were discontinued in 2002. The peak survey count at Andrew Creek was 595 fish, $89 \%$ of the 1993-2002 average of 671 fish and below the escapement goal range of 650-1,500 fish (Appendix B. 26). The aerial survey count for the Little Tahltan River was 1,903 fish, $29 \%$ of the weir count and $81 \%$ of the 1993-2002 average.

For the eighth consecutive year a mark-recapture study was conducted to ass the inriver Chinook salmon abundance. The inriver run was estimated to be 43,022 Chinook salmon with a spawning escapement of 39,965 fish, $16 \%$ above the 1996-2002 average of 34,587 fish. The contribution of Little Tahltan Chinook salmon accounted for $16 \%$ of the total escapement, $84 \%$ of the 19962002 average contribution of $19 \%$.

## Coho Salmon

Aerial surveys were not conducted successfully in 2003. An attempt was made to enumerate Stikine coho salmon on October 26, but extremely high water prompted the decision to abort the survey after an overflight of the Scud index site. For the fourth consecutive year, a mark-recapture program was conducted to develop an abundance-based management regime for Stikine River coho salmon. As in year 2002, an additional set gillnet was deployed near the regular tagging site in an effort to increase the number of tagged salmon. The escapement estimated using a modified Peterson estimate ( $\mathrm{m}=1,187, \mathrm{r}=20, \mathrm{c}=1,889$ ) is approximately 105,000 coho salmon, with a range of 61,000 to 149,000 fish. Although the additional net used at the tagging site resulted an increase in marked fish over studies conducted in 2000-01, the paucity of recovered fish (marked and unmarked, $\mathrm{n}=1,889$ ) resulted in the very wide range in the coho salmon escapement estimate. Increased fishing effort (commercial and test fishing) is essential for future studies. This escapement estimate is two times the upper end of the escapement goal range of 30,000 to 50,000 coho salmon.

Figure 5. Chinook salmon weir counts and index escapement estimates for major spawning areas and for the entire Stikine River, 1979-2003.

The test fishery cumulative weekly CPUE of 6.85 coho salmon was the third highest on record. When compared with the cumulative weekly CPUE of 23.97 sockeye salmon, the coho salmon catch was $29 \%$ of the cumulative weekly sockeye salmon CPUE. The estimated inriver run size of sockeye salmon was 194,425 fish. Assuming the catchability of coho salmon is the similar to that of sockeye salmon (the same fishing site and gear were used), the coho salmon escapement is approximately $56,000\left(194,425^{*} 0.286\right.$-inriver catch). This estimate falls well below the markrecapture estimate although both estimates exceed the upper end of the escapement goal range.

## Sockeye Salmon Run Reconstruction

The 2003 Stikine River sockeye salmon run was estimated to be 240,977 fish, of which 98,106 were of Tahltan Lake origin (wild \& planted), 39,574 were of Tuya origin (fry from Tahltan broodstock planted into Tuya Lake), and 103,297 were mainstem stocks (Table 2). These estimates are based on scale pattern analysis and otolith recovery and analysis in the U.S. Districts 106 and 108 catches; otolith analysis, egg-diameter stock-composition estimates for inriver catches from the Canadian commercial, aboriginal, ESSR, and test fishery catches; and escapement data. The 2003 total run is 31\% above the 1993-2002 average run of 183,835 sockeye salmon (Appendix B. 28) and $31 \%$ above the preseason forecast of 183,600 sockeye salmon (Table 1).

## TAKU RIVER

Taku River salmon are harvested in the U.S. gillnet fishery in the Alaskan District 111, in northern Southeast Alaska seine and troll fisheries, and in the Juneau area sport fishery and inriver personal use fishery (Figure 6). Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an aboriginal fishery, and a sport fishery.

Figure 6. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Regulations

New fishing arrangements were in place in 1999 as a result of negotiations between Canada and the United States of Annex IV, Chapter 1 of the Pacific Salmon Treaty. The arrangements that are expected to apply to the Taku River for the 1999 to 2008 period are as follows:
(1) Sockeye salmon:
(i) Except as noted below, Canada shall harvest no more than $18 \%$ of the TAC of the wild sockeye salmon originating in the Canadian portion of the Taku River each year;
(ii) If the projected inriver escapement is greater than 100,000 sockeye salmon, Canada may, in addition, harvest $20 \%$ of the projected inriver escapement above 100,000 sockeye salmon;
(iii) The Parties agree to manage the runs of Taku River sockeye salmon to ensure that each country obtains catches in their existing fisheries equivalent to each country's share of wild sockeye salmon and a $50 \%$ share of fish originating from Taku River fry plants;
(iv) The Parties agree to continue the existing joint Taku River enhancement program designed to produce annually 100,000 returning sockeye salmon.
(2) Coho salmon:
(i) The Parties agree to develop and implement an abundance-based approach to managing coho salmon on the Taku River no later than May 1, 2004. The Parties commit to developing a revised MSY escapement goal to be implemented no later than May 1, 2004.
(ii) Until a new abundance-based approach is developed, the management intent of the United States is to ensure a minimum above-border inriver run of 38,000 coho salmon, and the following arrangements will apply:
a. no numerical limit on the Taku River coho salmon catch will apply in Canada during the directed sockeye salmon fishery (through statistical week 33);
b. if inseason projections of above-border run size are less than 50,000 coho salmon, a directed Canadian harvest of up to 3,000 coho salmon is allowed for assessment purposes as part of the joint Canada/US Taku River mark-recapture program;
c. if inseason projections of above-border run size exceed 50,000 coho salmon, a directed Canadian harvest of 5,000 coho salmon is allowed;
d. if inseason projections of above-border run size exceed 60,000 coho salmon, a directed Canadian harvest of 7,500 coho salmon is allowed;
e. if inseason projections of above border run size exceed 75,000 coho salmon, a directed Canadian harvest of 10,000 coho salmon is allowed.
(3) Chinook salmon:
(i) Both Parties shall take the appropriate management action to ensure that the necessary escapement goals for Chinook salmon bound for the Canadian portions of the Taku River are achieved.
(ii) The Parties agree that new fisheries on Taku River Chinook salmon will not be developed without the consent of both Parties. Management of new directed fisheries will be abundance-based through an approach to be developed by the Committee no later than May 01, 2004. The Parties agree to implement assessment programs in support of the development of an abundance-based management regime.
(iii) The Parties shall review an appropriate MSY escapement goal for Taku River Chinook salmon by May 1999 and thereafter establish a new goal as soon as practicable.

## U.S. FISHERIES

The traditional District 111 commercial drift gillnet salmon fishery was open for a total of 78 days from June 15, through October 16, 2003 (Appendix C.1). The harvest totaled 1,465 Chinook, 205,433 sockeye, 23,707 coho, 112,395 pink, and 170,420 chum salmon. Harvests of Chinook, coho, pink, and chum salmon were below average (Figure 7, Appendix D.1). The sockeye salmon harvest was above average. Weekly commercial fishery catches and stock composition estimates for these fisheries are provided in Appendices C. 1 - C. 3 and annual catches from 1960 through 2003 are provided in Appendices D. 1 - D.3.
Hatchery stocks contributed significantly to the numbers of both sockeye and chum salmon harvested, and minor numbers to the harvest of other species. The 2003 season was the fourth year of significant numbers of adult sockeye salmon returning to the Snettisham Hatchery inside Port Snettisham. These fish contributed significantly to the harvests primarily in Stephens Passage and to the Speel Arm Terminal Harvest Area fishery inside Port Snettisham.
The Chinook salmon harvest of 1,465 fish was $50 \%$ of the 1993-2002 average of 2,923 fish (Appendix C. 1 and D.1). Alaskan hatchery fish contributed 319 fish as estimated by coded wire tag (CWT) analysis, for approximately $22 \%$ of the harvest.
The sockeye salmon harvest was 205,433 fish, $41 \%$ above the 1993-2002 average of 146,087 fish (Appendices C. 1 and D.1). Weekly sockeye salmon harvests in District 111 were below average in statistical week (SW) 25, SW26, SW29, SW36, and SW38-41. Weekly sockeye salmon harvests were above average during SW27, SW28 and SW30-35, and SW37. Weekly sockeye salmon catch-per-unit-effort (CPUE) was a ten-year record for SW27, SW28, and SW32. However, weekly sockeye salmon CPUE was lower than average during eight out of

Figure 7. Average catches and fishing efforts computed with 2003 values for the Alaska District 111 commercial fishery and the Canadian commercial fishery in the Taku River.
eighteen statistical weeks. Domestic hatchery sockeye salmon stocks started to contribute to the traditional fishery in SW28 and added significant numbers to the harvests in SW29 through SW31. Fishermen targeting on those runs of hatchery sockeye salmon and the Limestone Inlet hatchery chum salmon, increased the amount and percentage of fishing effort that occurred in Stephens Passage. Of the total sockeye salmon harvest, 37\% occurred in Stephens Passage, greater than the 1993-2002 average of 23\%. Sockeye salmon from a joint U.S./Canada fryplanting program at Tatsamenie Lake contributed an estimated 767 fish to the fishery ( $0.4 \%$ of harvest (Appendices C. 3 and D.2)). Contributions of U.S. hatchery sockeye salmon to the Traditional District 111 gillnet fishery totaled 32,196 fish or $18 \%$ of the harvest. These were predominately Snettisham Hatchery fish but also included a small number of thermally marked fish from a fry-planting program at Sweetheart Lake in Port Snettisham. The postseason estimate of stock composition of the harvest of wild sockeye salmon in the district was 134,957 (92\%) Taku River fish and 9,983 (8\%) wild Snettisham fish (Table 3, Figure 8, Appendices C. 2 and C.3). An additional 27,530 sockeye salmon were harvested in hatchery terminal area fisheries inside Port Snettisham. The majority of these fish are from hatchery releases but a small portion of wild Speel Lake sockeye salmon stocks are also taken in this fishery.

Coho salmon stocks harvested in District 111 include runs to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams as well as Alaskan hatcheries. The coho salmon harvest of 23,707 fish was $48 \%$ of the 1993-2002 average of 49,070 fish (Appendices C. 1 and D.1). Weekly coho salmon harvests were above average during SW27, but below average during the remainder of the season. Coho salmon catch-per-unit effort was above average during SW37. Alaskan hatchery coho salmon contributed 1,505 fish or $6 \%$ of the District 111 harvest. For most of the season, weekly estimates of Taku River coho salmon abundance indicated an above average run size.
The District 111 pink salmon harvest of 112,395 fish was $12 \%$ above the 1993-2002 average of 100,667 fish (Appendices C. 1 and D.1).

The harvest total of 170,420 chum salmon was $55 \%$ of the 1993-2002 average of 312,823 fish (Appendices C. 1 and D.1). The summer chum salmon harvest, 169,214 fish, comprised $99 \%$ of the season's chum salmon harvest. The summer chum salmon run was considered to last through mid-August (SW33) and was comprised mostly of domestic hatchery fish, with small numbers of wild fish contributing to the catches. Chum salmon runs to DIPAC hatcheries in Gastineau Channel and to the DIPAC remote release site at Limestone Inlet contributed a major portion of the harvest but quantitative contribution estimates were not available. As in recent years, a gear restriction of a minimum six-inch mesh size net was employed during the last half July in the fishery openings in Section 11-B south of Circle Point. This allowed harvest of hatchery chum salmon returning to the Limestone Inlet remote release site while limiting harvest rates on wild sockeye salmon stocks. Approximately $63 \%$ of the District 111 chum salmon harvest was made in Taku Inlet, 32\% in Stephens Passage, and 2\% inside Port Snettisham. The harvest of 1,206 fall chum salmon, SW34 and later, was $19 \%$ of the 1993-2002 average (Appendix D.1). Most of these chum salmon are assumed to be wild fish of Taku and Whiting Rivers origin.

Table 3. Taku River sockeye salmon terminal run reconstruction, 2003. Estimates do not include spawning escapements below the U.S./Canada border.

${ }^{a}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than the listed fisheries.

Figure 8. Sockeye salmon catches for the Alaska District 111, the Icy and Chatham Straits, the combined Canadian commercial and food fisheries in the Taku River, and Taku sockeye salmon escapements, 1979-2003.

For the 2003 season fishing time was $55 \%$ above the 1993-2002 average time (Appendix D.1). The maximum number of boats participating in the fishery in a given week was 125 boats (Appendix C.1). Fishing effort as measured by the total number of boats delivering fish each week times the number of days open to fishing, was 3,977 boat-days for the season, $11 \%$ above the 1993-2002 average (Appendix D.1).
Management actions to conduct the Taku River drift gillnet fishery were limited to imposing restrictions in time, area and gear. Because there is no bi-laterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fishwheel catches. As the fishing season progresses sufficient data is acquired to estimate the inriver run size from the mark-recapture program at Canyon Island and to use that estimate in conjunction with migratory timing and historical fishery catch data to forecast the entire Taku sockeye salmon run. In the first week of the season (SW25), which began June 15, three days of fishing time were allowed in both Taku Inlet (Sub-district 111-32) and Stephens Passage (Sub-district 111-31). The sockeye salmon harvest in the first week was $72 \%$ of the tenyear average. Fishing time for SW26 was initially set for three days. The projected inriver run was estimated to be 284,476 sockeye salmon (Table 4). Both Taku Inlet and Stephens Passage were initially opened for three days in SW27, and then extended for 1 day based on strong inriver run projections and the increasing catch rate during the week. The Taku inriver run was estimated to be 39,582 fish. The projected inriver run was 191,464 with a total Taku sockeye salmon run of 311,926 fish (Table 4). The District 111 sockeye salmon catch for the week was 84\% above the 1993-2002 average. Approximately $98 \%$ of the sockeye salmon harvested during the week came from Taku Inlet, while the remainder was harvested in Stephens Passage. Both Taku Inlet and Stephens Passage were open initially for four days during SW28 due to strong inriver abundance estimates and high fishwheel catches. The catch of 42,050 sockeye salmon set a new record for SW28 and was more than double the ten-year average with $95 \%$ of the catch occurring in Taku Inlet. No extensions were given.

Table 4. U.S. inseason forecasts of terminal run ${ }^{\text {a }}$ size, TAC, inriver run size, and the U.S. harvest of Taku River sockeye salmon for 2003.

| Statistical Week | Inriver Run | Terminal Run | Total TAC | U.S. TAC | Projected U.S. Catch |

${ }^{\mathrm{a}}$ Terminal run does not include any marine harvest of Taku River salmon that might occur outside of District 111.
During SW29, both Taku Inlet and Stephens Passage were opened for four days. The 6" gillnet mesh restriction was established south of Circle Point to conserve Speel and Crescent wild stock sockeye salmon. The week's sockeye salmon catch was $74 \%$ of the 1993-2002 average with $82 \%$
of the harvest taken in Taku Inlet. Analysis of otoliths revealed that $14.1 \%$ (27 of 191) of the samples processed from Stephens Passage during this week were Snettisham hatchery sockeye salmon.

During SW30, 11B was initially opened for three days. Due to strong catches in the first days of the fishery, good Canyon Island (CI) fish wheel catches, and historical scale analysis from SW29 indicating very few Tatsamenie fish in the catch, Taku Inlet was extended for 1 day north of the revised Pete’s Rock to Pt Bishop line. The District 111 drift gillnet sockeye salmon catch of 24,003 was slightly above the 1993-2002 average for the week, with $87 \%$ of the catch in Taku Inlet. The District 111 coho salmon catch was 598 fish for the week (Appendix C.1), $46 \%$ the 1993-2002 average of 1,297 fish.

In SW31, Taku Inlet north of Circle Point was open for two days in accordance with the TBR agreement to conserve the anticipated weak run of Tatsamenie Lake sockeye salmon, and for three days south of Circle Point. Confidence in achieving the reduced lower end of the escapement goal range for Speel Lake allowed lifting the mesh restriction, and 11C was opened because pink salmon escapement in the area was adequate. Due to a surge in escapement at Speel, indications from Snettisham hatchery the sockeye salmon were returning a week earlier than usual, and historical stock composition data indicating very few Tatsamenie sockeye salmon caught in Stephens Passage, there was a 2-day extension south of Circle Point. Historically, by the end of SW31, 89\% of the Little Trapper Lake and 30\% of the Tatsamenie Lake sockeye salmon have passed Canyon Island. The weekly District 111 drift gillnet sockeye salmon catch total was $22 \%$ above the average with about $55 \%(17,025)$ being harvested from Stephens Passage where the fleet was targeting hatchery sockeye salmon bound for Port Snettisham.
The SW32 catch of 36,844 sockeye salmon was the highest catch for the stat week since 1960. Fishing time in Taku Inlet was held to two days to conserve Tatsamenie sockeye salmon while Stephens Passage south of Circle Point including Port Snettisham was open for 4 days. Of the 5,642 sockeye salmon harvested in Taku Inlet, $13.6 \%$ were Port Snettisham hatchery fish, for the 15,417 fish harvested in Stephen's Passage $66.7 \%$ were of hatchery origin, and an estimate $99.3 \%$ of the 15,803 fish harvested inside Port Snettisham were of hatchery origin. Due to a surge in escapement to Speel Lake, the Speel Arm Terminal Harvest Area was opened until further notice to harvest the Snettisham hatchery sockeye salmon run.

In SW33 the Taku Inlet opening was again limited to two days while Stephens Passage and outer Port Snettisham was opened for four days. The sockeye salmon catch for SW33 was 11,965 fish, 190\% of the 1993-2002 average. Estimated hatchery contributions were 19.0\% in Taku Inlet, $64.3 \%$ in Stephen's Passage, and $>99.0 \%$ inside Port Snettisham.
The fall drift gillnet season in District 111 lasted nine weeks, beginning on August 17 in SW34, and lasting until October 16 in SW42. Taku Inlet openings were limited to two days per week in SW 35, \& 36 to conserve Taku River fall chum salmon. In the first week of the fall season (SW34), fishing time was set at three days in Stephens Passage (south of Circle Point) and 11-C to allow continued harvest of hatchery sockeye salmon bound for Port Snettisham. The sockeye salmon catch for the week of 3,147 fish (Appendix C.1) was $29 \%$ above the 1993-2002 average with $89 \%$ taken in Stephens Passage and Port Snettisham. The coho salmon catch of 1,009 for week 34 was well below the ten-year average of 4,743 fish and remained well below average until week 37. During SW37, both Taku Inlet and Stephens Passage were opened for four days. Catch rates were slightly above the ten-year average for the only week of the season. The

Canyon Island fish wheel counts of coho salmon and inriver abundance estimates strengthened in week 37 and the inriver abundance estimate in week 38 was the second highest since 1984 prompting a one-day extension. Due to continued high inriver abundance estimates, low effort, and strong troller CPUE in the outer districts, Taku Inlet and Stephens Passage was open 7 days a week in weeks 39 through 41, and closed for the season after 4 days open in week 42 . There were no reported landings in week 42 . Even though the fishery performance of 23,707 fish was poor, the estimated above border Taku coho salmon escapement was the second highest on record (Appendix C.8).
Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2003. Personal use permits were used to harvest an estimated 1,126 Taku River sockeye salmon (Appendix D.4). In 2003, sport fisheries in the Juneau area harvested an estimated 12,697 Chinook salmon. A number of stocks are known to contribute to the Juneau area sport fishery, including those from the Taku, Chilkat, and King Salmon rivers, and local hatchery stocks, but the major contributor of large, wild mature fish was believed to be the Taku River. Of 12,697 Chinook harvested, 1,337 (11\%) were estimated to be of Taku River origin based on coded wire tag analysis and maturity data. The July Hawk Inlet shoreline purse seine fishery in Chatham Straits opened for 10 hours in week 28 from Pt Marsden north to the latitude of Pt. Couverden, and for 10 hours in week 29 from Pt. Hepburn north to the latitude of Pt Couverden. The catches for these fisheries totaled 52 Chinook, 8,342 sockeye, 413 coho, 178,219 pink, and 38,693 chum salmon. A large number of stocks, including the Taku River, contribute to this pink salmon directed fishery. A purse seine test fishery was also conducted each week, during the first two weeks in July, with catches totaling 7 Chinook, 574 sockeye, 24 coho, 3,619 pink and 4,042 chum salmon.

## CANADIAN FISHERIES

Taku River commercial fishers harvested 32,933 sockeye, 1,959 large Chinook, 570 jack Chinook (fish less than 2.3 kg ), and 3,242 coho salmon, and 27 steelhead trout in 2003 (Figure 7, Appendices C. 4 and D.5). The sockeye salmon catch was $7 \%$ above the 1993-2002 average of 30,673 fish (Figure 8). Fish originating from fry plants contributed an estimated 267 fish to the catch, comprising $0.9 \%$ of the total sockeye salmon harvest. The catch of coho salmon was $55 \%$ of the 1993-2002 average of 5,837 fish. The catch of large Chinook salmon was $6 \%$ above the average of 1,793 fish, while the catch of jack Chinook salmon was $286 \%$ of the average of 191 fish (Appendix D.5). There were 44 days of fishing, compared to the 1993-2002 average of 46 days. The seasonal fishing effort of 275 boat-days was $74 \%$ of the average of 371 boat-days. As in recent years, both set and drift gill netting techniques were used with the majority of the catch taken in drift gillnets. Mesh sizes were restricted to less than 150 mm through July 16 to minimize the incidental catch of Chinook salmon.
In addition to the commercial catches, 279 large and 237 jack Chinook, 267 sockeye, 416 coho, and four pink salmon were harvested in the aboriginal fishery in 2003 (Appendix D.7). The 1993-2002 average catches in the Taku aboriginal fishery have included 70 Chinook (large and jacks combined), 229 sockeye, 240 coho, and 3 chum salmon and two steelhead trout.

According to the estimate of 330,240 sockeye salmon, Canadian catches (excluding test fishery catches) represented approximately $13 \%$ of the TAC for wild fish. The run of planted fish to Tatsamenie Lake was estimated to be 2,467 fish, 269 of which were harvested in Canadian
commercial or aboriginal fisheries. This represented approximately $11 \%$ of the TAC of planted fish.

The inriver coho salmon run was 186,755 fish. Accordingly, as per PST provisions, the Canadian allowable catch after week 33 was 10,000 coho salmon. Only about $14 \%$ of this allocation was taken because commercial fishing activity deceased significantly after week 33 due to poor market conditions. An estimated 300 coho salmon were harvested in the recreational fishery.

A test fishery was conducted from April 27 through June 11 as part of the Chinook salmon mark-recapture project. This fishery landed 1,401 large Chinook, 398 jack Chinook, and 27 sockeye salmon (Appendices C. 7 and D.8).
As part of the coho salmon mark-recapture project, a catch-and-release gillnet fishery was conducted for coho salmon from August 23 through October 10 (Appendix C.7). Totals of 4,090 coho, 197 sockeye, 222 chum, and 7 pink salmon and 182 steelhead trout caught. All but 59 coho salmon and 7 steelhead trout were released.

The Canadian preseason forecast was for a total run of approximately 304,000 sockeye salmon, which was the average of a sibling-based forecast (350,900 fish) and stock recruitment-based forecast (256,700 fish) (Table 5). The point estimate was $17 \%$ above the previous 1993-2002 average run of approximately 259,000 sockeye salmon (Canadian estimate). The total run incorporates an assumed U.S. harvest of $5 \%$ in marine approach waters (outside District 111); the terminal run forecast was therefore approximately 289,000 fish. The preseason forecast was used to guide weekly management actions for the first two weeks of the season; thereafter, inseason forecasts based on the joint Canada/U.S mark-recapture project were used (Table 5). For coho salmon, the preseason outlook was for an average run due to good smolt numbers encountered in the 2002 coded-wire tagging program. However U.S. exploitation rates were expected to be low, and consequently border escapement was expected to be above average.
As in previous years, cumulative guideline harvests were developed each week to guide weekly management decisions so that: a) the catch was consistent with conservation and Treaty goals; and b) management was responsive to changes in forecasts of abundance, i.e. abundance based. The guidelines were based on current inseason forecasts of the total run and Canadian sockeye salmon TAC (based on mark-recapture estimates) apportioned by historical run timing.
The commercial fishery commenced at noon on Sunday, June 15 (SW25) for a scheduled opening of two days. Since the incidental catch of Chinook salmon was significant and both the current and cumulative sockeye salmon CPUE in the fishwheels were below average, the fishing period was not extended.

Table 5. Canadian inseason forecasts of total run size, total allowable catch (TAC), and spawning escapement of Taku River sockeye salmon, 2003.

| Statistical <br> Week | Total Run $^{\text {a }}$ | TAC | Projected <br> Escapement | Canadian <br> TAC | Inseason <br> Guideline | Actual <br> Catch |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 25 | 304,000 | 229,000 | 75,000 | 36,220 | 3,149 | 1,339 |
| 26 | 238,318 | 163,318 | 171,974 | 43,792 | 7,690 | 4,530 |
| 27 | 191,875 | 116,875 | 110,209 | 23,079 | 6,589 | 9,280 |
| 28 | 249,790 | 174,790 | 118,948 | 35,252 | 13,613 | 12,673 |
| 29 | 383,994 | 308,994 | 183,825 | 72,384 | 36,240 | 18,611 |
| 30 | 374,762 | 299,762 | 168,746 | 67,706 | 41,686 | 25,272 |
| 31 | 365,572 | 290,572 | 160,090 | 64,321 | 47,184 | 28,918 |
| 32 | 358,317 | 283,316 | 156,088 | 62,215 | 52,495 | 31,235 |
| 33 | 366,293 | 291,292 | 160,879 | 64,608 | 58,818 | 32,345 |
| 34 | 360,804 | 285,802 | 157,924 | 63,029 | 60,109 | 32,601 |

${ }^{\text {a }}$ Includes allowance for marine catches outside District 111 (assumed 5\% harvest rate)
In SW26 (starting June 22), the fishery was opened on three days. An extension of one day was granted for the following reasons: as of the close of Day 2 , the CPUE ( $128 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ) was well above average ( $73 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), and the third highest on record (dating to 1988); the lower end of the preseason forecast range provided a guideline harvest of 5,743 fish for the week with 1,213 more fish to be harvested. The final catch for the opening was 3,232 (Appendix C.4).
In SW27 (starting June 29) the fishery initially opened for three days. In spite of the fact that the run size estimate indicated a guideline harvest, which was likely to be exceeded (assuming average timing), the fishery was extended by one day due to high CPUE both in the fishery and the Canyon Island fishwheels. The cumulative catch at the end of week 27 was 3,440 fish over the weekly guideline harvest. CPUE for this week was $64 \%$ above the 1993-2002 average; this may have been due in part to water levels that were well below average.

The SW28 (starting July 6) fishery initially opened for three days. The inriver abundance estimate after Day 2 was approximately 56,000 sockeye salmon, the guideline harvest was 12,213 fish, and the catch to date was 10,084 fish, which left a balance of 2,129 fish for the remainder of the week's fishery. CPUE was $130 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ on Day 2 versus a weekly average of 94 $\mathrm{s} / \mathrm{f} / \mathrm{d}$. Canyon Island fishwheel CPUE on July 5 and 6 (Day 1 and to midnight on Day 2) was more than twice the average. An extension of one day was granted.
SW29 (starting July 13) initially opened for three days. At the close of Day 2, the opening was extended by two days based on the following: above average fishery CPUE (132 versus weekly average of $104 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), near-record Canyon Island fishwheel catches on July 13 and 14 (348 and 420 fish respectively, versus averages of 88 and 90 fish, respectively), and approximately 200 fish caught on the morning of July 15, as well as a significant surplus (at least 13,000 sockeye salmon) showing in the guideline harvest. Water levels were well above average for this opening; this may explain the fact that fishery CPUE was only slightly above average while fishwheel CPUE was near record. On Day 5, only two licensees fished due to closure of a landing station. CPUE did increase to 148 and $141 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ on days 3 and 4 but dropped to 42 on Day 5. The drop in Day 5 is believed to be have been related more to effort levels than to fish
abundance. At closing, there was a guideline harvest shortfall which ranged from 12,856 to 16,709 fish for one week early or average run timing, respectively.
Despite the surplus in the guideline harvest high fishery and fishwheel CPUE in the previous week, an opening of only 3 days was posted for SW30 (starting July 20). This was due to an anticipated drop in abundance as the Tatsamenie stock moved into the lower river. (In 2002, fishery CPUE dropped to only $59 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ in SW30). However, this concern appeared to be unfounded as both fishery and fishwheel CPUE were $60 \%$ above average and inriver abundance was estimated at 125,000 fish giving a guideline harvest of 41,500 fish. As a result of these favorable run status indicators, the fishery was extended by two days.
During the preseason TTC meeting it was agreed that a coordinated management focus would occur during SW31-33 (weeks beginning July 27, and August 3 and 10). The purpose of the management action was to increase the escapement of the Tatsamenie stock and provide sufficient broodstock for the joint fry-planting program. The preseason forecast, based on smolt emigration estimates, was for a run even lower that the one observed in 2002. Fishing time in U.S. Taku Inlet and the Canadian Inriver fisheries would be limited to two days unless agreed to by fishery managers of the two countries.

Consequently, SW31-33 were opened for two days each week. Fishery performance was above average in SW31 ( 159 versus $110 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), and average in SW32 ( 105 versus $109 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ ), however cumulative fishwheel CPUE for weeks 31 and 32 respectively was approximately $50 \%$ of average ( 9 each week versus averages of 19 and 15). Both openings ended as scheduled for the reasons noted above. In SW33 the Tulsequah flood peaked late on Day 1; only two licensees fished, with a landing of 139 sockeye salmon. The fishery was extended by one day to compensate for this. The total sockeye salmon landing for the week was 1,190 fish (Appendix C.4)

Due to poor market conditions, the commercial fishery was almost completely vacated at the end of SW33, which marked the start of the coho salmon season. Despite the fact that the fishery was open continuously from SW34 through SW40 (starting September 28), only one license holder fished. Landings of sockeye and coho salmon were 195 and 207 fish respectively in SW34 (starting August 17). The remainder of the catch (129 sockeye and 905 coho salmon) was harvested by the end of SW37 (starting September 7).
The cumulative fishery sockeye salmon CPUE for the season was $1,136 \mathrm{~s} / \mathrm{f} / \mathrm{d}, 28 \%$ above the 1993-2002 average of $885 \mathrm{~s} / \mathrm{f} / \mathrm{d}$. CPUE was above average for all weeks during the season except for weeks 32 and 35; the CPUE in SW of $4,750 \mathrm{~s} / \mathrm{f} / \mathrm{d}$ was a record for that week. Peak CPUE was observed in SW30, likely reflective of the strong run of Little Trapper Lake sockeye salmon (Appendix C.4); normally CPUE peaks in weeks 31 or 32.

## EsCAPEMENT

## Sockeye Salmon

Spawning escapement of sockeye salmon in the Canadian portion of the Taku River drainage is estimated from the joint Canada/U.S. mark-recapture program. Counting weirs operated by DFO at Little Trapper and Tatsamenie lakes provide information on the distribution and abundance of discrete spawning stocks within the watershed. A pilot study was conducted at King Salmon Lake by the TRTFN to estimate the number of sockeye salmon spawning in that system. A weir was
operated from August 4 to September 4, through which 697 sockeye salmon passed. On September 4, a spawning assessment was done by boat, and a total of 2,970 sockeye salmon (including 82 that possessed spaghetti tags) were counted.

The joint Canada/U.S. mark-recapture program has been operated annually from 1984 to 2003 to estimate the above-border run size (i.e., border escapement); spawning escapement is then estimated by subtracting the inriver catch. The 2003 estimate of border run is 200,918 sockeye salmon and the spawning escapement is estimated at 167,691 fish (Table 3). This spawning escapement is $70 \%$ higher than the 1993-2002 average of 98,694 fish (Appendix D.9), and is more than twice the mid-point of the interim escapement goal range of 71,000 to 80,000 sockeye salmon.

The sockeye salmon count through the Kuthai Lake weir was 7,769 fish, $53.9 \%$ above the 19932002 average count of 5,047 fish (Appendices C. 11 and D.10). The estimated number of females was 4,623 fish, which is $60.3 \%$ of the escapement, based on 642 live fish examined at the weir.
The Little Trapper Lake weir count was 31,227 sockeye salmon; this is the highest count since the weir was installed in 1983 and is 2.8 times the 1993-2002 average of 11,071 fish (Appendix D.10). The estimated number of females was 16,430 fish, which is $52.6 \%$ of the run, based on a sample of 749 live fish at the weir.
The Tatsamenie Lake weir count in 2003 was 4,515 sockeye salmon (Appendix C.9). This was 57\% of the 1995-2002 average 7,989 fish; it should be noted however that the 2001 count, which was more that twice the previous record, strongly influences this average (Appendix D.10). There were an estimated 2,716 females counted through the weir, or $60 \%$ of the count based on a sample of 680 live fish at the weir. A total of 845 females and 705 males were held for broodstock; gametes were collected from 622 females and 509 males. The total broodstock mortality was 48 females and 83 males. Totals of 129 females and 113 males were released unspawned on October 18 after the end of the egg-take; it is not known if any of these fish successfully spawned. The 845 females collected represented $31 \%$ of the estimated female escapement. (DFO guidelines limit broodstock collection to $30 \%$ of escapement). Prior to 1995, weir counts for the Tatsamenie system were made at Little Tatsamenie Lake and included fish which spawn between Little Tatsamenie and Tatsamenie lakes as well as fish which spawn in Tatsamenie Lake and its outlet stream. In 1995 the weir was moved upstream to Tatsamenie Lake. In 1994 weirs were operated at both Little Tatsamenie and Tatsamenie lakes; approximately $40 \%$ of the fish counted at the Little Tatsamenie weir did not migrate as far as the upper weir site at Tatsamenie Lake. It is felt however that using data from this particular year to estimate the escapement to the upper lake prior to 1994 might bias annual estimates high.

A pilot study was conducted at King Salmon Lake to estimate the spawning population in that system.

## Chinook Salmon

Spawning escapement of Chinook salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. mark-recapture program. Tag application occurred April 24 through July 24 (SW17-30). Tag recovery effort consisted of sampling commercial, test, and aboriginal gillnet fisheries from April 27 through October 4 (SW18-40), as well as spawning
ground sampling in August and September. The above-border mark-recapture estimate of 39,290 large Chinook salmon is within the escapement goal range of 30,000 to 55,000 fish.

Aerial surveys of large Chinook salmon to the six escapement index areas annually surveyed were: Nakina, 2,126 fish; Kowatua, 850 fish; Tatsamenie, 1,066 fish; Dudidontu, 644 fish; Tseta, 436 fish; and Nahlin, 861 fish (Figure 9, Appendix D.12). The total of 5,418 large Chinook salmon (Tseta counts are no longer included in the index total) observed was $61 \%$ of the 19932002 average of 9,058 fish.

A carcass weir was again operated by the TRTFN on the Nakina River to obtain tag and age-length-sex data on Chinook salmon. A total of 2,680 carcasses were enumerated at the weir (Appendix C.12).

## Coho Salmon

Spawning escapement of coho salmon in the Canadian portion of the Taku River drainage was estimated from the joint Canada/U.S. mark-recapture program. Tag application occurred through October 8 (SW40) and tag recovery occurred through October 8 (SW41). The recovery effort consisted of sampling the commercial, test, and aboriginal fishery catches. The above-border run estimated to be 186,755 fish, the second highest on record, and the spawning escapement was estimated at 183,038 fish (Appendices C. 8 and D.12). The spawning escapement is more than twice the 1993-2002 average of 84,916 fish and almost five times the upper limit of the interim escapement goal range ( 27,500 to 35,000 fish).

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels provide an index of annual variation in border escapement. Pink

Figure 9. Taku River Chinook salmon index escapement counts, 1975-2003.
salmon escapement to the Taku River was characterized as above average. A total of 15,492 pink salmon were caught and released in the Canyon Island fish wheels in 2003 (Appendix D.15), which is $24 \%$ above the 1993-2002 average of 12,517 fish.

## Chum Salmon

As with pink salmon, there was no program in place to estimate the system-wide escapement of chum salmon. A total of 268 chum salmon was caught and released in the Canyon Island fish wheels, $88.6 \%$ of the 1993-2002 average of 302 fish (Appendix D.15). The Taku River fall chum salmon run has been depressed since 1988. It is unlikely that the spawning escapement goal of 50,000 to 80,000 chum salmon was achieved in 2003.

## Steelhead Trout

There was no program in place to estimate the system-wide steelhead trout escapement. An escapement goal has not been set for this species. A total of 93 steelhead trout was caught and released in the Canyon Island fish wheels in 2003, which is near the 1993-2002 average of 97 fish (Appendix D.15).

## ALSEK RIVER

Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 10). Unknown quantities of Alsek River origin fish are also taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 10).

Figure 10. The Alsek River and principal U.S. and Canadian fishing areas.

## Harvest Regulations \& Management Objectives

Although catch sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV does call for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook, sockeye and coho salmon. Interim escapement goal ranges for Alsek River sockeye and coho salmon were initially set by the TTC at 33,000 to 58,000 sockeye, and 5,400 to 25,000 coho salmon. The principle escapement-monitoring tool for Chinook, sockeye, and coho salmon stocks on the Alsek River is the Klukshu weir, operated by DFO and the Champagne-Aishihik First Nation (CAFN). The weir has been in operation since 1976. To make the management objectives of Chinook and sockeye salmon better defined in terms of Klukshu stocks, revised goals, expressed in terms of Klukshu stocks only, were established in 1999 and adopted again in 2003. Mark-recapture programs to estimate the total inriver abundance and the fraction of the escapement contributed by the Klukshu stocks have been in operation since 1997 for Chinook salmon and since 2000 for sockeye salmon.
The initiative to establish a specific Klukshu Chinook salmon spawning goal began in 1991 when the TTC set an interim spawning objective of 4,700 Klukshu Chinook salmon. This goal was based more on manager's intuition than on science. From 1995 through 1997, the TTC reviewed this escapement level and concluded that goal of 4,700 Chinook salmon was not supported by the data. A new goal range of 1,100 to 2,300 fish was proposed based on joint analyses of stock-recruitment data. The Parties conducted independent internal reviews of these analyses. Although there was not unanimous support for the proposal, there was agreement on establishing a minimum goal consistent with the lower end of the proposed range. As a result, Canadian and U.S. managers agreed to a minimum spawning escapement goal of 1,100 Chinook salmon for the Klukshu system for 2000 and this was used again in the 2003 season.

The stock-recruitment analysis of Klukshu sockeye salmon data has been completed and has undergone internal peer review. The new escapement goal range for Klukshu River sockeye salmon is 7,500 to 15,000 spawners per year.

## Preseason Forecasts

The overall sockeye salmon run to the Klukshu River in 2003 was expected to be slightly above average in strength. Principal contributing brood years to the 2003 run were expected to be 1998 (Klukshu escapement of 13,580 fish) and 1999 (Klukshu escapement of 5,101 fish); the 19932002 average Klukshu escapement was 12,484 fish. Based on historical stock-recruitment analysis, the range of Klukshu escapements that appear most likely to produce maximum sustained yields is 7,500 to 15,000 sockeye salmon.

The 2003 overall Alsek River sockeye salmon run was expected to be approximately 68,800 fish. This estimate was based on: a predicted run of 17,200 Klukshu sockeye salmon derived from the average of the historical Klukshu stock-recruitment data and an assumed Klukshu contribution of $25 \%$. A run size of this magnitude is slightly above the 1993-2002 average run size estimate of approximately 66,400 fish (based on the Klukshu weir count expanded by $1 / 0.25$ to account for other inriver escapement and an assumed U.S. harvest rate of 20\%).

The Klukshu early run sockeye salmon escapements in 1998 and 1999 were 597 and 371, respectively (Appendix E.7). Both the 1997 and 1998 escapements were well below the optimum level of 2,500 sockeye salmon spawners as determined through separate stock-recruitment analyses by DFO of the early run. Due to the under escapement in 1997 and 1998, the early run was expected to be well below average.

The Klukshu Chinook salmon escapements in 1997 and 1998, 2,800 and 1,350 fish, respectively, were above average and well below average (Appendix E.7). The escapements for 1997 and 1998 were above and near the lower end of the optimum escapement range of 1,100 to 2,300 Chinook salmon estimated from current stock-recruitment analysis. As a result, the preliminary outlook was for a below average run. The 2003 overall Alsek River Chinook salmon run was expected to be approximately 16,100 Chinook salmon. This estimate was based on: a predicted run of 2,700 Klukshu Chinook salmon derived from the historical Klukshu stock-recruitment data; and an assumed Klukshu contribution to the total run of approximately $17 \%$.

The coho salmon escapements observed at the Klukshu River in 1999 (2,500 coho salmon but incomplete count) and 2000 ( 4,800 coho salmon) suggests the run in 2003 would be slightly above average (Appendix E.7). The 1993-2002 average escapement was approximately 2,900 coho salmon.

## U.S. FISHERIES

The Dry Bay commercial set gillnet fishery harvested an estimated 937 Chinook, 39,698 sockeye, and 47 coho salmon. No pink or chum salmon were taken in the fishery (Figures 11-14, Appendices E. 1 and E.4). The estimate of the Chinook salmon harvest was 55\% above the 19932002 average of 607 fish, the sockeye salmon harvest was 2.2 times the average of 18,074 fish, and the coho salmon harvest was $0.7 \%$ of the average of 6,464 fish. The fishery was open for 60 days, above the 1993-2002 average of 51 boat-days (Appendix E.4). Weekly fishing time remained fairly constant at three days for almost the entire season. The total effort expended in the fishery was 271 boat-days, $65.0 \%$ of the 1993-2002 average of 471 boat-days. The estimate of subsistence harvests included 176 sockeye, 24 Chinook, and 27 coho salmon (Appendix E.5).

The Alsek River commercial fishery opened on the first Monday in June, statistical week 23 (June 2) (Appendix E.1). The initial opening was for 24 hours. For the next two weeks of the season weekly openings were extended to 72 hours because sockeye salmon CPUE remained more than triple the average. The fourth opening was limited to 48 hours when CPUE dropped to double the average. Beginning the first week of July fishery performance remained very strong through the end of the sockeye salmon season and all weekly periods remained at 72 hours. The fishery targeted coho salmon stocks after late August and fishing times were maintained at 3 days per week for the entire coho salmon season.

Figure 11. Average catches and fishing efforts compared with 2003 values for the Alaska Alsek River commercial fishery and the Canadian aboriginal and sport fisheries in the Alsek River.

Figure 12. Alsek River sockeye salmon catches and weir counts, 1979-2003.

Figure 13. Alsek River Chinook salmon catches and weir counts, 1979-2003.

Figure 14. Alsek River coho salmon catches and weir counts, 1979-2003.

Historically, a set gillnet fishery targeting on Chinook salmon was conducted during May and early-June. Due to depressed runs, the directed fishery has been closed since 1963 and Chinook salmon have only been harvested incidentally during the sockeye salmon fishery in early June. From 1963 through 1997, the early June periods were limited in time in order to reduce the impact on Chinook salmon. With the advent of the new Chinook salmon escapement goal concern for incidentally caught Chinook salmon has diminished, therefore the management of the early June periods was based on sockeye salmon CPUE. Gillnet mesh size was restricted to a maximum of six inches through July 1.

## CANADIAN FISHERIES

The aboriginal fishery harvested an estimated 90 Chinook, 2,734 sockeye, and no coho salmon (Figures 11-14, Appendices E. 2 and E.6). The estimated Chinook salmon catch was $38 \%$ of the 1993-2002 average of 242 fish. The sockeye salmon catch was 2.1 times the average of 1,277 fish; the average coho salmon catch is 29 fish.
Catch estimates for the Tatshenshini recreational fishery were below average for Chinook and sockeye salmon with an estimated 138 Chinook and 61 sockeye salmon harvested, and above average for coho salmon with 192 fish harvested. These represent 44\% of the 1993-2002 average for Chinook, $39 \%$ for sockeye, and $177 \%$ for coho salmon. The low Chinook and sockeye salmon catches have been attributed to the changed river channel (i.e., fewer holding areas below the Tatshenshini/Klukshu rivers confluence) and to the relocation of the Klukshu weir in 2001, which has allowed migrating salmon to stage further up from Dalton Post in the Klukshu River. Retention of sockeye salmon in the Tatshenshini River was permitted starting on August $15^{\text {th }}$ as per regulation. By August $30^{\text {th }}$, the upper end of the escapement goal had been exceeded and it was decided to increase the daily sockeye salmon limit to 4 fish ( 8 fish in possession) starting on September 6. High coho salmon counts at the Klukshu weir prompted an increase in the daily coho salmon recreational catch limit from two per day to four on October $9^{\text {th }}$. The preliminary catch data was derived from a creel census in the Dalton Post area and a catch card program conducted by the Yukon Salmon Committee (YSC) and DFO. Weekly estimates and annual comparisons are listed in Appendices E. 2 and E.6.
Management of salmon in the Yukon is a shared responsibility between DFO and the Yukon Salmon Committee (YSC). The YSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the YSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

The 2003 Alsek-Tatshenshini management plan, adopted by CAFN, YSC, and DFO, was based on the objectives described in the Harvest Regulations \& Management Objectives section above. For Chinook and early run sockeye salmon management, the status of the Klukshu weir counts was to be reviewed on or about July 18 to ensure weir and spawning escapement targets were on track. The status of the late run sockeye salmon would be reviewed the first week of September. Adjustments to inseason fishing regimes in the sport and aboriginal fisheries would be made if deemed necessary. Other key elements of the plan are described below.

The center of aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff and traditional fish traps as the fish migrate up the Klukshu River into Klukshu Lake. The fishing plan for the aboriginal fishery in the Klukshu River for the period prior to August 15 allowed fishing by means of fish traps for 2 days per week. After August 15, it was planned that the traps would be fished 3 days per week. Conservation thresholds that might invoke restrictions in the Aboriginal fishery were projected Klukshu weir counts of $<1,100$ Chinook and $<1,500$ early sockeye salmon. Gaff fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The plan did not restrict the gaff fishery other than to reserve Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the recreational fishing effort on this drainage occurs on the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 unless the weir count projection for the early run was $>4,500$ sockeye salmon. The Chinook salmon daily catch limit was one fish and the possession limit was 2 Chinook salmon. For other salmon species, the daily catch and possession limits were 2, and 4 fish, respectively. However, the aggregate limit for all salmon combined was 2 salmon per day, 4 fish in possession. Starting in 2003, salmon fishing was permitted in the Tatsheshini River seven days a week; this fishery had previously been open from 6:00 am Saturday to 12:00 noon Tuesday each week. Headwater areas upstream of the British Columbia/Yukon border were to be closed for the season to protect spawning Chinook salmon. Conservation thresholds that were expected to invoke additional restrictions in the sport fishery were projected Klukshu weir counts of $<1,500$ Chinook and $<10,600$ sockeye salmon (early and late runs combined).

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the YSC in 1999, was required by all recreational salmon fishers in 2003. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon recreational fishery. Anglers are required to report their catch via mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River Bridge crossing up to the new weir location to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini confluence.

## EsCAPEMENT

Total drainage abundance programs are being implemented as part of the development of abundance-based management regimes and to accurately assess whether the system-wide escapement goals for Alsek River Chinook and sockeye salmon stocks are appropriate and if so, are being achieved. At this time, there are no programs in place to estimate the drainage-wide coho salmon escapement. A large and variable proportion of the escapement of each species is enumerated at the weir on the Klukshu River. Current escapement monitoring programs including the Klukshu weir, Village Creek electronic counter, and aerial surveys allow annual comparisons of escapement indices. The most reliable long-term comparative escapement index
for Alsek River drainage salmon stocks is the Klukshu River weir count. Escapements for 2003 are shown in Table 6.

## Sockeye Salmon

The weir count and escapement estimates of Klukshu River sockeye salmon were 34,362 and 32,120 fish respectively in 2003 (Table 6, Appendices E. 3 and E.7). The count of 3,084 early run fish (count through August 15) was $94 \%$ of the 1993-2002 average of 3,299 fish while the count of 31,278 late run fish was 3.1 times the average of 9,983 fish. The total escapement was a record, was 2.6 times the average escapement of 12,484 sockeye salmon, and was more than twice the upper end of the recommend escapement goal range of 7,500 to 15,000 fish. The sockeye salmon escapement estimate at the Village Creek counter of 4,340 fish in 2003, was 70.4\% higher than the 1993-2002 average of 2,547 fish (Appendix E.9).

Table 6. Catch and Klukshu index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2003.

|  | Sockeye | Chinook | Coho |
| :--- | ---: | ---: | ---: |
| Inriver Run from Mark-Recapture | 90,088 | 4,989 | $\mathrm{~N} / \mathrm{A}$ |
| Escapement Index ${ }^{\text {a }}$ |  |  |  |
| Klukshu Weir Count | 34,362 | 1,737 | 3,689 |
| Klukshu Escapement | 32,120 | 1,661 | 3,689 |
|  |  |  |  |
| Harvest ${ }^{\text {b }}$ |  |  |  |
| U.S. Commercial | 39,755 | 942 | 47 |
| U.S. Subsistence | 176 | 24 | 27 |
| Canadian Sport | 61 | 138 | 192 |
| Canadian Aboriginal | 2,734 | 90 | 0 |
| Total | 42,609 | 1,115 | 149 |

${ }^{\text {a }}$ Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
${ }^{\mathrm{b}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than the listed fisheries.

A sockeye salmon mark-recapture program was initiated in 2000 to explore the feasibility of developing an abundance-based management regime for Alsek River sockeye salmon and this was continued through 2003. The modified Peterson estimate of the inriver run above Dry Bay is approximately 90,088 sockeye salmon ( $\mathrm{m}=1,815$, $\mathrm{r}=111$, $\mathrm{c}=5,554$ ), with a $95 \%$ confidence interval of 74,927 to 108,287 fish (Appendix E.8). The Klukshu weir count therefore represented approximately $38 \%$ of the total Alsek inriver run in 2003. The estimated contribution of Nesketaheen sockeye salmon to the total Alsek River run was approximately 5\%. The radio tagging study, which was initiated in 2001 to determine the run timing and distribution of sockeye salmon in the Alsek River drainage, was continued for the final year in 2003. In total, 335 radio tags were applied to migrating sockeye salmon captured above the U.S. commercial fishery. To date, analysis of the radio tagging data has not been completed.

Historical aerial survey counts for other Alsek River index tributaries are listed in Appendix E.9.

## Chinook Salmon

The most reliable comparative Chinook salmon escapement index for the Alsek River drainage is the Klukshu River weir count. The Chinook salmon weir and escapement counts in 2003 were 1,737 and 1,661 fish respectively (Table 6), and were both $61 \%$ of the 1993-2002 averages of 2,828 and 2,716 fish, respectively (Figure 13, Appendix E.7). The 2003 escapement was within the revised interim escapement goal range of 1,100 to 2,300 Klukshu Chinook salmon.

Aerial Chinook salmon surveys were again flown in 2003. The count of 127 Chinook salmon in the Blanchard River was $46 \%$ of the 1993-2002 average of 275 fish, the 10 fish counted at Goat Creek was $22 \%$ of the average of 45 fish, and the count of 105 fish for the Takhanne River was $4 \%$ of the average of 236 fish (Appendix E.10).

A Chinook salmon mark-recapture study was conducted again in 2003. The estimated inriver run past Dry Bay for Alsek River Chinook salmon was 4,849 large fish (Appendix E.11). The Klukshu escapement of 1,358 large fish represents approximately $32 \%$ of the total large Chinook salmon escapement.

## Coho Salmon

The Klukshu weir count and escapement of 3,689 fish are both $26 \%$ higher than their respective averages for 1993-2002, (Table 6). The weir is removed prior to the completion of the coho salmon run and typically does not include fish that migrate after mid-October. (Figure 14, Appendix E.12)

## Sockeye Salmon Run Reconstruction

Estimates of the Klukshu contribution to the sockeye salmon run to the Alsek River drainage vary from $14 \%$ from the mark-recapture study in 2000 to $38 \%$ from the mark-recapture study done in 2003 (Appendix E.8). For 2003, the estimated inriver run above Alsek Lake was 90,088 sockeye salmon (Table 6). The Canadian aboriginal and sport catch estimates of 2,795 fish left a spawning escapement of 87,293 fish. The estimated U.S. subsistence and commercial catch of 39,874 sockeye salmon added to the inriver run produce an Alsek inriver run estimate of approximately 129,962 sockeye salmon (Appendix E.8).

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2003, sockeye salmon eggs were collected at Tahltan Lake on the Stikine River for the sixteenth year, and in the Tatsamenie Lake system on the Taku River, for the fourteenth year of this program.

## Tahltan Lake

The egg collection was contracted to Arc Environmental Ltd. for the seventh consecutive year. The first large escapement since 1996 provided good numbers of brood stock. Collection of fish was much easier in comparison with recent years. An estimated 5.4 million eggs were collected from 1,936 females and milt was collected from 1,961 males (Appendix A.17). The estimated egg collection is based on eyed egg processing completed at the hatchery; the average fecundity is 2,700 eggs per female. The brood stock was collected by beach seine at the major spawning site as has been done in most years. Fish were not collected from other sites due to several
constraints. The eggs were collected on thirteen distinct egg-take days. Due to inclement weather, eggs collected on September 1 and 13 were delayed in shipment to the hatchery by one and two days, respectively. The egg-take goal at Tahltan Lake is 6.0 million eggs.

## Tatsamenie Lake

Tatsamenie Lake brood stock was captured for the tenth year at an adult enumeration weir located at the outlet of Tatsamenie Lake. Egg collection was again contracted to B. Mercer and Associates Ltd. A total of 799 females and 705 males were held prior to the first egg take on September 19. The held brood stock represented $33 \%$ of the 2003 sockeye salmon escapement ( 4,515 fish) into Tatsamenie Lake (Appendix C.9). An estimated 2.82 million eggs were collected (based on a hatchery estimate of egg counts and a fecundity of 4,223 eggs per female) from 622 females and milt was collected from 509 males during 6 egg collections. Mortality of held fish included 48 females and 83 males; the remaining 129 females and 113 males not used for gamete collection were released on October 18 and it is not know if any of the fish spawned successfully. Investigation of a passive flow incubator continued at the lake with 195,500 eggs collected from 46 females and placed in the incubator on October 10. the results from this experiment will be reported in the 2004 Transboundary Technical Committee Report.

## Incubation, Thermal Marking, and Fry Plants (2002 Brood Year)

The egg incubation and thermal-marking program at Snettisham Hatchery went smoothly in year 2002/2003. Snettisham hatchery is operated by DIPAC (Douglas Island Pink and Chum, Inc.), a private aquaculture organization in Juneau. A co-operative agreement between ADF\&G and DIPAC provides for Snettisham hatchery to serve the needs of the joint TBR enhancement projects.

Incubation of 2002 brood eggs took place at Snettisham Hatchery and the resultant fry were transported to the appropriate systems from May 21 to June 12, 2003. An estimated 484,000 Tatsamenie Lake sockeye salmon fry in three incubators were lost to the IHN virus.

## Tahltan Lake

A total of 2.623 (Appendix F.1) million fry from the 2002 Tahltan sockeye salmon egg take was planted back into Tahltan Lake in 2003 (Appendix F. 1 and F.2). Survival from green-egg to outplanted fry was $93 \%$. Fry outplanting took place from May 21 to May 28 (Appendix F.17).

## Tuya Lake

There were 1.24 million fry planted in Tuya Lake on June 12, 2003. These fish were from eggs collected at Tahltan Lake in the fall of 2002. Survival from green-egg to outplanted fry was $89 \%$ (Appendix F.2).

Tatsamenie Lake
A total of 0.92 million fry from the 2002 egg-take was released into Tatsamenie Lake in 2003, and additional 0.442 million fry were placed in a net pen in the lake for feeding, but were lost to IHNV. Survival from green-egg to outplanted-fry was $54 \%$ (Appendix F.3). Low survival was partially due to loss of three incubators to IHNV. Outplanting took place from May 21 to May 27.

The loss of Tatsamenie fry to IHNV both during incubation at Snettisham and during the net pen rearing at Tatsamenie Lake is an expected consequence of the culture of sockeye salmon. The
strategy of compartmentalization and isolation provides assurance that losses are kept to a minimum. The incidence in of the IHN virus in the brood stock was one of the highest we have seen in 2002.

The Appendix F tables summarize enhancement activities for 2003 and prior years.

## OUTPLANT Evaluation Surveys

## Acoustic, Trawl, Beach seine and Limnological Sampling

In 2003, surveys were directed by the Salmon Indexing Methods Unit of Stock Assessment Division of the Pacific Biological Station (PBS) and the Yukon/Transboundary Stock Assessment section of Fisheries and Oceans Canada. Limnological, beach seine, hydroacoustic and trawl surveys were conducted at Tatsamenie Lake by B. Mercer \& Associates. A spring limnological survey that included beach seining was conducted by B. Mercer \& Associates at Tuya Lake and an early August survey that included index netting, hydroacoustic surveys and trawling was conducted by the PBS. Limnological and beach seine surveys were performed at Tahltan Lake by onsite Fisheries and Oceans Canada (DFO) personnel.

Fry otoliths were examined at DFO’s thermal mark lab in Whitehorse, Yukon. Data analyses will take place during the winter of 2003/2004. Limnetic fish population estimates (rounded to the nearest 100,000 ), density estimates and beach seine catches are presented in various tables in Appendix F. The limnetic sockeye salmon fry population estimates are based on acoustic surveys and trawl samples only; beach seine catches are not used. Currently, beach seine catches serve as a qualitative index of the abundance of fish in the littoral zone, and provide samples to evaluate the proportion of wild to outplanted hatchery fry and length and weight data. Limnetic fry density estimates are made from the sounding transects. Each lake is divided into a number of transects and each transect is further divided into a number of depth strata.

## Smolt Enumeration And SAMPLING

Smolt sampling and enumeration programs were conducted at Tahltan and Tatsamenie lakes. Sampling and enumeration at Tahltan Lake was conducted by DFO, Whitehorse, as part of the continuing smolt program. B. Mercer and Associates, on contract to DFO, performed the work at Tatsamenie Lake.

## Tahltan Lake

The Tahltan smolt enumeration program uses a fence and modified inclined plane traps to capture all emigrating smolts. Volumetric displacement techniques are employed to determine the total smolt run size. The 2003 smolt population was estimated to be 1,960,480 fish; approximately $50 \%(981,000)$ these fish originated from fry plants based on otolith interpretation (Appendix B.24)

## Tuya Lake

Smolt sampling was not conducted at Tuya Lake in 2003.

## Tatsamenie Lake

At Tatsamenie Lake, capture of smolts for sampling as well as for obtaining a mark-recapture population estimate was conducted over a six-week period using a fyke net, with attached wing nets. A total of 41,754 smolts were captured and 10,500 smolts were marked for the population
estimate (Appendix F.11). Recaptures of marked fish were used to develop weekly population estimates, which were then identified as wild and hatchery fish based on thermal mark analyses. From the captured smolts 597 representative samples were retained for length and weight sampling and the heads preserved for thermal mark analysis. The overall age composition of the smolts captured was $98 \%$ age $1+$ and $2 \%$ age $2+$ based on scale examination and weighted sampling.

The smolt population estimate developed using the Stratified Population Analysis System (SPAS) generated Maximum Likelihood Darroch estimator is 539,500 fish (S.E. 22,500). The hatchery age $1+$ component was estimated to be 72,098 age $1+$ smolts; 39,004 of these smolts were from a fed release group while 33,094 were from an unfed release group.
The estimate of the survival of the brood year 2001 fry outplants to age $1+$ smolt was $3.5 \%$. The fry to smolt survival was $2.7 \%$ for fed fry and $5.4 \%$ for unfed fry. The unfed group was released in May while the fed groups were released from mid- to late June.
The egg to age $1+$ smolt survival for BY 2001 wild fry was $1.1 \%$ whereas the egg to age $1+$ smolt survival for fed and unfed fry was $1.9 \%$ and $3.8 \%$, respectively.

## Short Term Fry Holding and Feeding

Short-term pen holding of transported fry was conducted at Tahltan Lake. The primary objective of this outplant procedure was to assess post-transport mortality rates. Five shipments of sockeye salmon fry were received on May 21, 27, and 28. All fish were held for a period of approximately 24 hours and none of the fish were fed. The number of observed mortalities is unavailable, however it was very low.

At Tatsamenie Lake, two unfed groups of outplanted fry were released directly into the lake and a portion were fed. Unfortunately the fed fish was destroyed due to an IHNV outbreak. The Tatsamenie fry were transported in three shipments, one in May 21 and two shipments on May 27. The fry were released onshore 5 km from the south end of the lake on the west side and at 5 sites on within 2-3 km of the north end of the lake.

## Tatsamenie Lake Passive Flow Incubators

One passive flow incubator, of similar design to those successfully tested in prior years, was seeded with eggs at Tatsamenie Lake in October 2003. The incubator was filled with a total of 195,000 eggs.

The purpose of the incubator incubation is to determine if in-lake incubation will confer a survival advantage over the fry incubated at the hatchery. Differential survival between in-lake and hatchery incubated fry may help to determine the cause(s) of the low survival of fry planted into Tatsamenie Lake. We intend to continue with passive flow incubator assessment, despite some discouraging losses in 2001.

## Thermal Mark Laboratories

## ADF\&G Thermal Mark Laboratory

During the 2003 season the ADFG thermal mark lab received otoliths from 13,085 sockeye salmon collected by ADFG and DFO staff as part of the U.S./Canada fry-planting evaluation program. These collections came from commercial and test fisheries in U.S. waters and in Canadian fisheries on the Taku and Stikine Rivers over a 12-week period. In addition, several escapement samples
were examined. Combined, the laboratory processed 12,976 of the otoliths received (99\%) and provided estimates on hatchery contributions for almost 100 distinct sampling collections. Of these totals, 2,260 otoliths were identified and classified as belonging to one of 30 marked groups. Estimates of the percentage of hatchery fish contributed to commercial fishery catches were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.
Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate the weekly contribution of planted sockeye salmon to the District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku Rivers. Contributions of planted sockeye salmon stocks to catches were as follows: 16,612 planted Stikine River fish to District 106 and 108, and 773 planted Taku River fish to District 111 (includes inriver personal use fishery). Estimates of contributions to Canadian fisheries included 25,125 planted Stikine River fish to Stikine River fisheries and 271planted Taku River fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Sub-samples of juvenile and adult otolith samples collected at the study lakes during the 2003 season are being analyzed at the DFO thermal mark lab in Whitehorse. It is anticipated that results will be completed by March 2004.

## APPENDICES

Appendix A.1. Weekly salmon catch in the Alaskan District 106 commercial drift gillnet fisheries, 2003. Effort may be less than the sum of effort from 106-41\&42 and 106-30 because some boats

| Week | StartDate | Catch |  |  |  |  | Effort |  |  |

${ }^{\text {a }}$ Jacks as reported by fishery and loosely based on "small" fish $\sim 2.5-3.0 \mathrm{~kg}$; the jack catch may not correspond with the estimated jack catch based on sampling, I.e. jack $<660$ mef or $<735 \mathrm{fl}$.

Appendix A.16. Weekly catch, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye stocks in the Stikine test fishery, 2003. Sex specific age compositions were calculated and the smoothed stock compositions of the females sampled for egg diameters was expanded to the catch by age.

${ }^{a}$ Average proportions were from averages of weekly estimates.

Appendix B.21. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye stocks, 1979-2003. Stock compositions based on: scale circuli counts 1979-1983; SPA in 1985; average of SPA and GPA 1986-1988; and egg diameter analysis in 1989-2003. 1994-2000 and 2003 data from commercial catch. Estimates for 2001-2002 are from the test fishery.

Appendix D.4. Salmon catch in the U.S. subsistence and personal use fisheries in the Taku River, 19672003. The subsistence fishery was open 1967 to 1976 and 1985 and the personal use fishery was open 1989-2003. The harvests are minimum estimates because not all permits are filled out and returned.

${ }^{a}$ Weir count plus spawning ground survey for Trapper 83, 85, 87.
${ }^{\mathrm{b}}$ Weir counts are incomplete for Kuthai 92, Nahlin 88, 92.
${ }^{\text {c }}$ Counts may be low due to uncounted fish passage past weir for Crescent 88-90, Speel 90, Kuthai 93.
${ }^{\text {d }}$ Mark-recapture estimates for Crescent 91, 92 Speel 95.
${ }^{e}$ In 1995 the weir was moved upstream to Tatsamenie Lake, the count of 8,000 is an expansion (based on past experience) of the 5,780 fish counted there.
${ }^{\mathrm{f}}$ The estimated return of 10,381 through the Tatsamenie Lake weir in 1996 is thought to represent approximately $80 \%$ of the sockeye run past the old weir location at Little Tatsamenie Lake. This results in a potential run of 12,976 sockeye salmon.
${ }^{\mathrm{g}}$ The estimated return of 8,363 through the Tatsamenie Lake weir in 1997 is thought to represent approximately $80 \%$ of the sockeye run past the old weir location at L. Tatsamenie Lake resulting in a potential run of 10,454 sockeye.
${ }^{\mathrm{h}}$ The estimated count of 5,997 fish through Tatsamenie Lake weir in 1998 does not include an estimated 1,499 fish spawning in the outlet stream i.e. total estimate 7,496.
${ }^{\mathrm{i}}$ Minimum estimates of run size.
${ }^{j}$ In 2002 the Trapper weir count was expanded by $69 \%$ migratory timing to account for fish passage during high water and the Kuthai weir count had 102 fish removed for an aboriginal food fishery.

Appendix D.11. Taku River chinook salmon run size, 1979-2003. Run estimate does not include spawning escapements below the U.S./ Canada border.

${ }^{\text {a }}$ In years when sample size data is available (1999-present in the commercial and test fisheries, and 2003-2004 in the Aboriginal fishery) it was used to determine the number of large fish in the Canadian harvest. In years when sample data is not available, the average \% large in the commercial fishery from 1999-2004 (75\%) was applied to all catches except the recreational catch, which is assumed to be $100 \%$ large and comprise 300 fish annually. Catches may differ from those in Appendix D. 5 and D. 7 because of different definitions of large fish and jacks.
${ }^{\mathrm{b}}$ U.S. catch includes D111 commercial gillnet and Juneau area sport fishery harvests; the estimate of large fish for the commercial fishery includes age-1.3 and older fish; all sport harvests are assumed to be large fish.

Appendix D.12. Aerial survey index escapement counts of large (3-ocean and older) Taku River chinook salmon, 1975-2003.

${ }^{\mathrm{a}}$ Weir count combined with spawning ground count.
${ }^{\mathrm{b}}$ Incomplete weir count.
${ }^{\text {c }}$ Count is an average of surveys by different observers.
${ }^{\mathrm{d}}$ Includes mark-recapture estimate.
${ }^{\mathrm{e}}$ Poor survey conditions.
${ }^{\mathrm{f}}$ Foot survey.
${ }^{\mathrm{g}}$ Surveys conducted before peak abundance on spawning grounds.

Appendix E.2. Weekly salmon catch and effort in the Canadian Aboriginal and sport fisheries in the Alsek River, 2003. Total catches do not include released fish.

${ }^{\text {a }}$ Includes estimates of sport catch (kept and released) in Takhanne and Blanchard rivers; estimates based on salmon catch card information.
${ }^{\mathrm{b}}$ Does not include released fish.
${ }^{\text {c }}$ Aboriginal catches are reported and are believed to represent $90 \%$ of the absolute catches
${ }^{d}$ The total food fish catch above the Klukshu Weir and at Village Creek are included in the weekly aboriginal catches.

Appendix E.3. Daily counts of salmon passing through Klukshu River weir, 2003.

${ }^{\text {a }}$ Counts include jack chinook salmon.
${ }^{\mathrm{b}}$ Weir was removed prior to the end of the coho run.
${ }^{\text {c }}$ The chinook and sockeye escapements into Klukshu Lake are calculated from the weir count minus fish harvested above the weir site minus brood stock taken. The remainder of the food fishery harvest occurred below the weir, at Village Creek, and Blanchard and Takhanne Rivers.
${ }^{\mathrm{d}}$ Includes sockeye counts up to and including August 15.

${ }^{2}$ The first fry outplant occurred in 1992 from BY 91.
${ }^{\mathrm{b}}$ One age-3. Smolt was captured at Tuya Lake in 1997.
${ }^{\mathrm{c}}$ The smolt outmigration in 1999 (BY 97) was the first year in which samples contained otoliths with no thermal marks.

${ }^{\text {a }}$ There are no sample sizes available for 1992-1996 and no population estimates for 1992-1995 and 1997.
${ }^{\mathrm{b}}$ Smolt numbers are estimated from smolt mark-recapture programs, age-specific estimates were derived from weighted sample ratios.
${ }^{\mathrm{c}}$ Measurements are from fresh, unpreserved fish.
${ }^{\mathrm{d}}$ The first fry were outplanted in 1991 (BY90).
e A total of $14.9 \%$ (71) were of enhanced origin.

Appendix F.22. Acoustic estimates of limnetic fry populations in transboundary lakes.

[^0]:    ${ }^{\text {a }}$ does not include test fishery catches

[^1]:    ${ }^{\text {a }}$ There was no test fishing during statistical weeks 25-34 inclusive.

[^2]:    ${ }^{2}$ Eggs not transported but placed in inlake incubator; $2000=244,000,2001=865,000,2002=196,000,2003=196,000$.
    ${ }^{\mathrm{b}}$ Survival rates are for hatchery eggs and hatchery fry plants and do not include the lake incubators.

[^3]:    ${ }^{\text {a }}$ Does not include a count of 1,899 age 4+ smolts.

[^4]:    *Average fecundity of 2700 was used for years of no brood stock collection. Fecundity was determined from hatchery egg receipts for other years.

[^5]:    * Other groups include only Diaphanosoma sp., Chydoridae and Harpacticoid copepods.
