Appendix B. 27. Weir counts of Chinook salmon at Little Tahltan River, 1985-2006. ..... 107
Appendix B. 28. Index counts of Stikine Chinook escapements, 1979-2006. Counts do not include jacks (fish < 660 mm mef length). ..... 108
Appendix B. 29. Index counts of Stikine coho salmon escapements, 1984-2006. ..... 109
Appendix B. 30. Stikine River sockeye salmon run size, 1979-2006. ..... 110
Appendix C. 1. Weekly salmon catch and effort in the Alaskan District 111 and Subdistrict 111- 32 (Taku Inlet), commercial drift gillnet fishery, 2006. ..... 112
Appendix C. 2. Estimate of the proportion of natural and planted sockeye salmon stock groups harvested in the Alaskan District 111 commercial drift gillnet fishery by week, 2006 ..... 114
Appendix C. 3. Weekly stock-specific catch of wild and planted Taku River and Port Snettisham sockeye salmon harvested in the Alaskan District 111 commercial drift gillnet fishery, 2006. . 114 Appendix C. 4. Weekly salmon and steelhead trout catch and effort in the Canadian commercial fishery in the Taku River, 2006. ..... 115
Appendix C. 5. Weekly stock proportions of sockeye salmon harvested in the Canadian commercial fishery in the Taku River, 2006 ..... 115
Appendix C. 6. Weekly stock-specific catch of sockeye salmon in the Canadian commercial fishery in the Taku River, 2006. ..... 116
Appendix C. 7. Weekly salmon and steelhead trout catch and effort in the Canadian test fishery in the Taku River, 2006. ..... 116
Appendix C. 8. Mark-recapture estimate of above border run of Chinook, sockeye, and coho salmon in the Taku River, 2006. ..... 117
Appendix C. 9. Daily counts of adult sockeye salmon passing through Tatsamenie weir, 2006. ..... 118
Appendix C. 10. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2006 ..... 119
Appendix C. 11. Daily counts of adult salmon passing through the King Salmon Lake weir, 2006 ..... 120
Appendix C. 12. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2006 ..... 121
Appendix C. 13. Daily counts of large (>659mm MEF length) Chinook salmon carcasses at the Nakina River weir, 2006. ..... 122
Appendix D. 1. Salmon catches and effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet) commercial drift gillnet fishery, 1960-2006 ..... 123
Appendix D. 2. Stock proportions and catches of sockeye salmon in the Alaska District 111 commercial drift gillnet fishery, 1983-2006 ..... 125
Appendix D. 3. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet catch by week, 1983-2006. ..... 126
Appendix D. 4. Salmon catch in the U.S. subsistence and personal use fisheries in the Taku River, 1967-2006 ..... 127
Appendix D. 5. Salmon and steelhead trout catch and effort in the Canadian commercial fishery in the Taku River, 1979-2006. ..... 128
Appendix D. 6. Sockeye salmon stock proportions and catch by stock in the Canadian commercial fishery on the Taku River, 1986-2006. ..... 129
Appendix D. 7. Salmon catches in the Canadian Aboriginal fishery on the Taku River, 1980- 2006. ..... 130
Appendix D. 8. Salmon and steelhead trout catch in the Canadian test fishery in the Taku River, 1987-2006. ..... 131
Appendix D. 9. Taku River sockeye salmon run size, 1984-2006. ..... 131
Appendix D. 10. Sockeye salmon escapement estimates of Taku River and Port Snettisham sockeye stocks, 1979-2006. ..... 132
Appendix D. 11. Taku River Chinook salmon run size, 1989-2006. ..... 133
Appendix D. 12. Aerial survey index escapement counts of large (3-ocean and older) Taku River Chinook salmon, 1975-2006. ..... 134
Appendix D. 13. Taku River (above border) coho salmon run size, 1987-2006. ..... 135
Appendix D. 14. Escapement counts of Taku River coho salmon, 1984-2006. ..... 135
Appendix D. 15. Canyon Island fish wheel salmon counts and periods of operation on the Taku River, 1983-2006 ..... 136
Appendix E. 1. Weekly salmon catch and effort in the lower Alsek River fisheries, 2006 ..... 137
Appendix E. 2. Weekly salmon catch and effort in the Canadian Aboriginal and sport fisheries in the Alsek River, 2006. Total catches do not include released fish. ..... 138
Appendix E. 3. Daily counts of salmon passing through Klukshu River weir. ..... 139
Appendix E. 4. Salmon catch and effort in the U.S. Commercial fishery in the Alsek River, 1960 to 2006 ..... 141
Appendix E. 5. Salmon catch in the U.S. subsistence and personal use fisheries in the Alsek River, 1976-2006 ..... 142
Appendix E. 6. Salmon catches in the Canadian Aboriginal and sport fisheries in the Alsek River, 1976 to 2006. ..... 143
Appendix E. 7. Annual Klukshu River weir counts of Chinook, sockeye, and coho salmon, 1976
to 2006. The escapement count equals the weir count minus the aboriginal fishery catch above theweir and brood stock taken.144
Appendix E. 8. Alsek River sockeye salmon escapement 2000 to 2004. Estimates are based on a mark-recapture study which was discontinued in 2005 ..... 145
Appendix E. 9. Alsek River sockeye counts from U.S. and Canadian aerial surveys and from the electronic counter at Village Creek, 1985-2006 ..... 145
Appendix E. 10. Aerial survey index counts of Alsek River Chinook salmon escapements, 1984 to 2006 ..... 146
Appendix E. 11. Alsek River run of large (=>660 mef) Chinook salmon, 1997-2004. Estimates are based on a mark-recapture study and include the percent of chinook salmon. ..... 147
Appendix E. 12. Aerial survey counts of coho salmon from U.S. lower Alsek River tributaries, 1985-2000 ..... 148

Appendix F. 1. Tahltan Lake egg collection, fry plants, and survivals, 1989-2006. Numbers for eggs and fry are millions. ....................................................................................................... 149
Appendix F. 2. Tuya Lake fry plants and survivals, 1991-2006. ............................................. 149
Appendix F. 3. Tatsamenie Lake egg collection, fry plants, and survivals, 1989-2006............. 150

## EXECUTIVE SUMMARY

Estimates of harvests and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek Rivers for 2006 are presented and compared with historical patterns. Average, unless stated differently, refers to the 1996-2005 average. Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Results from transboundary river sockeye salmon Oncorhynchus nerka enhancement projects are also reviewed.

## Stikine River

The 2006 Stikine River sockeye run is estimated at 269,000 fish, of which approximately 177,000 fish were harvested in various fisheries including test fisheries. An estimated 91,000 Stikine River fish escaped to spawn, including 10,000 fish that migrated to the Tuya River block and were not harvested. The run and harvest were above average. The Tahltan Lake sockeye escapement of 54,000 fish was above the upper bound of the goal range ( 18,000 to 30,000 fish). The estimated U.S. commercial catch of Stikine River sockeye salmon in Districts 106 and 108, including the Stikine River subsistence fishery, was 75,000 fish. The Canadian inriver commercial and aboriginal fishery catches were 96,000 and 5,000, fish, respectively. The inriver test fishery harvested 900 sockeye salmon and there was no marine test fishery in 2006. The Stikine Management Model (SMM) predicted a run substantially more than the preseason forecast throughout the course of the fishery. Weekly inseason model projections ranged from 236,000 to 325,000 sockeye salmon; the final inseason model prediction was 298,000 fish, with a total allowable catch (TAC) of 250,000 fish. Based on the postseason run size estimates and TAC calculations of 104,000 Stikine River fish for each country, Canada harvested $97 \%$ and the U.S. harvested $72 \%$ of their respective TACs. Broodstock collection and otolith sampling removed 3,400 and 400 sockeye salmon respectively from the escapement to Tahltan Lake leaving a spawning escapement of 50,000 fish. The estimated spawning escapement of 28,000 mainstem Stikine River sockeye salmon was within the goal range of 20,000 to 40,000 fish for this stock group.

The 2006 Stikine River Chinook O. tshawtsha run is estimated at 67,000 large fish, of which approximately 43,000 fish were harvested in various fisheries. An estimated 24,000 Stikine River fish escaped to spawn, above the 2005 escapement goal of 21,000 large Chinook salmon. The run and harvest were also above the averages. The Little Tahltan River Chinook escapement of 4,000 fish was at the 2005 escapement goal of 4,000 fish and within the upper bound of the goal range (2,700 to 5,300 fish). The estimated U.S. commercial catch of Stikine River Chinook salmon in Districts 106 and 108 gillnet, troll, subsistence, and sport fisheries was 27,000 fish. The Canadian commercial, aboriginal, and sport fisheries catches totaled 16,000 fish. There were no inriver or marine test fisheries for Chinook salmon in 2006. The Stikine Chinook Management Model (SCMM) was persistent throughout the course of the fishery in predicting a total run size larger than the preseason forecast of 61,000 fish. Weekly
inseason run projections from the model ranged from 65,000 to 74,000 Chinook salmon. The weekly mark-recapture estimates ranged from 80,700 to 84,500 fish. The final inseason model prediction was 74,000 fish (both U.S. and Canada), with an AC of 51,600 fish. Managers used both the mark-recapture and model estimates to generate inseason estimates after week 24. Based on the postseason mark-recapture terminal run size estimate of 66,000 and AC calculations of 19,700 Stikine River fish for the Canada and 30,000 large Chinook salmon for the U.S., Canada harvested $80 \%$ and the U.S. harvested $94 \%$ of their respective ACs.

The 2006 run size of Stikine River coho salmon cannot be quantified. The U.S. marine harvest of Stikine River coho salmon $O$. kisutch is also unknown since there is no stock identification program for this species. Mixed stock coho harvest in Districts 106 and 108 were 69,000 and 34,000 fish, respectively. Alaskan hatchery fish comprised approximately $32 \%$ of the coho harvest from the two districts. The Canadian inriver coho catch of 100 fish was below average. The aerial survey count of 2,000 fish from six index sites combined was below average.

## Taku River

The postseason estimate of the 2006 Taku River sockeye run is 233,000 fish, including an estimated catch of 87,000 fish and an above-border spawning escapement of 146,000 sockeye salmon. The run size was below average while the escapement was above average and above the goal range of 71,000 to 80,000 fish. An estimated 65,000 Taku River sockeye salmon were harvested in the District 111 commercial fishery, below the average of 110,000 fish, and an estimated 800 sockeye salmon were harvested in the U.S. inriver personal use fishery. Canadian inriver commercial and aboriginal fishery harvests included 21,000 and 100 sockeye salmon, respectively, and were below average. The U.S. harvested an estimated $42 \%$ of the TAC and Canada harvested an estimated $13 \%$ of the TAC.

The harvest of large Chinook salmon in the Canadian commercial fishery in the Taku River was 7,400 fish, above average and the second year with a directed Chinook fishery. The Canadian aboriginal fishery in the Taku River harvested 200 large Chinook salmon. District 111 mixed stock drift gillnet fishery harvest of 11,000 Chinook salmon was above average and also the second year of a directed Chinook fishery. Approximately 5\% of the harvest was estimated to be of Alaska hatchery origin. The above border spawning escapement estimated from the mark-recapture program is 42,000 fish.

The estimated above border run of Taku River coho salmon in 2006 is 134,000 fish, which is above average. The Canadian inriver commercial harvest included 9,000 coho salmon, twice the average. After upriver Canadian harvest and test fishery catches are subtracted from the inriver run, the above-border spawning escapement is estimated at 122,000 coho salmon, which exceeds the minimum escapement goal of 38,000 fish. The U.S. harvest of 60,000 coho salmon in the District 111 mixed stock fishery was more than twice the average. Alaskan hatcheries contributed an estimated 3\% of the District 111 harvest, or 2,000 fish.

The harvest of 185,000 pink salmon O. gorbuscha in District 111 was nearly twice the average. A total of 400 pink salmon were retained in the Canadian commercial inriver fishery in 2006. The Taku River pink escapementwas likely above average as evidenced by the fish wheel catch and release of 22,000 fish which is $60 \%$ above average.

The catch of chum salmon O. keta in the District 111 fishery was 382,000 fish; composed of 374,000 summer run fish (prior to mid-August) and 8,000 fall run fish. The summer chum harvest, primarily Alaskan hatchery stocks, was the third highest on record. The fall chum harvest, composed of wild Taku River and Port Snettisham stocks, was above average. There was non-retention of chum salmon in the Canadian inriver fishery and the reported catch was 0 fish in 2006. Although spawning escapement is not known the Canyon Island fish wheel catch of 466 chum salmon was above average.

#### Abstract

Alsek River The Alsek River sockeye harvest of 10,000 fish in the U.S. commercial fishery was below average. The Canadian inriver harvest of 1,300 sockeye salmon was average. The Klukshu River weir count of 13,500 sockeye salmon was average and within the goal range of 7,500 to 15,000 fish. The count of 250 early run sockeye salmon (count through August 15) was the third lowest on record, however the overall migration was late and some of the early run may have been ascribed to the late run. The late run count of 13,000 fish was above average.

The Chinook run to the Alsek River appeared to be below average. The U.S. Dry Bay catch of 500 large Chinook salmon was below average. The combined Canadian sport and aboriginal fishery catch of 17 Chinook salmon was below the average of 500 fish and the lowest on record. The 570 Chinook salmon counted through the Klukshu River weir was the lowest on record and the spawning escapement was below the goal range of 1,100 to 2,300 Chinook salmon.

Current stock assessment programs prevent an accurate comparison of the Alsek River coho run with historical runs. The U.S. Dry Bay catch of 700 coho salmon was below average, no catches were recorded for the Canadian inriver aboriginal and recreational fishery. The operation of the Klukshu weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is over; however, it does provide an annual index. The count of 400 coho salmon was below the average.

## Enhancement

Eggs and milt were collected from the year 2006 sockeye escapements at Tahltan and Tatsamenie Lakes. A total of 4.4 million eggs were collected at Tahltan Lake. At Tatsamenie Lake, 4.8 million eggs were collected for the hatchery.

Outplants of 2005 brood year sockeye fry in May and June 2006 included, 1.3 million fry into Tahltan Lake, 2.1 million fry into Tuya Lake, and 1.5 million fry into Tatsamenie

Lake. Green-egg to planted-fry survivals were $71 \%$, $78 \%$, and $81 \%$ for the Tahltan, Tuya and Tatsamenie outplants, respectively. Survival to emergence was about average.

The egg incubation and thermal marking program was continued at Snettisham Hatchery in 2006. Snettisham hatchery is operated by DIPAC (Douglas Island Pink and Chum, Inc.), a private aquaculture organization in Juneau. A co-operative agreement between ADF\&G and DIPAC provides for Snettisham hatchery to serve the needs of the joint TBR enhancement projects.

Adult sockeye otoliths were processed inseason by the ADF\&G otolith lab to estimate the weekly contribution of fish from US/Canada fry-planting programs to the District 106, 108, and 111 drift gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku Rivers. Contribution estimates of planted fish to Alaskan harvest were 31,000 Tahltan and 10,000 Tuya fish to District 106 and 108 combined, and 2,200 Tatsamenie fish to District 111. Estimates of contributions to Canadian fisheries included 42,000 Tahltan and 18,000 Tuya fish to Stikine River fisheries and 800 fish to the Taku River fisheries.

## INTRODUCTION

This report presents estimates of the 2006 catch and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek Rivers and discusses management actions taken during the season. Catch and effort data are presented by management week (U.S. statistical week), hereafter referred to as week, for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku Rivers are also summarized.

The Transboundary Technical Committee (TTC) met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: Pacific Salmon Commission TTC, 2006 Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers TCTR (07)-1, April 2007.

Run reconstruction analyses are conducted on the sockeye and Chinook runs to the Stikine and Taku Rivers and for coho runs to the Taku River for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine catch are made for Alaskan fisheries outside of District 106 and 108 for Stikine River sockeye stocks, District 111 for Taku River sockeye stocks and Sub-district 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial drift gillnet fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet fisheries located in the lower and upper Stikine River, and by a Canadian aboriginal fishery in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A small sport fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a United States personal use fishery was established in the lower Stikine River; no catches were reported in this fishery in 1995 through 2000, approximately 30 sockeye salmon were harvested in 2001, and the personal use fishery on the Stikine River was not open in 2002 and 2003. A subsistence fishery was opened in 2004. Additional catches of unknown quantity are taken in U.S. troll and seine fisheries and in sport fisheries near Wrangell and Petersburg. In 1996, the spring experimental troll area in the District 110 portion of Frederick Sound was expanded to target hatchery Chinook salmon; four previous areas were combined into one large area that also included previously unopened waters. This area was the same in 2003. In 1993 the spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Negotiations between Canada and the United States to replace expired portions of Annex IV, Chapter 1 of the PST resulted in the following arrangements for Stikine River salmon which are expected to be in place through 2008. Highlights of the most recent round of the PSC negotiations held in Portland, Oregon in February 2005 included: an agreement for new directed fisheries on Stikine River Chinook stocks; an agreement on a US subsistence fishery on Chinook and coho stocks within the US section of the Stikine River; and, an agreement to ensure the US deliver 1,000 additional coho salmon to the Canadian fishery. Details of the February 2005 agreement including harvest share provisions have been incorporated into the Transboundary Annex (Annex IV) of the PST and can be found at: http://www.psc.org/pubs/treaty.pdf.

As in most previous years, the TTC met prior to the season to update joint management and enhancement plans, develop run forecasts and determine new parameters for input into the inseason Chinook and sockeye run projection models. The nascent SCMM served as the principal management tool governing weekly fishing regimes for the new directed Stikine River Chinook fisheries. The SMM was used in management of the sockeye fisheries. Both models were complemented inseason with concurrent Chinook and sockeye mark-capture studies.

## Chinook Salmon

The SCMM model is based on the linear regression (correlation) between weekly cumulative catch per unit effort (CPUE) of large Chinook salmon observed at the tagging site and total run size based on mark-recapture studies conducted in 1996-2005. Most of the CPUE and run size data sets are significantly correlated. Inseason model estimates were available commencing week 20 (May 14-20). Mark-recapture estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were also generated commencing in week 20. In order to honor Annex IV, Chapter1, Paragraph 3(a)(3)(vii), which obliges the Parties to apportion their overall TAC by historical weekly run timing, weekly fishery openings were announced based on weekly guideline harvests. The Canadian guideline harvests were derived from historical run timing data from the 2005 inriver commercial fishery and the 2000-2003 inriver test fisheries. The U.S. guidelines were derived from historical run timing in District 108 (1969-1973 and 2005) and historical CPUE from the Kakwan Point tagging site, delayed one week (1996-2004) and the 2001-2003 average CPUE form the Canadian Chinook test fishery delayed one week.

The preseason Chinook forecast was used during weeks 18 through week 20. After week 20, inseason forecasts of total run size and AC were used to assist in determining weekly fishing plans (Table 1). After week 20, mark-capture estimates were generated to complement the SCMM estimate; the average run size generated from the mark-recapture estimates and the SCMM were used to project inseason run size in some weeks. The weekly inputs to the model included: the catch and effort data from Kakwan Point, the District 108 sport, troll, and drift gillnet catch. The Canadian sport and gillnet catches
were also added to the model. Weekly guideline quotas were established in District 108 and Canada based on the historical run timing curves mentioned above.

Table 1. Stikine River large Chinook run size based on a model (SCMM) and mark-recapture estimates, weekly AC, and weekly catch estimates from the District 108 drift gillnet, sport, and troll fisheries and the Canadian gillnet and sport fisheries, 2006.

The preseason forecast for the terminal Stikine River Chinook run was approximately 60,600 large fish (Table 1), which indicated a run size characterized as well above average. Joint Canadian and U.S. inseason predictions of terminal run size ranged from 61,000 to 75,000 Chinook salmon (Table 1). Managers used the daily catch and effort data transmitted from the Kakwan Point tagging site to make daily run projections. Joint weekly run size estimates were calculated late in the current week (Thursday or Friday) and were used to set the following week's fishery openings. Managers used both the weekly mark-recapture and SCMM estimates after week 24 (June 11-17) to make weekly management plans. (note: In general, both U.S. and Canadian managers sensed that the SCMM underestimated the run after week 24, while the mark-recapture estimates overestimated the run size after week 24 . From week 25 through week 29 the average of the two estimates was adopted.) All projections generated by the joint SCMM and the mark-recapture study indicated an above average run. Based on mark-recapture data collected from the inriver commercial fishery and stratified by weeks, the final postseason terminal run size estimate for Stikine Chinook salmon was 66,952 large

Chinook salmon, close to the final inseason estimate of ~74,000 large fish, and above the preseason forecast of 60,600 large Chinook salmon (Table 1). The 2006 Little Tahltan escapement of 3,860 large Chinook salmon represents approximate $16 \%$ of the total inriver escapement of 24,399 fish, compared to an average of $20 \%$ of the total inriver escapement.

## Sockeye Salmon

The SMM was upgraded to provide inseason projections of the total Stikine River sockeye run as well as the following components of the run: the Tahltan stock (wild and planted combined); the planted Tuya stock; and the mainstem stocks. The model for 2006 was based on CPUE data from 1985 to 2005 from the Alaska District 106 fishery and the Canadian commercial fishery in the lower river and from 1986 to 2004 from the lower Stikine River test fishery. Linear regression was used to predict run size from cumulative CPUE for each week of the fisheries beginning in week 25 for District 106 and week 26 for the inriver fisheries. As in 1999-2005, the intercept was forced to be zero in order to correct for a tendency to overestimate the run size in the early weeks during years of low abundance. Each CPUE and run size data set is significantly correlated.

Initially in 2006 the inriver test fishery CPUE data was slated to be the primary data from which inseason projections of sockeye run size would be generated; however, the CPUE from the commercial fishery was used instead due to the extended fishery openings which resulted in limited or absent test fishing activity. Calculations for the lower Stikine River commercial CPUE excluded catch and effort data from the Flood Glacier area, i.e., the new area introduced in 1997 and fished through the 2000 season and again opened in 2004-2006. In addition, the annual weekly CPUE values were adjusted in order to make the current year data comparable with historical CPUE. For example, during 1979-1994 and 2000-2004, only one net per license was permitted, while in 1996-1999 and 20052006 two nets per license were allowed. It is estimated that the second net increased the catch and CPUE by approximately $25 \%$.

In 2006, the preseason forecasts were used for fishery management during weeks 24 through 27. After week 27, inseason forecasts of total run size and TAC, produced by the SMM and based on CPUE data in the lower river commercial fishery, were used to assist in determining weekly fishing plans (Table 2). The weekly inputs to the model included: the catch, effort and stock composition (proportion Tahltan/Tuya from egg diameters, proportion planted Tuya from thermal mark analyses of otoliths) in the Canadian lower river test (when in operation) and commercial fisheries; the upper river catch in the aboriginal fishery (AF) and upper river commercial fishery; the catch, effort and assumed stock composition in Subdistrict 106-41 (Sumner Strait); and, the catch and assumed stock composition in District 108 and Subdistrict 106-30 (Clarence Strait). Preliminary results of thermal mark analyses were available inseason for the marine and lower river fisheries to account for Tuya production in the model and reduce the risk of overestimating the TAC of Tahltan sockeye salmon.

Table 2. Weekly forecasts of run size and total allowable catch for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model, 2006.

${ }^{\text {a }}$ does not include test fishery catches
Initially, average stock proportions in District 106 and 108 catches, from historical postseason scale pattern analysis (SPA), were assumed for weekly catches; the averages used each week depended upon whether the run was judged to be below average, average, or above average. The planted Tahltan and Tuya stock proportions were subsequently adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108. The weekly estimate of Tuya fish in District 106-41 and 108 was added to the historical proportion of Tahltan fish in the SMM since this stock was not present in the historical database.

The preseason forecast for the Stikine River sockeye run was approximately 179,179 fish (Table 2), which indicated aa average size run. The forecast included approximately 74,400 natural Tahltan sockeye salmon, 50,600 planted Tahltan fish, 2,170 planted Tuya sockeye salmon, and 51,957 mainstem fish. Canadian inseason predictions of total run ranged from 247,000 to 339,200 sockeye salmon; U.S. forecasts ranged from 235,000 to 325,000 (Table 2). All inseason forecasts indicated an above average run. Differences in U.S. and Canadian weekly predictions are due only to different catch data inputs being used for the updates. Unlike pervious years, the postseason estimates of run size and TAC are, in general, lower than those used inseason for management (Table 2, 3).

## U.S. Fisheries

The 2006 drift gillnet harvest in District 106 included 1,737 large Chinook, 211 jack Chinook, 91,980 sockeye, 69,015 coho, 149,907 pink, and 268,436 chum salmon

${ }^{\text {a }}$ Escapement into terminal and spawning areas from traditional fisheries.
${ }^{\text {b }}$ Catch allowed in terminal areas under the Excess Salmon to Spawning Requirement license.
${ }^{\text {c }}$ Fish returning to the Tuya system are not able to access the lake where they originated due to velocity barriers.
${ }^{\mathrm{d}}$ The number of Tuya fish that should be pass through traditional fisheries in order to harvest the Tuya stock at the same rate as the Tahltan stock to ensure adequate spawning escapement for Tahltan fish.
${ }^{\text {e }}$ Includes traditional, ESSR, and test fishery catches.
${ }^{f}$ Does not include ESSR or test fishery catches.
${ }^{g}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than in the listed fisheries.
(Appendix A.1). Chinook and chum harvests were above average, while the other salmon harvests were below average. Stikine River sockeye salmon contributed an estimated 25,190 fish, $27 \%$ of the harvest, to the District 106 drift gillnet fishery (Appendix A.2). An estimated 878 Chinook salmon in the District 106 harvest (51\%) were of Alaska hatchery origin (Appendix A.1). An estimated 22,265 coho salmon in the District 106 harvest were of Alaska hatchery origin, 32\% of the total coho harvest. The District 106
drift gillnet fishery was open for 45 days from June 11 through October 3 (Appendix A.1). This was slightly below the average fishing time of 47 days. Weekly fishing effort in number of vessels fishing in District 106 was below average for every week of season with the exception of week 26 . The greatest effort in vessels fishing, 88 boats, occurred in week 29. However, the greatest effort in boat days (272) occurred in week 37 (Appendix A.1). The total season effort was 2,036 boat days (Appendix A.1).

The Sumner Strait fishery (Subdistricts 106-41 \& 42) harvested an estimated 23,215 Stikine River sockeye salmon (Appendices A.3., A.4), $40 \%$ of the total sockeye harvest in that subdistrict. The Clarence Strait fishery (Subdistrict 106-30) harvested an estimated 1,974 Stikine River sockeye salmon (Appendices A.5, A.6), 6\% of the total sockeye harvest in that subdistrict.

In District 108, 27,062 large and 3,024 jack Chinook, 61,298 sockeye, 34,430 coho, 56,810 pink, and 343,637 chum salmon were harvested during the fishing season (Appendix A.7). Harvests were above average for all species and the Chinook and chum harvests were the highest on record in District 108. The District 108 fishery harvested an estimated 49,237 Stikine River sockeye salmon (Appendix A.8), 80\% of the District 108 sockeye harvest. The District 108 fishery started on May $1^{\text {st }}$ and included six weeks of directed Chinook fishing before the usual sockeye opening occurred in week 24 (June 11). District 108 closed concurrently with District 106 on October $3^{\text {rd }}$. The 64 days the district was open is second only to the 2005 season (and tied with the 1972 season) for the most days open on record (Appendix A.7). Excluding the directed Chinook fishery, the district was open for 52 days, which is above average (this average only includes the usual sockeye fishery in the 2005 season). District 108 was open for at least three days a week with the exception of weeks 32 through 36 and week 40 when two-day openings occurred. The weekly fishing effort, number of vessels fishing, in District 108 during the usual fishery (weeks 24 through 40) was above average every week with the exception of weeks 26,34 , and 40 . The season effort of 2,341 boat-days, during the usual fishery, in District 108 was above the average of 1,454 boat-days.

The District 108 test fishery did not take place in 2006 (Appendix A.9).
The 2006 season was the third season a U.S. Federal subsistence sockeye fishery was conducted on the Stikine River, and was the second season that a U.S. Federal subsistence Chinook and coho fishery were conducted (Appendix A.11). The fisheries were managed by the United States Forest Service. A permit issued by the USFS to federally qualified users was required. The fisheries took place on the Stikine River upriver from marine waters to the U.S./Canadian border. Fishing in "clearwater" tributaries or side channels and at stock assessment sites was prohibited. The Guideline Harvest Levels for Chinook, sockeye, and coho salmon were set at 125, 600, and 400 fish, respectively. The open dates were May 15 to June 20 for the Chinook fishery, June 21 to July 31 for the sockeye fishery, and August 15 to October 1 for the coho fishery. The allowable gear for the fishery included dipnets, spears, gaffs, rod and reel, beach seine, and gillnets not exceeding 15 fathoms in length with mesh size no larger than $51 / 2$ inches except during the Chinook fishery when mesh up to 8 inches was allowed. A total of 48 permits were issued of which 22 were fished; the estimated harvests included 37 Chinook, 390 sockeye, and 21 coho salmon.

The second consecutive commercial directed Stikine River Chinook fishery in recent years occurred during weeks 18 through 23 of the 2006 season (Appendix A. 10.). The preseason forecast was moderate in comparison to the 2005 season with the total runs projected to be approximately 61,000 large Chinook salmon for 2006. The U.S. AC based on this forecast was approximately 15,000 fish. The fishery was limited to the waters in District 108 in order to target returning Stikine Chinook salmon. One hundred eighteen gillnetters landed Chinook salmon over the course of this six-week fishery. A total of 12 days were fished within this time period. The drift gillnet fleet harvested the bulk of the large Stikine Chinook salmon in District 108 with an estimated 21,892 fish caught through week 29. The sport fishery was open continuously from week 18 through 29 with liberalized bag and gear limits. The sport fishery harvested an estimated 2,944 large Stikine Chinook salmon during this time period. The troll fishery had five-day openings each week throughout most of District 108 from week 18 through 26 with the exception of week 22 which had a four-day opening due to potential conflicts with Memorial Day sport fishermen. The spring troll fishery was closed by regulation on June 30. The troll fishery accounted for 1,898 Stikine Chinook salmon in District 108. The final cumulative U.S. harvest of large Stikine Chinook salmon through week 29, including the federal Stikine subsistence fishery, was 26,771 fish. The final estimate of the total terminal run was 66,952 large Chinook salmon and was based upon mark-recapture information. Based upon that final postseason estimate of the run size, the U.S. allowable catch was 30,000 large Stikine Chinook salmon.

The District 108 directed Stikine Chinook gillnet fishery began at 8:00 am on Monday, May 1 (week 18) for a two-day period. This relatively short opening was influenced by a moderate preseason forecast combined with expected high effort. These same factors also led to the closure of the Stikine River flats in District 108. Small area closures also occurred that were established by the Alaska Board of Fish, although these closures were not nearly as numerous as those initiated in the 2005 season. The closures were once again intended to reduce conflicts between commercial and sport fishers and for steelhead conservation. Several of the 2006 season area closures were dependent on the weekly openings of the gillnet fishery; the two-day openings that occurred each week of the directed Chinook fishery resulted in few area closures. The most important steelhead conservation tool that was put into place in 2006 was a minimum gillnet mesh size of seven inches during the directed Chinook fishery. Thirty four gillnetters made landings in District 108 during the initial opening. The majority of boats fished in Section 8-B, and this trend continued throughout the directed Chinook fishery. A unique dynamic of the fishery was the proximity to town, and few fishermen spent entire openings without returning to port. The preseason forecast was used for the first three weeks of the fishery and the first inseason run estimate was released in week 20. The estimated District 108 gillnet harvest for week 18 was just over 300 large Chinook salmon. This estimated catch was right in line with a weekly allowable catch of approximately 350 large Chinook salmon based on historical run timing and the preseason forecast.

During weeks 19 (May 7 - May 13) and 20 (May 14 - May 20), District 108 was opened with the same area and time as week 18. Gillnet effort increased steadily as the season progressed with 52 boats making landings in week 19 and 85 boats in week 20. The effort
in week 20 was a substantial increase compared to the effort in the 2005 season during the same opening. The cumulative harvest of large Stikine Chinook salmon by the U.S. fisheries was estimated to be approximately 3,400 fish by the end of week 20. Although weekly allowable catches had been exceeded during these openings, the run appeared strong based on both the commercial marine catches and the inriver mark-recapture catches. The first inseason forecast, near the end of week 20, increased the projected terminal run size to 69,272 fish. This resulted in an increase in the U.S. AC to 25,000 large Stikine Chinook salmon, approximately 10,000 fish more than the preseason forecast AC.

During weeks 21 (May 21 - May 27) and 22 (May 28 - June 3), fishing time was again kept at two days, but the Stikine River flats were opened. The management tools for week 21 were reduced as a two-day fishery before the Memorial Day weekend had been agreed on by the Stikine King Salmon Workgroup. Therefore, the opening of the flats was the only way to take advantage of the increased inseason forecast. Gillnet effort was highest during the fishery in week 21 with 110 boats participating while 106 boats made landings in week 22. The terminal run forecast jumped again in week 21 to 74,000 fish which brought the U.S. AC to nearly 28,000 fish. The high effort observed during week 21 influenced the decision to keep the week 22 opening at two days, even though the forecast had increased. Harvest of large Chinook salmon increased each of these weeks with an estimated 3,000 gillnet fish harvested in week 21 and 4,000 gillnet fish harvested in week 22. The estimated cumulative harvest by all U.S. fisheries was approximately 12,000 large Stikine Chinook salmon by the end of week 22. The terminal run forecast dropped to 65,782 fish in week 22. The corresponding U.S. AC at this point was approximately 22,500 fish. Signs of a strong Stikine run remained evident in the gillnet fishery as weekly catch rates remained nearly identical to the 2005 season.

During week 23, District 108 was again opened for two days. Although the run appeared strong, due to substantial effort combined with a decreased forecast, the fishery was not extended. In addition, catch rates inriver were low due to high river levels. One hundred gillnetters made landings during this opening. The catch rates remained strong and were higher than those calculated during the same week in the 2005 season. The estimated gillnet harvest for week 23 was 4,700 large Chinook salmon. The estimated harvest from week 23 brought the cumulative harvest by all U.S. fisheries up to an estimated 17,500 large Stikine Chinook salmon. The inseason forecast dropped slightly from the previous week to 64,000 fish, which resulted in a U.S. AC of nearly 21,500 large Stikine Chinook salmon. Week 23 was the last week of the directed Stikine Chinook fishery.

During weeks 24 and 25, the majority of gillnetters that fished in District 108 retained Chinook gear. Eighty seven boats made landings in week 24 and 65 boats made landings in week 25. Week 24, with a three-day opening, had the largest weekly harvest of Chinook salmon in District 108 for the season. Comparison of marine catches this year to the 2005 season indicated that the Stikine Chinook run was at least one, and possibly two weeks late. The hatchery component each of these weeks was large in the gillnet fishery; boats fishing farther from the river had higher catch rates than boats fishing near the mouth of the river. In week 24, the forecast increased to a terminal run of 70,000 fish and
then dropped back down to 61,000 fish in week 25 with a U.S. AC of approximately 19,400 large Stikine Chinook salmon.

During week 26, closure lines were pushed farther out off the mouth of the Stikine River due to the reduced Stikine Chinook forecast in week 25 and concerns around the Chinook harvest sharing agreement. The forecast during week 26 increased to 73,000 large Stikine Chinook salmon which was nearly the highest forecast of the season. An estimated 10,100 large Stikine Chinook salmon were harvested during the directed sockeye fishery from weeks 24 through 29.

The District 106 gillnet season began, and the District 108 season continued into sockeye management, at 12:00 noon on Sunday, June 11, week 24, for a three-day period. In District 108, the Stikine River flats were left open due to the anticipated reduction in effort. The first sockeye opening is normally two days and any decision to extend fishing is based on fishery harvest rates estimated by management biologists on site in the fishery. However, an initial three day opening was set because of the above average forecast of Tahltan sockeye salmon. The sockeye catch rates in District 108 were poor, but this was most likely due to the majority of the effort in the district being directed at Chinook salmon. The sockeye catch rates in District 106 were good for the seven boats that made landings there. There was no effort in Clarence Strait (106-30) for this initial sockeye opening. District 108 effort was high with 87 boats making landings; again, most boats were targeting Chinook salmon (Appendices A. 3 and A.5). The inseason otolith readings for sub-district $106-41$ indicated that $3.1 \%$ of the catch was comprised of thermally marked Tahltan fish while no Tuya fish were indicated. The District 108 reading indicated $19.7 \%$ thermally marked Tahltan fish and $4.7 \%$ thermally marked Tuya fish. The preseason SMM forecasted a total Stikine River TAC of 122,940 sockeye salmon and a Tahltan TAC of 99,796 fish (Table 2). This would allow the U.S. fisheries to harvest a total of 61,470 Stikine River fish, including 49,898 Tahltan fish. The preseason forecast was used for weeks 24-27, while the inriver commercial fishery CPUE was used for the remainder of the sockeye season.

During week 25, there were 25 boats fishing in Sumner Strait, 2 boats fishing in Clarence Strait and 65 boats fishing in District 108 for the three-day opening (Appendices A. 3 and A.5). The sockeye CPUE in District 106 was above average for this week. The District 108 sockeye CPUE, however, was below average. Again, this was because the majority of the fleet was targeting Chinook salmon. The few boats that were actually targeting sockeye salmon in District 108 had high catch rates during the weekly survey. The inseason otolith readings for sub-district 106-41 indicated that $18.1 \%$ of the catch was comprised of thermally marked Tahltan fish while $3.8 \%$ were thermally marked Tuya fish. In District 108, 32.7\% were thermally marked Tahltan fish and 7.9\% were thermally marked Tuya fish.

During week 26, there were 61 boats fishing in Sumner Strait, 14 boats fishing in Clarence Strait and 49 boats fishing in District 108 (Appendices A. 3 and A.5). A much larger closure in District 108 was put in place off the mouth of the Stikine River due to Chinook harvest sharing concerns. Many gillnetters switched to sockeye gear during this
opening. The District 106 and 108 sockeye harvest and CPUE were below average. No extra time was warranted this week and the fishery closed after three days. The inseason otolith readings for sub-district 106-41 for week 26 indicated that $24.7 \%$ of the catch was comprised of thermally marked Tahltan fish while $9.1 \%$ were thermally marked Tuya fish. The District 108 reading indicated 38.2\% thermally marked Tahltan fish and 12.9\% thermally marked Tuya fish. The estimated U.S. total Tahltan sockeye harvest by the end of this week was 9,017 fish.

During week 27, District 106 and 108 were initially opened for two days (Appendix A.7). There were 20 boats fishing in Clarence Strait and 37 boats in Sumner Strait, and a total of 78 boats fishing in District 108 for the week (Appendices A.3, A.5, and A.7). Surveys on the fishing grounds showed that the CPUE for the two-day opening was above average in both districts. Due to the solid catch rates in both districts, possibly reflecting a strong Tahltan run, and the low effort in District 106, a one-day extension occurred in both districts. High catch rates continued during the extension in both districts and a 24 -hour midweek opening was announced for District 108. This resulted in a total of four days of fishing in District 108 for the week. The catches in the inriver Canadian commercial fishery were also high this week. The percentage of thermally marked Tahltan sockeye salmon in sub-district $106-41$ remained high at $24.6 \%$ while the marked Tuya fish contributed 15.5\%. In District 108, marked Tahltan fish contributed $36.3 \%$ while marked Tuya fish contributed 13.5\%. On average, the peak Tahltan abundance occurs in District 106 in week 27 and this year did not seem to be an exception. The estimated cumulative U.S. harvest of Tahltan sockeye salmon in District 108 was 15,839 fish while 12,971 fish were estimated in District 106 making a total estimated U.S. Tahltan sockeye harvest of 28,810 fish through week 27.

During week 28, 75 boats fished in District 106 and 88 boats fished in District 108 (Appendices A. 1 and A.7). Indices of inriver run strength of Tahltan sockeye salmon continued high with high catch rates in the lower river commercial fishery in Canada. Both districts were open for an initial three days of fishing time. Fishing ground surveys indicated that sockeye CPUE for the three-day opening was generally below average in District 106 and above average in District 108. The effort in District 108 this week was above average and a number of boats in the district were starting to target Anita Bay chum salmon. The continued solid catch rates of sockeye salmon in District 108, even when some boats were targeting chum salmon, signified a strong sockeye run. A 48-hour midweek opening occurred in District 108. The inseason otolith readings for week 28 indicated that the marked Tahltan fish contributed $16.0 \%$ of the District 106 catch and $39.7 \%$ of the District 108 catch. The marked Tuya fish contributed $5.9 \%$ and $12.3 \%$ in District 106 and 108 respectively. The first inseason forecast from the SMM indicated a stronger run than the preseason forecast. The SMM run prediction increased the Tahltan component to 177,900 fish, with a TAC of 152,644 fish. The Tuya component increased from a total preseason forecast of 2,170 fish to 23,588 fish. The mainstem component dropped from a preseason forecast of 51,957 fish to 45,488 fish. The estimated U.S. Tahltan harvest by the end of this week was 42,773 sockeye salmon with a U.S. TAC of 76,322 fish. The estimated U.S. harvest of mainstem sockeye salmon was 8,893 fish with a U.S. TAC of 7,483 fish. It was generally believed that once again the SMM was under
forecasting the mainstem run size, as was the case the last couple of years, due to the Tahltan sockeye run being stronger than average.

During week 29, there were 88 boats fishing in District 106 and 99 boats fishing in District 108 (Appendices A. 1 and A.7). Both districts were open for an initial three days. The sockeye CPUE in District 106 was slightly above average. The sockeye catch rates in District 108 were below average due to a shift in effort to the southern parts of the district to target hatchery chum salmon. The catch rates of gillnetters who were targeting sockeye salmon in District 108 appeared above average on the weekly survey. Due to the significant jump in the forecasted run size, and the lack of boats targeting sockeye salmon, a 48-hour midweek opening was announced in District 108. The U.S. catch of Tahltan sockeye salmon through week 29 was estimated at 48,647 fish with a U.S. TAC of 107,881 fish. The inseason otolith readings for week 29 indicated that marked Tahltan fish contributed to $15.4 \%$ of the District 106 catch and $25.0 \%$ of the District 108 catch. The SMM estimated a total U.S. mainstem catch of 12,382 sockeye salmon with a remaining U.S. TAC of 0 fish. The mainstem run size estimate dropped to 19,916 sockeye salmon even though catch rates in the lower river commercial fishery remained high. The proportion of Tahltan fish to mainstem fish in the inriver commercial fishery remained high and signified a sustained Tahltan sockeye run.

During week 30, there were 56 boats fishing in District 106 and 101 boats fishing in District 108. Both districts were open for an initial two days. The reduced opening was due to concern for McDonald Lake sockeye catches in District 106. Sockeye catch rates in both districts were below average. However, the catch rates for those few boats that were targeting sockeye salmon in District 108 were above average. Although the mainstem run did not appear strong, it was apparent that the model was overestimating the U.S. mainstem catch. Due to the small exploitation rate of sockeye salmon in District 108, a 24 -hour midweek opening was announced in District 108. The U.S. catch of Tahltan sockeye salmon was estimated at 49,788 fish with a U.S. TAC of 117,362 fish. The SMM estimated a total U.S. mainstem catch of 14,655 fish with a U.S. remaining TAC of 0 fish. The mainstem run size estimate increased slightly this week to 20,054 sockeye salmon. The marked Tahltan component in District 108 remained relatively high at $14.6 \%$ of the catch according to the inseason otolith readings.

During week 31, there were 39 boats fishing in District 106 and 82 boats fishing in District 108. Both districts were opened for an initial two days. Again, the reduced opening was due to concerns for McDonald Lake sockeye salmon. Sockeye catch rates in both districts were below average, but similar to the previous week, the sockeye catch rates in District 108 were not a true reflection of run strength due to the shift in effort to target chum salmon. Again, the small number of boats targeting sockeye salmon in District 108 had above average catch rates. Inriver indicators suggested that the egg ratio in the commercial catch was $80 \%$ Tahltan fish. The mainstem component was beginning to slowly increase, and it was suggested that the U.S. harvest of mainstem sockeye salmon was more likely in the neighborhood of 5,000 fish rather than the 14,000 fish the SMM estimated the week before. Once again, a 24 -hour midweek opening was announced in District 108. The SMM estimated a U.S. harvest of 50,278 Tahltan sockeye
salmon with a U.S. TAC of 104,549 fish (Table 2). The mainstem harvest by the U.S. was estimated to be 15,573 sockeye salmon with a remaining U.S. TAC of 0 fish. The strength of the Tuya run was a surprise and the model estimated a run size of 34,089 fish with a U.S. harvest of 11,219 fish through week 31 . The inseason otolith readings for week 31 indicated that marked Tahltan fish contributed to $16.3 \%$ of the District 108 catch. This is a large proportion of Tahltan fish for this time of year. The final SMM run estimated a total U.S. catch of 78,839 Stikine sockeye salmon with 50,688 Tahltan fish, 11,244 Tuya fish, and 16,907 mainstem fish estimated. The final mainstem run size was estimated at 57,533 fish, which still left the U.S. slightly over the TAC of 13,505 fish. The total Stikine sockeye run estimate based on the SMM was 320,755 fish.

During weeks 32 through 35, both Districts 106 and 108 were managed for pink salmon. Both districts were open two days a week during this period. Section D of District 106 was closed from week 32 through week 35 . Gillnet openings during this time period were limited due to the low run strength of pink salmon. Pink harvests in both districts are not always a true reflection of abundance because low prices for pink salmon and catches of other more valuable species may affect the fishing patterns and methods. During the 2006 season, the fishing effort was less than average in District 106; however, in District 108 the effort was generally above average for this time period. The hatchery chum run passing through District 108 was the catalyst behind the increased effort in the district at this time. Total pink harvest was below average in District 106 and above average in District 108.

Coho management typically commences in late August or early September in both the District 106 and 108 gillnet fisheries. During week 36, the management emphasis changed from pink to coho salmon. Prior to the change to coho management the District 106 fishery harvested 30,620 coho salmon, approximately 44\% of the total District 106 coho catch. The Alaska coho hatchery contribution to the District 106 fishery was below average every week of the season with the exception of weeks 34 through 37. Coho catch rates during weeks 36 and 37 were above average in both districts, while the following two weeks (weeks 38 and 39) had below average catch rates. The last week of the fishery (week 40) had above average coho catch rates in District 108 but below average catch rates in District 106. Both districts started with a two-day opening in week 36, followed by two four-day openings in weeks 37 and 38, and then tapering down to three days in week 39, and finally two days in week 40 . The weekly coho harvest in District 108 was generally above average for the fall coho season, but effort was above average as well so this was not wholly indicative of run strength.

## Canadian Fisheries

The combined Canadian commercial and aboriginal gillnet fisheries, and sport fishery in the Stikine River in 2006 included: 15,782 large Chinook, 2,078 jack Chinook, 101,405 sockeye, 72 coho salmon, 4 pink, and 14 chum salmon (Appendices A. 12 - A.16). There was no harvest in the terminal fishery located at the mouth of the Tuya River (Figure 1). Because of the new targeted Chinook commercial fishery, the catches of large Chinook salmon were well above average and the second highest on record. Catches of jack

Chinook salmon were twice the average, while the relatively minor catches of pink, chum and coho salmon were below average. The sockeye catch was a record. The estimate of the total contribution of sockeye salmon from the Canada/U.S. fry-planting program to the combined Canadian aboriginal and commercial fisheries is 59,869 fish, $59 \%$ of the catch (Table 3).

Two test fisheries (sockeye and coho salmon) were conducted for stock assessment purposes in the lower Stikine River in 2006. The test fisheries were located immediately upstream from the Canada/U.S. border. Combined test fishery catches totaled: 928 sockeye, 524 coho, 111 pink, 48 chum salmon, and 93 steelhead trout (all steelhead trout and most of the coho salmon were released) (Appendices A.17, A.18). One objective of the sockeye test fishery was to obtain data for the mark-recapture study. Additional objectives of the sockeye test fishery were similar to those in previous years: to provide inseason catch, stock ID and effort data for input into the SMM to estimate the inriver run size; and, to determine migratory timing and stock composition of the sockeye run for use in the postseason estimations of the inriver sockeye and coho run sizes. Unfortunately, no sockeye test fishing was conducted during the month of July due to the prolonged commercial fishery openings as well as contractual problems. As mentioned above, the July test fish catches were calculated based on the performance of the commercial fishery and the historical correlation between commercial and test CPUE, 1996-04. The objectives of the coho test fishery were: to provide a measure of run timing through the fishery; age and gender profiles; and, to assess the relative run size (relative to the sockeye run size for which estimates are generated) based on catch per unit.

## Lower Stikine River Commercial Fishery

Canadian commercial fishers in the lower Stikine River harvested 15,098 large Chinook, 1,955 jack Chinook, 95,791 sockeye, 72 coho, and 14 chum salmon in 2006 (Appendix A.12). All pink salmon and steelhead trout were released. The sockeye catch was a record high. The catch of large Chinook salmon in the second year of the new, targeted fishery was second only to 2005. The catch of jack Chinook salmon was above average, while coho and chum catches were below average.

The stock composition estimates (Table 3), of the lower river sockeye catch were as follows: 39,888 planted Tahltan fish, which accounted for $42 \%$ of the sockeye catch; 31,685 wild Tahltan fish accounting for $33 \%$ of the catch; 7,139 mainstem fish accounting for $8 \%$ of the catch; and 17,079 planted Tuya fish which accounted for $18 \%$ of the catch.

Stock compositions of the commercial catch taken in the targeted Chinook and coho fisheries are not available; however, assuming that the Chinook catch reflects the contribution of the Little Tahltan and 'other' stocks to the total inriver escapement, the commercial catch of Chinook salmon of Little Tahltan origin is estimated at 2,497 large Chinook salmon, the catch of large Chinook salmon originating from 'other' stocks is estimated at 13,285 fish.

Weekly Chinook and sockeye guideline harvests, based on SCMM and SMM forecasts of the TAC apportioned by average run timing and domestic and international allocation agreements, were developed each week to guide management decisions during the Chinook and sockeye seasons. For purposes of managing the lower river catch, it was assumed catches of 1,800 large Chinook salmon would occur in the upper Stikine: 200, 200, and 1,400 large Chinook salmon in the sport, upper commercial and Aboriginal fishery, respectively. It was assumed the upper Stikine commercial and aboriginal fisheries, combined, would harvest 6,500 sockeye salmon. The balance of the Chinook and sockeye TAC were allocated to the lower Stikine commercial fishery. Particular attention was directed at weekly Chinook guideline harvests and the inriver run and escapement projections of the various sockeye stock groups. Management through week 26 was focused primarily on the harvest of large Chinook salmon. From week 27 through 30, management emphasis switched to the Tahltan Lake sockeye stock after which time the sole focus was the management of mainstem sockeye stocks through the end of August. Coho management focus commenced near the end of August.

The Chinook fishery commenced at noon May 07, week 19 for a scheduled opening of two days. Fishers were limited to two nets with a maximum length of 135 metres. The maximum mesh size was 203 mm . Only one of the two nets was permitted to be deployed as a drift gillnet. The upper boundary of the fishing zone extended to a point near the confluence of the Porcupine and Stikine rivers. The opening was based on a preseason Canadian guideline harvest for week 19 of 123 large Chinook salmon. Water levels were extremely low. The fishery was held at two days resulting in a catch of 150 large Chinook salmon.

The fishery was opened for three days in week 20 with a target of 540 large Chinook salmon. Extremely low water probably contributed to a relatively high harvest after two days of fishing ( $\mathrm{n}=840$ fish) which resulted in an emergency closure after 2.2 days of fishing. The final catch for week 20 was almost twice the weekly allocation. Tagging success at Kakwan was near record and tagged fish were arriving at the fishery within one or two days (average run timing to the fisher from the tagging site is $10-12$ days). A model estimate of $>90,000$ large Chinook salmon was generated late in the week. This estimate was reduced by $25 \%$ (69,300 Chinook salmon) to account for what was judged to be unusually good fishing conditions, and, therefore, an artificially high run projection.

The fishery was opened for two days in week 21 with a target of $\sim 1,200$ large Chinook salmon. The total run size governing this week's fishery was 69,300 Chinook salmon. The water level increased this week which probably negatively affected harvest. The fishery was extended in two, one-day blocks. No further extensions were granted in deference to the overage in catch during week 20. The total catch for this week was 925 Chinook salmon, slightly below the weekly allocation of 1,200 fish. The catches at Kakwan Point tagging site remain above average. The model estimate of 73,900 generated late in the week governed the week 22 opening. U.S. CPUE in District 108 was close to the CPUE observed in 2005.

The fishery was opened for three days in week 22 with a target of $\sim 1,600$ large Chinook salmon and a projected run size of 73,900 fish. The water level rose slightly this week and appeared to crest. The fishery was extended in two, two-day blocks with a projected catch this week of 950 fish. The actual catch was 1,231 fish, slightly below the weekly quota. The model estimate of 65,800 Chinook salmon generated late in the week governed the week 23 fishery. U.S. CPUE in District 108 was again close to the CPUE observed in 2005.

The fishery was opened for three days in week 23 with a weekly target of $\sim 1,800$ large Chinook salmon and a projected run size of 65,800 fish. The water level dropped slightly in mid week. The fishery was extended two days. The total catch this week was 1,754 large Chinook salmon, close to the weekly quota of 1,800 fish. The low catches at Kakwan Point and the relatively low CPUE in the commercial fishery were disconcerting in light of a large projected run size of 65,800 fish. The U.S. catch, however, remained strong in District 108. The model estimate of 64,800 Chinook salmon generated late in the week governed the week 24 fishery.

The fishery was posted for three days in week 24 with a weekly target of $\sim 2,100$ large Chinook salmon and a projected run size of 64,800 fish. The water level rose dramatically during the course of the fishery. The fishery was extended in two, two-day blocks for a total fishing time of seven days. The run was expected to peak based on historical run timing; however, it was judged that large numbers of fish had not yet entered the river, and very poor fishing conditions prevented the fleet from harvesting the relatively small run component available to the fishery this week. The total catch for week 24 was 1,200 fish, well below this week's quota of 2,100 large Chinook salmon. Notwithstanding the extremely high water conditions, the poor catches at the Kakwan Point tagging site continued to cause concern. District 108 CPUE, however, remained strong, which indicated that the run was probably somewhat late entering the river. The model estimate (judged to be low) and the mark-recapture estimate (judged to be high) were averaged resulting in a run size estimate of $\sim 70,000$ large Chinook salmon which governed week 25 fishery.

The fishery was opened for three days in week 25 with a target of $\sim 2,400$ large Chinook salmon and a projected run size of 70,000 fish. The upper fishing boundary was extended approximately 24 km to a point near the mouth of the Flood River. (note: no boats fished the newly opened zone in week 25). Typically, management emphasis switches to sockeye salmon this week; however, the fleet continue to target Chinook salmon. The water level finally started to recede. After three days fishing and a combined catch of only 1,200 fish, a decision was made to extend the fishery for four days. The final four days of fishing resulted in both record catches of 5,300 fish and a dramatic overage in the weekly quota. The dramatically high water the previous week was thought to have delayed entry of Chinook salmon into the fishing zone. This week saw both peak catches and was the peak migration week. The catches at the Kakwan Point tagging site finally showed some improvement. The model estimate (judged to be low) and the markrecapture estimate (judged to be high) were again averaged resulting in a mid week run size estimate of $\sim 61,000$ large Chinook salmon. Only 137 sockeye salmon were harvested
this week. Sockeye CPUE in both Districts 106 and 108 were below average, but it was suspected that a large measure of the fleet continued to target Chinook salmon during the course of the sockeye fishery.

In week 26, it was estimated that approximately $70 \%$ of Stikine River fishers continued to target Chinook salmon. Management emphasis was on both sockeye and Chinook salmon. The fishery initially opened for three days. A one day extension was granted based on an increased estimated Chinook run size generated during the middle of the week. The total Chinook catch for the week was $\sim 2,600$ fish, above the initial weekly quota of 1,400 Chinook salmon, but close to the quota that was based on the mid week run size estimate of $\sim 73,100$ fish. The First Nations Chinook catch started to increase; however, it was negatively impacted by high water. The sockeye catch and CPUE were below average in the lower fishery and the guideline catch of $\sim 5,000$ was not met. The total sockeye catch was 1,835 fish. The District 106 and 108 CPUE of sockeye salmon remained below average.

During week 27 all permit holders targeted sockeye salmon. The preseason sockeye forecast of 179,000 fish and a weekly guideline harvest of approximately 27,000 Tahltan Lake sockeye salmon resulted in an initial three-day opening, with possible extensions. The model estimate this week generated a Tahltan Lake sockeye run size of approximately 200,000 fish and a guide line harvest of 53,000 sockeye salmon. The US District 106 and 108 catch in week 26, however, showed indications that the run might not meet expectations. After one day of fishing in the Canadian commercial fishery it was apparent that the run might be well above average. The run continued to hold in day two with near record catches reported. The fishery was extended four days. The final weekly catch of 32,000 fish, including 27,500 Tahltan Lake sockeye salmon was close to the preseason weekly guideline harvest, but below the available harvest numbers generated by the model. Daily otoliths and egg diameters were collected since week 25 . The data showed a high portion of Tahltan and Tuya sockeye salmon, with up to $50 \%$ of the run comprised of small, age four fish. The relatively high numbers of Tuya fish (10-15\%) was unexpected. The Tuya preseason forecast was for less than 3,000 fish. The inseason Tuya projection this week was estimated to be between $20,000-30,000$ sockeye salmon. The Chinook catch of 1,400 fish was below the weekly quota of 1,800 .

In week 28 the fishery opened for three days with possible extensions in response to model updates. The initial model run indicated at Tahltan Lake run size of 177,000 fish and a guideline harvest of 22,000 sockeye salmon. The fishery was extended in two, twoday blocks in response to high catches and CPUE and an updated model estimate for a Tahltan Lake sockeye run of 205,000 fish and guideline harvest of 33,000 fish. The mark-recapture estimate also indicated at very strong run of Tahltan Lake sockeye salmon. The final catch of 31,000 sockeye salmon, including 24,500 Tahltan Lake fish, was slightly below the weekly harvest guideline. Tuya and mainstem sockeye salmon constituted the balance of the catch. Sockeye salmon arrived in small numbers at Tahltan Lake this week. The First Nations catches were below seasonal averages, which may be due to the poor gear efficiency caused by high water in concert with the late arrival of the stock.

In week 29 the fishery opened for three days with possible extensions. The model run indicated a Tahltan Lake run size of 218,000 fish and a guideline harvest of 33,000 sockeye salmon. The model also indicated that the mainstem run was weak with a total run size of only 17,000 fish. It was suspected that the mainstem estimate was in error. The mark-recapture estimate continued to indicate a very strong Tahltan Lake sockeye run, and a below average mainstem component. In light of the available Tahltan Lake sockeye TAC and the strong catches in day one, the fishery was extended for two days. No further extensions were granted due to the concern for relatively weak showing of mainstem sockeye salmon. The total sockeye catch this week was 22,000 fish, 16,500 of which were of Tahltan Lake origin and approximately 2,000 were of mainstem. Tuya Lake origin sockeye salmon constituted the balance of the catch. The CPUE of 20 fish per net day of mainstem fish was half the average. Sockeye counts at Tahltan Lake were increasing but the First Nations catches remain below seasonal averages.

In week 30 the fishery opened for three days with possible extensions. The model run indicated at Tahltan Lake run size of 262,000 fish and a guideline harvest of 37,000 sockeye salmon. It was obvious that the target would not be met in light of Tahltan Lake sockeye run timing that shows, on average; over $90 \%$ of the Tahltan run has transited the fishery by this time. The model also indicated that the mainstem run was weak with a total run size of only 22,000 fish. The veracity of the mainstem model estimate remained in question. As in week 29, the mark-recapture estimate continued to indicate a very strong Tahltan Lake sockeye run and a below average mainstem component. In light of the available Tahltan Lake sockeye TAC and the poor fishing conditions resulting from near record high water levels, the fishery was extended for two days. No further extensions were granted due to the concern for relatively weak showing of mainstem sockeye salmon. The total sockeye catch this week was $4,400,2,900$ of which were of Tahltan Lake origin and approximately 700 were mainstem fish. Tuya Lake origin fish constituted the balance of the catch. The first coho salmon was harvested this week. The CPUE of mainstem sockeye salmon was below average. This was, in part, due to the poor fishing conditions. Sockeye counts at Tahltan Lake were well above average with a projected weir count of 51,000 fish. The First Nations catches remained below seasonal averages.

In week 31 the fishery opened for three days with possible extensions. The model continued to indicate a weak run of mainstem fish. The mark-recapture total run estimate of 40,000 mainstem fish was twice the model estimate. Fishing effort started to wane this week. Notwithstanding the fishing effort, the fishery was held at three days. The total sockeye catch this week was 5,500 fish, 3,400 of which were of Tahltan Lake origin and approximately 1,600 were mainstem fish. Tuya Lake origin sockeye salmon constituted the balance of the catch. The CPUE of mainstem fish was approximately half the average. The sockeye test fishery started this week. Overall the test CPUE was above average as was the CPUE of mainstem fish. Sockeye counts at Tahltan Lake remained high with a projected weir count was 45,000 fish. The First Nations catches remained below seasonal averages.

In week 32 the fishery opened for three days with possible extensions. The model continued to indicate a weak run of mainstem fish. As in week 32 the mark-recapture total run estimate of 39,000 mainstem fish was close to twice the estimate generated from the model. Approximately $50 \%$ of the fleet concluded their 2006 commercial fishing activity. The remaining fishers expended only light effort this week. . The total sockeye catch this week was 800 fish, half of which were of mainstem origin. Tuya and Tahltan origin sockeye salmon constituted the balance of the catch. A total of 45 coho salmon was also harvested this week. (Note: the fleet show no indications of targeting coho salmon this year.) The CPUE of mainstem fish improved and to above average. The cumulative sockeye count at Tahltan Lake this week was 47,000 fish. The First Nations catches remain below seasonal averages.

In week 33 the fishery opened for three days with possible extensions. The model continued to indicate a weak run of mainstem fish. The mark-recapture total run estimate increased to 50,000 mainstem fish. There was no commercial fishing effort this week. The sockeye test fishery overall CPUE was above average, with the bulk of catch consisting of mainstem sockeye salmon. The cumulative sockeye count at Tahltan Lake this week was 48,500 fish. The First Nations fishery concluded this week.

In week 34 the fishery opened for three days with possible extensions. The model continued to indicate a weak run of mainstem fish. The mark-recapture total run estimate increased to 62,000 mainstem fish. There was very little commercial fishing effort this week and the total catch was 5 sockeye and 9 coho salmon. The sockeye test fishery overall CPUE was above average, with the bulk of catch consisting of mainstem sockeye salmon. The cumulative sockeye count at Tahltan Lake this week was 52,500 fish.

In week 35 the fishery was extended through till 20 October with the expectation that there would, in all likelihood, be no commercial or very light commercial fishing activity. The objective of the prolonged opening was to provide an opportunity for Canadian fishers to harvest the 5,000 coho quota if they so wished to. All commercial fishers vacated the fishery by mid-September. The sockeye test fishery ended this week and was replaced with a coho test fishery which operated through mid October.

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. A total of 520 sockeye, 1 jack Chinook, and 22 large Chinook salmon were caught in 2006, all of which were below average (Appendix A. 14). The fishing effort was also below average with only 15 boat-days fished. Generally, fishery openings were based on the lower Stikine commercial fishery openings, lagged one week. The first opening, however, was concurrent with the lower fishery opening.

## Aboriginal Fishery

The Stikine River aboriginal fishery, which is located near Telegraph Creek, harvested 616 large Chinook, 122 jack Chinook, 5,094 sockeye, and 4 pink salmon (Appendix A. 15). The Chinook and sockeye harvests were below average. As in 2004 and 2005,
sockeye salmon were up to two weeks late arriving to the fishing grounds. It appears that the run was relatively protracted and did not exhibit a distinct peak in week 29 as is the normal pattern. High water may have reduced harvest efficiency in mid July. The below average Chinook catches may have been due to the unusually high water conditions that occurred during the Chinook run as well as the abundance of Chinook within the fishing grounds.

## Sport Fishery

The Stikine River sport fishery targets primarily Chinook salmon and its principal fishing location is located at the mouth of the Tahltan River. Minor sport fishing activities occur in upper reaches of the Tahltan River and in some tributaries of the Iskut River, including Verrett and Craig River. The 2006 the catch estimate of 46 large Chinook salmon is below average. The low catches were a product of minor fishing effort in concert with extremely high water and relatively low abundance. Catches at Verrett River (all released) were anecdotally reported as poor by the local lodge owner. It should be noted that, based on the annual Verrett River carcass pitch, the Verrett River Chinook salmon were probably late arriving. This unusual run timing may have resulted in the lodge operator missing the peak migration.

## Escapement

## Sockeye Salmon

The total of 53,855 sockeye salmon counted through the Tahltan Lake weir in 2006 was twice the average (Appendix A.19). The 2006 count was the fifth highest count on record (1959-2006) and was approximately $80 \%$ above the upper end of the escapement goal range of 18,000 to 30,000 fish. An estimated 26,056 fish ( $48 \%$ ) originated from the fryplanting program, which is close to the $50 \%$ contribution of smolts observed in 2003, the principal cycle year contributing to the 2006 run. A total of 400 sockeye salmon was sacrificed at the weir for stock composition analysis. In addition, a total of 3,403 sockeye salmon was collected for broodstock, resulting in a spawning escapement of 50,052 sockeye salmon in Tahltan Lake.

The spawning escapements for the Mainstem and the Tuya stock groups are calculated using stock ID, test fishery and inriver catch data. Because the commercial fishing activity concluded before the run terminated, egg diameters from the test fishery were used for stock composition estimates for the last weeks of the sockeye run. A proxy CPUE was used for these same weeks based on a linear regression of District 108 CPUE of Stikine fish vs. inriver commercial CPUE with intercept forced to zero ( $\mathrm{R}^{2}=.71$ ). This calculation resulted in escapement estimates of 27,603 mainstem and 9,977 Tuya sockeye salmon. An alternative method based on using commercial fishery CPUE and using proxy test fishery catches for weeks 32 and later, yielded nearly identical results. These proxy figures were based on the linear relationship between the commercial CPUE and the test fishery CPUE in 1986-04. All of the weekly data set were significantly correlated. Based on this run reconstruction approach, the escapement estimates were 27,000

Mainstem and 10,000 Tuya sockeye salmon. The Mainstem spawning escapement estimate is within the escapement goal range of 20,000 to 40,000 fish. Aerial survey counts of Mainstem sockeye salmon also indicated an average run. The index count of 943 fish was close to the average of 983 fish.

The existence of enhanced Tuya escapement continues to be a concern because of straying (confirmed from radio telemetry studies and analysis of thermal marks) to other Stikine River tributaries. Furthermore, the injury to Tuya River sockeye salmon attempting to ascend the lower reaches of the Tuya River is evident based on reports from First Nations fishers and stock assessment personnel. (A study on the behavior of Tuya strays that was conducted in August and September, 2004 and April and May 2005 concluded that in the short term the straying of Tuya River sockeye salmon does not pose a genetic risk to natural Stikine River salmon; however, over the long term, given enough straying sockeye salmon, that interaction of Tuya strays with natural sockeye salmon may occur.) To address problems associated with fish capture in the lower Tuya River, a newly designed fishway/trapping apparatus was constructed during the spring of 2006. Unfortunately the Tuya fish trapping project was not prosecuted because of a major rock slide at the Tuya River fishing site that occurred sometime in June 2006. The rockslide rendered the fishing site, for which the fish trap was tailored, unusable due to changes in river hydrology as well as the unsafe working conditions at the site. The fishway, which including a fish trap, was designed to increase the terminal harvest capability for enhanced Tuya sockeye salmon while still allowing indigenous species to bypass the capture site.

A steering committee, consisting of Canadian and US engineers and others visited the site in August 2006 to assess the conditions and to consider and discuss other fish capture options. The steering committee is presently addressing the challenge of fish capture, but an approach to Tuya fish harvest options in the 2007 season has not yet been formally tabled.

For the seventh consecutive year, a sockeye mark-recapture program was conducted to develop an alternate abundance-based management regime for Stikine River sockeye salmon. Unfortunately, the original capture site located approximately 15 km downstream from the commercial fishing grounds could not be fished due changes in river hydrology. Alternate sites located upstream and downstream from the original site were utilized. Yet another obstacle to this year's study was the paucity of recovery effort during the month of August. The inriver estimate, therefore, was calculated based on recoveries up to 05 August when, on average approximately $95 \%$ of the sockeye salmon would have transited the fishery. The total estimate was expanded accordingly. The estimate of the total escapement using a modified Peterson estimate is approximately 161,600 sockeye salmon (marked=653, recovered=250, catch=95,116, minus inriver catch), with a 0.95 confidence interval ranging from 136,100 to 187,100 fish. The point estimate is $61 \%$ of the postseason escapement estimate 91,435 (independently derived from stock ID and run reconstruction), but only $1 \%$ above the escapement estimate of 158,000 fish generated from the final run of the SMM. The stock-specific escapement estimates based on the
mark-recapture study were 92,400 Tahltan, 16,600 Tuya, and 56,700 mainstem sockeye salmon.

## Chinook Salmon

The 2006 Chinook escapement enumerated at the Little Tahltan weir was 3,860 large fish and 93 jack Chinook salmon (Appendix A.21). The escapement of large Chinook salmon in the Little Tahltan River was approximately half of average, but close to the mid point escapement goal of 4,000 large Chinook salmon (escapement goal range: 2,700 to 5,300).

A mark-recapture study was conducted again in 2006 concurrent with the SCMM to assess the inriver Chinook abundance. Mark-capture estimates were calculated after week 24. The estimate of total system-wide spawning escapement, based on spawning ground tag recoveries only, is 24,399 large Chinook salmon which is less than average. The escapement to the Little Tahltan River represented approximately 16\% of the total Stikine River escapement, compared to an average of $20 \%$.

## Coho Salmon

Aerial surveys of eight index sites were conducted on 02-03 November. The combined count of 2,200 coho salmon, under relatively good viewing conditions, was $40 \%$ of average.

A coho test fishery was conducted from mid August to October 15. Utilizing a standard drift gillnet ( 33 metre by 30 mesh by $8-9 \mathrm{~cm}$ mesh size) fishing a specific site, the test fishery cumulative weekly CPUE was 5.5 coho salmon, which was above the average of 4.06. The 2006 sockeye test fishery was conducted during the month of August due to protracted commercial fishery openings. In past studies, the relative inriver run size of coho salmon was calculated based on the sockeye CPUE and the associated inriver abundance estimate. The general assumptions in the calculation were the test fish CPUE was correlated with inriver run size and that the coho test fishery efficiency was similar to that of the sockeye test fishing efficiency.

## Sockeye Salmon Run Reconstruction

The terminal Stikine River sockeye run size was estimated to be 268,584 fish. Of this number, approximately 185,097 were of Tahltan Lake origin (wild \& planted), 37,982 were of Tuya origin (fry from Tahltan broodstock planted into Tuya Lake), and 45,559 were mainstem stocks (Table 3). These estimates are based on postseason analysis of scale patterns and thermal mark analysis for marine harvests and egg diameter and thermal mark analysis for inriver harvests. The 2006 total run was above average and above the preseason forecast of 179,000 fish.

## TAKU RIVER

Taku River salmon are harvested in the U.S. drift gillnet fishery in the Alaskan District 111, in northern Southeast Alaska seine and troll fisheries, and in the Juneau area sport fishery and inriver personal use fishery (Figure 2). Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an aboriginal fishery, and a sport fishery.

Figure 2. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Regulations

New fishing arrangements were in place in 1999 as a result of negotiations between Canada and the United States of Annex IV, Chapter 1 of the PST. The arrangements that are expected to apply to the Taku River for the 1999 to 2008 period are as follows:
(1) Sockeye salmon:
(i) Except as noted below, Canada shall harvest no more than $18 \%$ of the TAC of the wild sockeye salmon originating in the Canadian portion of the Taku River each year;
(ii) If the projected inriver escapement is greater than 100,000 sockeye salmon, Canada may, in addition, harvest $20 \%$ of the projected inriver escapement above 100,000 sockeye salmon;
(iii) The Parties agree to manage the runs of Taku River sockeye salmon to ensure that each country obtains catches in their existing fisheries equivalent to each country's share of wild sockeye salmon and a $50 \%$ share of fish originating from Taku River fry plants;
(iv) The Parties agree to continue the existing joint Taku River enhancement program designed to produce annually 100,000 sockeye salmon run.
(2) Coho salmon:
(i) The Parties agree to develop and implement an abundance-based approach to managing coho salmon on the Taku River no later than May 1, 2004. The Parties commit to developing a revised MSY escapement goal to be implemented no later than May 1, 2004.
(ii) Until a new abundance-based approach is developed, the management intent of the United States is to ensure a minimum above-border inriver run of 38,000 coho salmon, and the following arrangements will apply:
a. no numerical limit on the Taku River coho salmon catch will apply in Canada during the directed sockeye salmon fishery (through statistical week 33);
b. if inseason projections of above-border run size are less than 50,000 coho salmon, a directed Canadian harvest of up to 3,000 coho salmon is allowed for assessment purposes as part of the joint Canada/US Taku River mark-recapture program;
c. if inseason projections of above-border run size exceed 50,000 coho salmon, a directed Canadian harvest of 5,000 coho salmon is allowed;
d. if inseason projections of above-border run size exceed 60,000 coho salmon, a directed Canadian harvest of 7,500 coho salmon is allowed;
e. if inseason projections of above border run size exceed 75,000 coho salmon, a directed Canadian harvest of 10,000 coho salmon is allowed.
(3) Chinook salmon:
(i) This agreement shall apply in 2005 through 2008.
(ii) This agreement shall apply to large (greater than 659 mm mid-eye to fork length) Chinook salmon originating in the Taku River.
(iii) Both Parties shall take the appropriate management action to ensure that the necessary escapement goals for Chinook salmon bound for the Canadian portions of the Taku River are achieved. The Parties agree to share in the burden of conservation. Fishing arrangements must take biodiversity and ecosystem requirements into account.
(iv) Consistent with paragraph 2 above, management of directed fisheries will be abundance-based through an approach developed by the Committee. The Parties agree to implement assessment programs in support of the abundance-based management regime.
(v) Unless otherwise agreed, directed fisheries on Taku River Chinook salmon will occur only in the Taku River drainage in Canada, and in District 111 in the U.S.
(vi) Management of Taku River Chinook salmon will take into account the conservation of specific stocks or conservation units when planning and prosecuting their respective fisheries. To avoid over harvesting of specific components of the run, weekly guideline harvests will be developed by the Parties by apportioning their allowable harvest over the total Chinook salmon season based on historical weekly run timing.
(vii) By 2008, the Parties agree to develop and implement through the Committee an agreed Chinook salmon stock identification program to assist the management of Taku Chinook salmon.
(viii) The current MSY escapement goal point estimate ( $\mathrm{N}_{\text {MSY }}$ ) for above-border Taku River Chinook salmon is 36,000 fish (greater than 659 mm mid-eye to fork length) with a range of 30,000 to 55,000 fish. This goal is subject to periodic review by the Parties.
(ix) A preseason forecast of the Taku River Chinook salmon terminal run size will be made by the Committee by February 1 of each year.
(x) In 2005 and 2006, directed fisheries may be implemented based on preseason forecasts only if the preseason forecast terminal run size equals or exceeds the upper end of the MSY escapement goal range plus the combined Canada, U.S. and test fishery base level catches (BLCs) of Taku River Chinook salmon. The preseason forecast will only be used for management until inseason projections become available.
(xi) For the purposes of determining whether to allow directed fisheries using inseason information in 2005 and 2006, such fisheries will not be implemented unless the
projected terminal run size exceeds the mid-point of the escapement goal range plus the combined Canada, U.S. and test fishery BLCs of Taku River Chinook salmon. The Committee shall determine when inseason projections can be used for management purposes and shall establish the methodology for inseason projections and update them weekly or at other agreed intervals.
(xii) If escapements in 2005 and 2006 are less than the escapement goal point estimate $\left(\mathrm{N}_{\text {MSY }}\right)$, the Parties agree to review the 2005 and 2006 directed fisheries and implement additional precautionary management measures intended to achieve the escapement goal point estimate ( $\mathrm{N}_{\mathrm{MSY}}$ ) in 2007 and 2008.
(xiii) In 2007 and 2008, directed fisheries may be implemented based on preseason forecasts only if the preseason forecast terminal run size equals or exceeds the escapement goal point estimate ( $\mathrm{N}_{\mathrm{MSY}}$ ) plus the combined Canada, U.S. and test fishery base level catches (BLCs) of Taku River Chinook salmon. The preseason forecast will only be used for management until inseason projections become available.
(xiv) For the purposes of determining whether to allow directed fisheries using inseason information in 2007 and 2008, such fisheries will not be implemented unless the projected terminal run size exceeds the escapement goal point estimate ( $\mathrm{N}_{\mathrm{MSY}}$ ) plus the combined Canada, U.S. and test fishery BLCs of Taku River Chinook salmon. The Committee shall determine when inseason projections can be used for management purposes and shall establish the methodology for inseason projections and update them weekly or at other agreed intervals.
(xv) The allowable catch (AC) is calculated as follows:
[Base terminal run (BTR) = escapement target + test fishery BLC + U.S. BLC + Cdn BLC]
[Terminal run - (BTR) = AC]
(xvi) BLCs include the following:
a. U.S. Taku BLC: 3,500 large Chinook salmon
b. Canadian Taku BLC: 1,500 large Chinook salmon
c. Test fishery: 1,400 large Chinook salmon;
(xvii) Harvest sharing and accounting of the AC shall be as follows:

| Allowable Catch Range |  | Allowable Catch Share |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | U.S. |  | Canada |  |
| Lower | Upper | Lower | Upper | Lower | Upper |
| 0 | 5,000 | 0 | 0 | 0 | 5,000 |
| 5,001 | 20,000 | 1 | 11,000 | 5,000 | 9,000 |
| 20,001 | 30,000 | 11,001 | 17,500 | 9,000 | 12,500 |
| 30,001 | 50,000 | 17,501 | 30,500 | 12,500 | 19,500 |
| 50,001 | 100,000 | 30,501 | 63,000 | 19,500 | 37,000 |

Within each Allowable Catch Range, each Party's Allowable Catch Share will be calculated proportional to where the AC occurs within the range.
(xviii) The U.S. catch of the Taku Chinook salmon AC will not count towards the SEAK AABM allocation. In particular:
a. non-Taku Treaty Chinook salmon harvested in District 111 will continue to count toward the SEAK AABM harvest limit;
b. the U.S. BLC of Taku Chinook salmon in District 111 will count toward the SEAK AABM harvest limit;
c. the U.S. catch of Taku Chinook salmon in District 111 above the U.S. BLC will not count towards the SEAK AABM allocation.

Accounting for the SEAK AABM Chinook salmon catches as pertains to transboundary rivers harvests will continue to be the responsibility of the Chinook Technical Committee as modified by (a) through (c) above.
(xix) The Parties shall determine the domestic allocation of their respective harvest shares.
(xx) When the terminal run is insufficient to provide for the Party's Taku Chinook salmon BLC and the lower end of the escapement goal range, the reductions in each Party's base level fisheries, i.e. the fisheries that contributed to the BLCs, will be proportionate to the Taku Chinook salmon BLC shares, excluding the test fishery.
(xxi) When the escapement of Taku River Chinook salmon is below the lower bound of the agreed escapement range for three consecutive years, the Parties will examine the management of base level fisheries and any other fishery which harvests Taku River Chinook salmon stocks, with a view to rebuilding the escapement.

## U.S. Fisheries

The traditional District 111 commercial drift gillnet salmon fishery, including the new directed Chinook fishery, was open for a total of 89 days from May 22, through October 19, 2006 (Appendix C.1), with no effort reported during weeks 41 and 42 . The harvest totaled 11,106 large Chinook, 136 jack Chinook, 134,781 sockeye, 59,422 coho, 185,102 pink, and 381,837 chum salmon. Harvests of Chinook, coho, pink and chum salmon were above average while the sockeye harvest was below average. Weekly commercial fishery harvests and stock composition estimates for these fisheries are provided in Appendices С.1-C. 3

Hatchery stocks contributed significantly to the numbers of both sockeye and chum salmon harvested and minor numbers to the harvest of other species. The 2006 season was the seventh year of significant numbers of adult sockeye salmon returning to the Snettisham Hatchery inside Port Snettisham. These fish contributed significantly to the harvests primarily in Stephens Passage and to the Speel Arm Terminal Harvest Area (THA) fishery inside Port Snettisham.

The total traditional drift gillnet Chinook harvest in District 111 in 2006 was 11,106 large fish and 136 jacks. The total number of Chinook salmon caught in the second season of
the new directed Chinook fishery between weeks 21 and 28 totaled 11,181 fish. Of these, an estimated 11,045 were large fish. After subtracting out the Alaska and non-Alaska hatchery component, 10,524 fish were counted against the US AC. The Chinook harvest after week 28 was 57 fish. As estimated by coded wire tag (CWT) analysis, Alaskan hatcheries contributed a total 525 fish, or 5\% of the total 2006 District 111 Chinook harvest. Alaskan hatchery Chinook salmon do not count towards the US AC for the directed Chinook fishery.

The Taku River stock assessment program at Canyon Island provided data to estimate the above-border Chinook run. This data with the spawning ground mark-recapture data indicated an above border escapement of 42,262 large Chinook salmon, near the midpoint of the escapement goal range of 30,000 to 55,000 fish.

The traditional District 111 sockeye harvest was 134,781 fish, roughly 30,000 fish below average (Appendix C.1). Weekly sockeye harvests in District 111 were below average in weeks 25-31 and 40. Weekly sockeye harvests were above average during weeks 32-38. Weekly sockeye CPUE was below average in weeks $25-29$ and 39 and above average for weeks $30-38$ and 40 . Domestic hatchery sockeye stocks began to contribute to the traditional fishery in week 25 and added significant numbers to the harvests in weeks 2935. Fishers targeting these runs of hatchery sockeye salmon and the Limestone Inlet hatchery chum salmon increased the amount and percentage of fishing effort that occurred in Stephens Passage. Of the total traditional District 111 sockeye harvest, 26\% occurred in Stephens Passage, 3\% more than average. An estimated 62,813 wild Taku and 5,939 wild Port Snettisham fish were harvested in the traditional District 111 fishery (Appendices C. 2 and C.3). Sockeye salmon from a joint U.S./Canada fry-planting program at Tatsamenie Lake contributed an estimated 2,210 fish to the fishery (2\% of the harvest; Table 4. Appendix C.3). Contributions of U.S. hatchery sockeye salmon to the traditional District 111 drift gillnet fishery totaled 59,178 fish or $44 \%$ of the harvest (an estimated 28,659 hatchery fish were harvested in District 111 in areas outside of Port Snettisham). These were predominately Port Snettisham hatchery sockeye salmon but also included a small number of thermally marked fish from a fry-planting program at Sweetheart Lake in Port Snettisham. An additional 127,700 sockeye salmon were harvested in the Speel Arm THA fishery inside Port Snettisham. The majority of these fish are from hatchery releases but a small portion of wild Speel Lake sockeye stocks are also taken in this fishery.

The traditional District 111 chum harvest of 381,837 fish was above average (Appendix C.1). The summer chum harvest of 374,130 fish comprised $98 \%$ of the season's chum harvest. The summer chum run is considered to last through mid-August, week 33, and was comprised mostly of domestic hatchery fish, with small numbers of wild fish contributing to the harvest. Chum runs to DIPAC hatcheries in Gastineau Channel and to the DIPAC remote release site at Limestone Inlet contributed a major portion of the harvest but quantitative contribution estimates were not available. Approximately $59 \%$ of the total traditional District 111 chum harvest was made in Taku Inlet, 39\% in Stephens Passage, and 2\% inside Port Snettisham. The harvest of 7,707 fall chum salmon, during weeks 34 through the end of the fishery, was above average. Most of these chum salmon are assumed to be wild fish of Taku and Whiting Rivers origin.

${ }^{\text {a }}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for catches other than the listed fisheries.

The District 111 pink harvest of 185,102 fish was above average (Appendix C.1).
Coho stocks harvested in District 111 include runs to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams as well as Alaskan hatcheries. The traditional District 111 coho harvest of 59,422 fish was above average (Appendix C.1). Weekly coho harvests were above average during weeks $25-29$, 32, and 34-38. Weekly coho harvests were below average during weeks $30,31,33$, and 39-42. Coho CPUE was above average during weeks 26-32, and 34-37. CWT analyses indicate Alaskan hatchery coho salmon contributed 2,000 fish or $3 \%$ of the traditional District 111 harvest. For the
entire season, weekly estimates of Taku River coho abundance indicated an above average run size.

For the 2006 season, gillnet fishing time in the traditional District 111 areas during the new directed Chinook fishery during weeks 21-24 was eight days. During weeks 25-42, gillnet fishing time was $53 \%$ above average. The maximum number of boats participating in the fishery in a given week was 55 boats during week 23 in the directed Chinook fishery and 78 boats during week 32 during the remainder of the season (Appendix C.1). Fishing effort as measured by the total number of boats delivering fish each week times the numbers of days open to fishing was 402 boat-days for the directed Chinook fishery, and 3,132 boat-days for the remainder of the season, which was average.

Management actions for the 2006 drift gillnet directed Chinook fishery were limited to time restrictions as the area open remained the same throughout the fishery. In January 2006, the BOF adopted new regulations for the District 111 directed Chinook fishery, including a minimum mesh restriction through the third Sunday in June and adjustments to the boundaries of the directed gillnet and troll areas. The revised southern boundary of the directed gillnet area was moved south to the latitude of Grave's Point and the eastern boundary was moved slightly to a line from Point Arden to Point Bishop, the same boundary used during the traditional section 111B gillnet fishery. The US AC was determined by a Pacific Salmon Commission bilaterally agreed on formula based, during the early season, on the preseason Chinook run forecast, and revised inseason based on the inseason run projection estimates generated from the Canyon Island mark-recapture program. The AC applied only to large Taku River origin Chinook salmon, fish over 28 inches in length ( 660 mm MEF). The US AC was shared between gillnet, troll and sport fisheries, with no set allocation for each user group. The regulations allow gillnetting May 1, through the third Sunday in June. This season, because the preseason forecast of 64,150 fish did not allow for a US fishery beginning May 1, the Taku gillnet directed Chinook fishery occurred between weeks 21-28 although management emphasis shifted to sockeye salmon after week 24 (the third Sunday in June). The preseason forecast did allow for a Canadian fishery to occur and it began on May 1, week 18. On May 17, week 20 the first jointly agreed upon inseason projection of 64,706 large Chinook salmon was announced, which compared favorably with the preseason forecast. Using the inseason projection, the management objective switched from the upper end of the escapement goal range $(55,000)$ to the midpoint of the escapement goal range $(42,500)$ for large Chinook salmon. Thus, the revised AC for U.S. and Canada was 15,803 Chinook salmon, of which the U.S. AC was 7,922 fish, and the Canadian AC was 7,881 fish. Weekly management decisions were based on Canyon Island fish wheel catches, run timing, fishery performance, and AC. The lack of recent historic data did not allow for comparison with past fisheries.

In week 21 the fishery was open for two days and 43 boats landed 1,108 Chinook salmon, of which 1,033 were large Taku River origin fish. Week 22 was open for 3 days with 54 boats landing 4,134 Chinook salmon, of which 3,957 fish were large Taku River origin fish. Being past the peak of the run, week 23 was open for 2 days with 55 boats landing 3,280 Chinook salmon, of which 3,182 fish were large Taku origin fish. Week 24 was
open for 1 day with 44 boats landing 1,044 Chinook salmon, of which 931 fish were large Taku origin fish. The total harvest of Chinook salmon taken in the District 111 gillnet fishery during the directed Chinook fishery, weeks $21-24$, was 9,566 fish. The total all gear harvest of Taku origin large Chinook salmon taken during the directed Chinook fishery in District 111 was 11,445 fish, including a commercial drift gillnet harvest of 9,103 fish, a commercial troll harvest of 11 fish, and the Juneau area sport harvest of 2,331 fish.

Management actions to conduct the Taku River directed sockeye gillnet fishery were limited to imposing restrictions in time and area. Because there is no bi-laterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fish wheel catches. As the fishing season progresses, sufficient data is acquired to estimate the inriver run size from the mark-recapture program at Canyon Island and to use that estimate in conjunction with migratory timing and historical fishery harvest data to forecast the entire Taku sockeye run. In the first week of the season, week 25, which began June 18, three days of fishing time were allowed in both Taku Inlet (Subdistrict 111-32) and Stephens Passage (Subdistrict 111-31). The traditional District 111 sockeye harvest in the first week was $22 \%$ of average. During week 26, the initial opening was reduced to two days in Taku Inlet, then extended an additional day with reported average CPUE in the gillnet fishery. The sockeye harvest in week 26 was $23 \%$ of average. The first inseason run estimate was 10,724 sockeye salmon above border (Table 5). With below average effort and improving inriver indicators, fishing time for week 27 was set for three days. The traditional District 111 sockeye harvest in week 27 was $63 \%$ of average. In week 28 Taku Inlet was limited to two days due to low inriver indicators and Stephens Passage was opened for three days and then extended an additional day to target the large run of hatchery chum salmon returning to Gastineau Channel and Limestone Inlet. The traditional District 111 sockeye harvest for the week was $31 \%$ of average. Approximately $60 \%$ of the sockeye salmon harvested during the week came from Taku Inlet, while the remainder was harvested in Stephens Passage. With low inriver indicators, Taku Inlet was again limited to two days during week 29, with Stephens Passage open for four days with the six inch mesh restriction to target Alaska hatchery chum salmon. The traditional District 111 harvest of 4,900 sockeye salmon was $19 \%$ of average with $79 \%$ of the harvest occurring in Taku Inlet.
During week 30, Taku Inlet north of the latitude of Circle Point was again limited to two days due to poor fishery CPUE and inriver indicators. The projected inriver estimate cast doubt on achieving the 75,000 fish escapement, and showed a negative US TAC. Stephens Passage was opened for four days to target hatchery chum salmon. The traditional District 111 sockeye harvest was $75 \%$ of average with $34 \%$ of the harvest taken in Taku Inlet. Analysis of otoliths revealed that 78\% (162 of 207) of the samples processed from Stephens Passage during this week were Snettisham hatchery origin sockeye salmon.

During week 31 Taku Inlet north of the latitude of Circle Point was opened initially for two days due to low but improving inriver indicators, and then extended an additional day with an increase in fish wheel catches, and an inriver projection indicating the 75,000 fish escapement would be achieved as well as a positive US TAC. Stephens Passage was
open for three days to protect transiting wild Port Snettisham sockeye salmon. The traditional District 111 sockeye harvest of 13,871 fish was $54 \%$ of average for the week, with $51 \%$ of the harvest in Taku Inlet. Analysis of otoliths revealed that $79 \%$ (201 of 255) of the samples processed from Stephens Passage during this week were Snettisham hatchery origin sockeye salmon. The traditional District 111 coho harvest was 916 fish for the week (Appendix C.1), $75 \%$ of average.

Table 5. U.S. inseason forecasts of terminal run size, TAC, inriver run size, and the U.S. harvest of Taku River sockeye salmon for 2006.

| Stat | Inriver | Terminal | Total | U.S. | Projected <br> Week |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 27 | Run | Run | TAC | TAC | U.S. Catch |
| 28 | 65,767 | 73,621 | 0 | 0 | 33,855 |
| 29 | 67,962 | 102,044 | 27,044 | 20,477 | 36,705 |
| 30 | 76,172 | 99,822 | 24,822 | 18,099 | 31,861 |
| 31 | 142,956 | 110,667 | 35,667 | 29,234 | 34,505 |
| 32 | 153,507 | 193,058 | 98,058 | 79,756 | 30,102 |
| Postseason | 168,964 | 232,348 | 157,348 | 127,305 | 63,420 |

Terminal run does not include any marine harvest of Taku River salmon that might occur outside of District 111.

During week 32, Taku Inlet and Stephens Passage were open for four days, with the opening delayed until Monday to avoid conflict with the Golden North Salmon Derby. Inriver mark-recapture estimates indicated that the PSC mandated 75,000 sockeye escapement had been realized. With adequate Speel Lake weir sockeye escapement and Crescent Lake sonar counts, the entrance to Port Snettisham (Subdistrict 111-34) was opened for four days to target returning Snettisham Hatchery sockeye salmon. Section 11C (Subdistrict 111-20) was opened for four days in conjunction with Stephens Passage due to adequate pink escapement in the area. The traditional District 111 gillnet sockeye harvest of 29,341 fish was the highest of the season, $37 \%$ above average for the week, with $66 \%$ (19,300 fish) harvested in Stephens Passage and Port Snettisham where the fleet was targeting hatchery origin sockeye salmon bound for Port Snettisham. Analysis of otoliths revealed that $47 \%$ ( 28 of 60) of the samples processed from Stephens Passage, and $91 \%$ ( 86 of 95 ) of the samples processed from Port Snettisham during this week were Snettisham hatchery origin sockeye salmon.

The week 33 traditional District 111 gillnet harvest of 15,586 sockeye salmon was $12 \%$ above average. Taku Inlet north of the latitude of Circle Point was open for the average three days to conserve for Tatsamenie sockeye salmon, but inriver indicators pointed to no concern with the overall sockeye escapement. Stephens Passage and Port Snettisham were open for four days with adequate escapements to Speel and Crescent Lakes. Section 111C was open for four days. The Speel Arm THA (Subdistrict 111-33) in Port Snettisham was initially opened for two days based on adequate escapement through the Speel Lake weir, and then extended two additional days after a surge of fish were passed through the Speel Lake weir. The early opening of the Speel Arm THA drew effort from
the traditional fishery in the district. Deliveries were made by 20 boats in Taku Inlet ( $56 \%$ of average), 3 boats in Stephens Passage ( $11 \%$ of average), 25 boats in Port Snettisham ( $90 \%$ of average), and 53 boats in the Speel Arm THA (192\% of average). In the traditional District 111 fishing areas, $1 \%$ of the 4,700 sockeye salmon harvested in Taku Inlet, $24 \%$ of the 230 sockeye salmon harvested in Stephen's Passage, and $92 \%$ of the 10,600 sockeye salmon harvested inside Port Snettisham were of Port Snettisham hatchery origin. An additional 84,700 sockeye salmon were harvested in the Speel Arm THA in week 33.

The fall gillnet season in District 111 lasted eight weeks, beginning on August 20 in week 34, and lasting until October 19 in week 42. The first ADFG inriver coho estimate produced in week 33 indicated an inriver run of 41,000 fish, above the season minimum inriver target of 38,000 coho salmon. In the first week of the fall season fishing time was set at four days in all the traditional gillnet areas to allow harvest of Taku River and local origin coho salmon and continued harvest of Snettisham hatchery sockeye salmon. The traditional District 111 sockeye harvest for week 34 of 20,300 fish (Appendix C.1) was nearly four times average for the week, with $57 \%$ of the sockeye harvest taken in Stephens Passage and Port Snettisham. An additional 22,800 sockeye salmon were harvested in the Speel Arm THA. The week 34 traditional District 111 coho harvest of 5,450 fish was three times the average and the chum harvest was 2.3 times the average. Section 111C closed for the season at the end of the week 34 fishery. Taku Inlet, Stephens Passage, and Port Snettisham were open for four days during weeks 35-37. The traditional District 111 coho harvest of 8,330 fish in week 35 was $340 \%$ of average and the harvest of 1,200 chum salmon was $185 \%$ of average. The week 36 harvest of 11,000 coho salmon was $276 \%$ of average and the harvest of 1,300 chum salmon was $187 \%$ of the average. During week 37 the traditional District 111 harvest of 14,024 coho salmon was $316 \%$ of average, and the harvest of 1,424 chum was $230 \%$ of average. The Speel Arm THA was closed for the season concurrently with the rest of District 111 at the end of the week 37 fishery. With dropping effort and no concerns for Taku River coho escapement, Taku Inlet was open continuously beginning in week 38 with Stephens Passage open four days each week to conserve local coho stocks. Both areas closed for the season in week 42 after a four day opening for the week. The week 38 traditional District 111 harvest of 10,850 coho salmon was $303 \%$ of average, and the harvest of 745 chum salmon was $257 \%$ of the average. The week 39 coho harvest of 760 fish was $38 \%$ of average, and the chum harvest was $64 \%$ of average reflecting the drop in effort. In week 38, 35 boats ( $170 \%$ of average) made deliveries, and in week 39,8 boats ( $62 \%$ of average) made deliveries. Week 40 was the last week deliveries were made in the 2006 traditional District 111 gillnet fishery. Five boats ( $64 \%$ of average) harvested 428 coho salmon ( $45 \%$ of average) and 9 chum salmon (43\% of average). Although District 111 remained open until October 19, week 42, there was no reported commercial gillnet activity in the final two weeks of the season.

Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2006. Personal use permits were used to harvest an estimated 804 Taku River sockeye salmon. In 2006, an estimated 3,150 Chinook salmon were harvested by sport fisheries in the Juneau area. A number of stocks are known to contribute to the Juneau
area sport fishery, including those from the Taku, Chilkat, and King Salmon rivers, and local hatchery stocks, but the major contributor of large, wild mature fish was believed to be the Taku River. Of the Chinook salmon harvested 2,415 were estimated to be of Taku River origin based on CWT analysis and maturity data. The July Hawk Inlet shoreline commercial purse seine pink fishery in Chatham Strait was opened 7 times from July 6 through July 27. Each opening was restricted to 8 hours. Point Marsden defined the southern boundary of these fisheries while the latitude of Hanus Reef defined the northern boundary. Although there was an abundance of north migrating pink salmon, the Hawk Inlet openings were conservative in 2006 because sockeye escapements were not developing adequately for Chilkat and Taku River stocks. The harvests for these fisheries totaled 164 Chinook, 12,600 sockeye, 2,254 coho, 340,000 pink, and 172,000 chum salmon. A large number of stocks, including the Taku River, contribute to this directed pink fishery. A purse seine test fishery was also conducted in weeks 26, 27, and 28 between Hawk Inlet and Point Retreat, with harvests totaling 24 Chinook, 727 sockeye, 114 coho, 12,551 pink, and 13,468 chum salmon.

## Canadian Fisheries

Taku River commercial fishers harvested 21,099 sockeye, 391 pink, 8,567 coho, 7,377 large Chinook (greater than 660 mm mid-eye to fork length, mostly 3-ocean or older) and 207 small Chinook salmon in 2006 (Appendix C.4-C.6). The sockeye catch was below average while the coho catch was more than twice the average. Fish originating from Taku fry plants contributed an estimated 805 fish to the catch, comprising $4 \%$ of the total sockeye harvest. The catch of large Chinook salmon was about three times the average. The increased catch was a result of the new Chinook agreement allowing directed Chinook fishing. In concert with this, catch accounting for small salmon was revised from a commercial weight-based designation (previously referred to "jacks" which were typically fish under 2.5 kg or 5 kg , depending on where they were being marketed), to a length-based designation (small Chinook salmon i.e. less than 660 mm in length from the middle of the eye to fork of tail). Hence, comparisons with catches from previous years should be noted accordingly. There were 77 days of fishing and a season effort total of 518 boat days, both above average. This increase in effort was due to the fishery commencing in late April rather than mid June, to allow directed Chinook fishing. Excluding the directed Chinook fishery, the number of days of fishing and boat days were average and $10 \%$ below average, respectively. As in recent years, both set and drift gill netting techniques were used with the majority of the catch taken in drift gillnets. Maximum allowable mesh size was increased from 15.0 cm to 20.4 cm until June 29 to facilitate harvest of Chinook salmon.

In addition to the commercial catches, 222 Chinook, 85 sockeye, and 300 coho salmon were harvested in the aboriginal fishery in 2006. The catches in the Taku aboriginal fishery have averaged 150 Chinook, 250 sockeye, and 300 coho salmon, and two steelhead.

Recreational harvest figures are not available. Anecdotal evidence suggests that Chinook fishing was poor on the Nakina River and above average on the Tatsatua River. It has
been assumed that on average approximately 300 large Chinook salmon are harvested annually. Using Nakina and Tatsatua River aerial survey data (in 2006, counts were 62\% of average) to this figure suggests that the harvest was approximately 186 large Chinook salmon. The catches of other species are believed to have been minimal.

Test fisheries to capture Chinook and coho salmon for stock assessment purposes took place from May 3 through May 27 (weeks 18-21) and September 3 through October 5 (weeks 36-40) (Appendix C.7). The test fishery caught 630 large and 9 small Chinook salmon. The coho test fishery caught 2,802 coho and 262 sockeye salmon.

The bilateral preseason Chinook forecast, based on sibling relationships, was for a terminal run of 64,150 large fish, approximately $5 \%$ above the average run of 54,582 fish. With a run of this magnitude, the AC for the Canadian fishery would have been 7,733 fish. However, given the treaty requirement to keep within weekly guidelines and use the upper end of the escapement goal range prior to the availability of an inseason estimate, the AC was 6,174 fish, with an additional base level catch of 1,500 fish for a permissible catch to 7,674 fish. Similarly, the U.S. AC would have been 7,517 fish; however given the fact that, assuming average run timing, $47 \%$ of the run had passed through District 111 prior to the first U.S. opening, the AC was 3,988 fish plus a base level catch of 3,500 for a total of 7,488 fish.

For the new Chinook fishery and, as in past years, the sockeye and coho fisheries, guideline harvests were developed each week to guide management decisions so that: a) the catch was consistent with conservation and Treaty goals; and b) management was responsive to changes in projections of abundance, i.e. abundance-based. The guidelines were based on current inseason forecasts of the Canadian AC (based on mark-recapture estimates) apportioned by historical run timing.

The commercial fishery commenced on April 30, week 18, approximately seven weeks earlier than in previous years in order to accommodate the new directed Chinook fishery. As per the agreement, the preseason forecast and the escapement target of 55,000 fish were used to calculate the AC and guide weekly management actions for the first three weeks of the season, i.e. through week 21 . Thereafter, the inseason escapement target (42,500 fish) and inseason run projections based on the joint Canada/U.S mark-recapture project were used (Table 6). Weekly guideline harvests were calculated to guide the management of the commercial fishery.

Week 18 was opened for two days closed as scheduled to keep within the weekly guideline of 209 large Chinook salmon.

Week 19 was also opened for two days. The day one hail indicated a catch of 184 fish; catches increased considerably on day 2 to give a weekly total of 461 fish, 188 fish in excess of the weekly guideline of 460 fish. The CPUE of 46 fish per boat-day (fbd) was 2 fbd higher than the maximum CPUE observed in 2005.

Table 6. Canadian inseason forecasts of terminal run size, total terminal allowable catch (TTAC), and spawning escapement of Taku Chinook salmon, 2006.

| Stat <br> Week | Terminal <br> Run | Cdn <br> TAC | Weekly <br> Guideline ${ }^{\text {b }}$ | Actual <br> Catch |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
| 18 | 64,150 | 7,750 | 4,250 | 209 | 197 |
| 19 | 64,150 | 7,750 | 4,250 | 460 | 647 |
| 20 | 64,150 | 7,750 | 4,250 | 537 | 894 |
| 21 | 64,703 | 20,803 | 9,381 | 1,485 | 862 |
| 22 | 67,759 | 23,859 | 10,196 | 1,621 | 1,135 |
| 23 | 68,024 | 24,124 | 10,459 | 1,516 | 1,125 |
| 24 | 69,474 | 25,574 | 10,701 | 1,030 | 317 |
| 25 | 65,702 | 21,802 | 9,647 | 550 | 1,237 |
| 26 | 64,237 | 20,337 | 9,257 | 321 | 564 |

${ }^{\text {a }}$ TTAC includes Canadian and U.S. base level catches but not potential test fishery catch.
${ }^{\mathrm{b}}$ Does not include anticipated Aboriginal and recreational catches.

Week 20 was opened for one day; the weekly guideline was 537 fish. The CPUE was higher, 77 fbd , than in the prior week; effort was also high (13 licenses). The catch after one day of fishing was 894 fish. Due in part to a very late spring, water levels were exceedingly low during weeks $18-20$; this contrasted with record high levels seen in 2005. The low water levels undoubtedly contributed to the high CPUE observed during these weeks.

The first inseason run size projection was made after the week 20 opening. It was estimated, based on mark-recapture data, that 10,998 fish had passed the international border, and 766 fish had been harvested in the U.S sport fishery through week 19; this total was expanded based on historical run timing at Canyon Island to make a terminal run size projection of 64,703 large Chinook salmon.

Based on this information, the weekly guideline for week 21 was 1,485 Chinook salmon. An initial opening of two days was announced. Water levels were increasing and the CPUE was down from week 20. The catch on day one was 279 fish; consequently the fishery was extended by one day. Catches increased on day two ( 395 fish) but dropped again on day three ( 188 fish). The final catch for the week was 862 fish. Water levels continued to rise throughout the remainder of the week.

A joint inseason estimate made after week 21 translated to a terminal run projection of 67,759 fish. The week 22 guideline harvest based on this was 1,621 fish; water levels were above average and catch rates were deemed likely to be similar to those observed in week 21; an initial posting of four days was made. This was extended in one-day increments to seven days. By the end of the week water levels had risen to 12.7 feet on the gauge located in the canyon downstream of the fishery, the highest spring measurement taken at that location since recording started in 1988. The final catch for the week was 1,135 fish, about 500 fish below the guideline.

Based on a joint inseason estimate made after day 3 in week 22, the terminal run projection was 68,024 fish. The weekly guideline harvest for week 23 was 1,488 fish. An opening of three days was posted but due to the extreme water levels only seven fish were caught on day one and the fishery was extended to five days. The catch through day four was less than 500 fish so the fishery was again extended, this time for the remainder of the week. The total weekly catch was 1,125 fish.

Fishing conditions continued to be poor in week 24 and a five-day opening was posted. The joint terminal run projection after day three was 65,702 fish, which translated to a weekly guideline harvest of 929 fish. At this point the catch was 86 fish, and the fishery was extended to seven days. Catches remained low with a weekly total of 317 fish.

Week 25 was opened for four days. This was officially the first week of the sockeye fishery; however it appeared that the sockeye run was delayed and Chinook considerations were in the forefront. The weekly guideline using the joint terminal run projection made after day 3 in week 22 was 499 fish. In week 25 water levels drop rapidly; by the end of the week the canyon gauge indicated 5.7 feet, which was below average. Based on this and CPUE data from Taku inlet it was assumed that fish which would normally have entered the fishery in week 24 were doing so this week. Consequently guideline harvests for weeks 24 and 25 were combined to a total of 1,427 fish. After day 3 the guideline harvest had not changed and the cumulative catch was 665 fish. The fishery was extended one day and then, based on day 4 data when the guideline increase by about 40 fish, another day to a total of six days. The final catch for the week was 1,237 fish. Addition of the previous week's catch yielded a total of 1,554 fish, which was close to the pooled biweekly guideline.

Week 26 was opened on four days due to high TAC in the sockeye guideline harvest. The final joint inseason Chinook estimate was made after day 3 and projected an escapement of 42,274 fish, just under the escapement target of 42,500 . Consequently, mesh was restricted to sockeye gear only, i.e. it was reduced from 20.4 cm ( 8 inches) to 15 cm (6 inches). The weekly catch of Chinook salmon was 564 fish. Mesh restrictions were not lifted for the remainder of the fishing season and the season total commercial harvest was 7,377 large Chinook salmon. The cumulative commercial fishery Chinook CPUE was 259 fbd, approximately 23\% higher than the cumulative CPUE observed in 2005. The CPUE ranged from a low of 13 fbd in week 18 to a high of 56 fbd in week 25.

As noted, a final joint inseason estimate of inriver run size, 48,082 fish, was made in week 26 ; this projected to 50,177 fish. Subtracting all inriver harvests, the escapement is estimated to have been 41,831 fish, just short of the target of 42,500 large Chinook salmon. The terminal run size was projected to be 64,237 large Chinook salmon, within 100 fish of the preseason forecast. The sum of the weekly guideline harvests based on the joint preseason forecast and inseason run projections was 8,190 fish; the actual harvest was 7,720 fish. This includes an estimated 222 aboriginal harvest and an assumed recreational harvest of 186 fish. The corresponding figures, i.e. the sum of weekly guideline harvests and total harvest for the U.S. were 8,535 and 12,908 respectively.

The Canadian preseason sockeye forecast was for a run of 204,070 fish. This was a drainage-wide stock-recruitment based forecast. It was $20 \%$ below the average run of 254,000 sockeye salmon (Canadian estimate). The total run incorporates an assumed U.S. harvest of $5 \%$ in marine approach waters (outside District 111); the terminal run forecast was therefore approximately 194,000 fish.

The commercial sockeye fishery commenced on June 18, week 25, for a scheduled opening of four days. The guideline harvest based on the preseason forecast was 1,249 fish (Table 7). By the close of day 3, 47 sockeye salmon had been caught; based on this and the fact that there was room in the pooled biweekly Chinook guideline as noted above, the fishery was extended in two one-day increments to six days. The total sockeye catch for the week was 127 fish.

Week 26 was opened on three days. The cumulative guideline harvest through this week based on the preseason forecast was 2,829 fish, of which 132 had been taken (five of these in the directed Chinook fishery), leaving a balance of 2,697 fish. The fishery was extended one day and harvested a total of 820 sockeye salmon.

Table 7. Canadian inseason forecasts of total run size, total allowable catch (TAC), and spawning escapement of Taku sockeye salmon, 2006.

| Stat. <br> Week | Total Run | TAC | Projected <br> Escapement | Canadian <br> TAC | Inseason <br> guideline | Actual <br> Catch |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| 25 | 204,070 | 129,070 | 75,000 | 23,233 | 1,249 | 5 |
| 26 | 204,070 | 129,070 | 75,000 | 23,233 | 2,829 | 952 |
| 27 | 135,962 | 60,962 | 72,967 | 10,973 | 2,425 | 1,892 |
| 28 | 138,581 | 63,581 | 76,743 | 11,445 | 3,828 | 2,981 |
| 29 | 124,104 | 49,104 | 64,738 | 8,839 | 4,011 | 4,742 |
| 30 | 132,894 | 57,894 | 71,255 | 10,421 | 6,044 | 6,704 |
| 31 | 187,279 | 112,279 | 115,553 | 23,321 | 16,074 | 12,758 |
| 32 | 217,534 | 142,534 | 115,417 | 28,739 | 23,101 | 12,758 |
| 33 | 252,260 | 177,260 | 145,331 | 40,973 | 36,551 | 14,981 |
| 34 | 249,076 | 174,076 | 140,037 | 39,341 | 36,948 | 17,779 |
| 35 | 244,196 | 169,196 | 135,300 | 37,515 | 36,260 | 20,350 |

The week 27 fishery opened for three days. It was assumed that the run was one week late; the preseason forecast indicated that the balance in the guideline harvest was 937 fish. The Tulsequah was in flood during the first day; therefore, the fishery was extended by one day. The CPUE after three days of fishing was 33 fbd , below the average of 94 fbd so no additional extensions were made. The weekly catch was 1,089 sockeye salmon. An inseason estimate made at the close of week 27 indicated a run of 125,000 fish assuming average run timing; significantly lower that the preseason forecast of 204,000 fish. However, there were indications that the run was late; applying a one-week lag timing increased the run projection to 226,000 fish. The cumulative harvest at this point was 1,892 sockeye salmon.

The balance in the cumulative guideline harvest for week 28 ranged from 1,089 to 7,195 fish depending on what timing was applied. Based on this, an opening of three days was posted. A mark-recapture estimate produced with day one data was only marginally greater than the week 27 estimate and consequently the run projection dropped to a range of 96,000 to 145,000 fish. The balance in the guideline harvest for the remainder of the week ranged from -940 to 592 fish and the fishery was not extended.

Week 29 was opened for two days and extended one day. The total sockeye catch for the week was 1,761 fish and the cumulative catch was 4,742 fish. The balance in the cumulative harvest ranged from -900 to 700 fish. The average CPUE for the week was 57 fbd compared to an average of 98 fbd .

Week 30 was opened for two days and extended one day. As the fishery began catches in the Canyon Island fishwheel indicated a strong pulse of fish into the river. The run projections after day three ranged from 136,000 to 174,000 fish and the guideline harvest balance ranged from -362 to of 1,341 fish.

Week 31 was opened for two days due to the limited guideline harvest balance and the fact that this was the first week for which special consideration for the Tatsamenie stock was identified in the preseason management plan. However fishery CPUE had increased significantly from the previous week. The U.S. manager was consulted after day one and it was agreed that the run did appear to be late and that an extension was justified. Consequently an extension of two days was posted. A run assessment made after day 3, assuming one-week late timing, resulted in a run projection of 238,000 fish and a guideline harvest balance of 13,355 fish; however this dropped after day 4 due to a late influx of recovered tags. The fishery was extended another day; the final catch for the week was 6,054 fish. Fishery CPUE went from below average in week 30 to above average in week 31 .

Week 32 was again opened for two days due to Tatsamenie considerations. Despite favorable fishing conditions, (below average and stable water levels) CPUE after day 1 was 97 fbd , compared to an average of 113 fbd . Canyon Island fishwheel counts were average for the four previous days and on Monday morning caught only 40 fish. Consequently the fishery closed as scheduled.

Week 33 was opened for three days. It was extended another day based on day one data with a guideline balance ranging from 9,000 to 12,000 fish, below average effort (four licenses), and high catch ( 115 fbd versus weekly average of 67 fbd ) as well as high Canyon Island fishwheel catch (102 versus average of 31). It was again extend to total five days. The weekly catch was 2,791 sockeye salmon with limited effort (three licenses on day 5).

Week 34 marked the beginning of coho season. The preseason forecast was for an average run based on catches in the 2005 smolt CWT program. Assuming that U.S. exploitation rates on coho salmon would be similar to average, it was estimated that border escapement would be close to 100,000 fish, which meant that the Canadian AC
was 10,000 fish. Early indications were that the coho run was strong (for example the cumulative fishery CPUE was 179 fbd through week 33 versus an average of 66 fbd ), and this information coupled with the significant shortfall in the sockeye guideline was used to post the opening for five days. Fishery performance was strong - CPUE for both sockeye and coho salmon was record (121 and 122 fbd respectively). However, effort was low (four licenses) and the catch for each species was approximately 2,600 fish.

An opening of five days was posted for week 35 based on an inseason run projection of close to 200,000 fish. This proved to be the last week of significant commercial activity. A Tulsequah flood began mid-week and effort dwindled to two licenses by the end of the week. Weekly landings were 1,038 coho and 743 sockeye salmon.

The commercial fishery was then opened from the beginning of week 36 (starting September 3) through to week 40 October 6. A total of 26 coho salmon were landed in this period.

In order to continue coho run assessment, a test fishery operated from September 4 through October 5. This fishery landed 262 sockeye and 2,802 coho salmon.

The total treaty catch of coho in the commercial fishery was 3,610 fish. The final inseason abundance estimate of the inriver coho run is 173,906 fish. Accordingly, as per PST provisions, the Canadian allowable catch after week 33 was 10,000 salmon.

A final inseason mark-recapture estimate was produced in week 34 for sockeye salmon, indicating a border escapement of 151,867 fish. This projected to 160,110 fish assuming average timing. Subtracting the inriver harvest of 21,093 indicated that 139,017 sockeye salmon escaped to spawning areas. This is above the escapement goal of 71,000 to 80,000 fish. The cumulative commercial fishery sockeye CPUE for the season was 739 fbd, below the average of 895 . As noted CPUE was well below average through week 30; from week 31 through the end of the fishery it was average to above average. Peak CPUE was observed in week 32, but the week 33 and week 34 CPUE were very similar to this, indicating that the run was significantly later than usual. Typically peak sockeye CPUE occurs in week 31.

A final inseason coho mark-recapture estimate produced at the end of week 38 indicated that 134,271 fish had reached the border. Based on average run timing, this projected to 173,906 fish. Subtracting the inriver harvest of 12,275 coho salmon indicates that 161,631 fish escaped to spawning areas. This is more than four times the upper end of the escapement goal range of 27,500 to 35,000 fish. The cumulative commercial coho CPUE through week 41 was 362 fbd, 20\% above the average of 303 fbd . The truncated nature of the 2006 fishery precludes fishery timing comparisons with other years.

## Escapement

## Sockeye Salmon

The above border run of sockeye salmon in the Taku River is estimated from a joint Canada/U.S. mark-recapture program, in place since 1984. Enumeration weirs operated by DFO at Little Trapper and Tatsamenie lakes and by the TRTFN at Kuthai and King Salmon Lakes provide information on the distribution and abundance of discrete spawning stocks within the watershed. The estimated spawning escapement in 2006 was 146,151 sockeye salmon, which is above average and above the escapement goal range of 71,000 to 80,000 sockeye salmon (Appendix C.9).

The Tatsamenie Lake weir count of 22,475 sockeye salmon (Appendix C.9) was the second highest on record since the inception of the project (1985), 100 fish less than 2001, the primary parent year. Based on weekly sampling results, $43 \%$ of the run was comprised of females. Fifty percent of the escapement was counted on September 7, four days later than average, and unlike the primary parent year when $50 \%$ of the escapement passed the weir on August 20. A total of 2,655 sockeye salmon were held for gamete collection for the fry-planting program. An escapement of 2,491 Taku sockeye salmon originating from the fry-planting program was estimated by sampling broodstock otoliths at Tatsamenie Lake and applying the mark fraction to the weir count.

The Little Trapper Lake weir count of 25,670 sockeye salmon (Appendix C.10) was also the second highest on record since the project began in 1983. A total of 708 fish were removed for gamete collection for the fry-planting program, resulting in a spawning escapement of 24,962 fish. The primary parent year, 2001, the escapement was 16,860 fish. The 2006 sex composition was estimated at $51 \%$ female. Run timing was about three days later than average, with the mid-point occurring on August 10, the same as the primary parent year.

A King Salmon Lake escapement project was conducted for the fourth season; 2,177 fish were enumerated through a weir (Appendix C.11). Count in the other years were 697 (incomplete; 2,970 fish were observed during a boat-based survey), 5,005 and 1,002. Run timing has been variable to date; in 2006, the mid-point was on July 28. The 2006 escapement was estimated to be comprised of $50 \%$ female sockeye salmon.

The sockeye count through the Kuthai Lake weir was 1,015 fish (Appendix C.12), the lowest on record since the project began in 1992 (Appendix D.10). The primary brood year escapement was 1,663 fish. The sex composition was estimated to be $49 \%$ female fish in 2006. As was the case in 2005, the mid-point of the run was on August 8, about two weeks later than average; we speculate that high water levels may have significantly delayed the migration.

## Chinook Salmon

The above border run of Chinook salmon in the Taku River was estimated from a joint Canada/U.S. mark-recapture program. Tag application occurred April 25 through mid-

July. Tags were recovered from the commercial fishery from April 30 through October 8 (weeks 18-40), a test fishery during commercial fishery closures from May 3 to May 27 (weeks 18-21), and spawning ground sampling in August and September. The above border run estimate is 50,667 fish with a spawning escapement of 42,262 fish and a total run of 63,598 large Chinook salmon. The estimate for the total Chinook salmon above border run is 52,798 fish with an escapement of 44,692 fish and a total run of 66,371 total Chinook salmon.

Aerial surveys of large Chinook salmon to the six escapement index areas annually surveyed by ADF\&G were as follows: Nakina, 1,900; Kowatua, 1,180; Tatsamenie, 908; Dudidontu, 395; Tseta, 199; and Nahlin, 955 fish (Appendix D.11). The total survey of 5,537 large Chinook salmon observed was below the average.

Chinook carcass weirs were operated on the Nakina and Tatsatua Rivers in order to obtain tag and age-length-sex data (Appendix C.13). Totals of 1,223 and 568 large Chinook salmon were encountered. The count at the Tatsatua River carcass weir was compromised by high water levels.

## Coho Salmon

The above border run of coho salmon in the Taku River was estimated from a joint Canada/U.S. mark-recapture program. Tag application occurred through October 3; recovery occurred through October 5. Ratios of marked vs. unmarked fish are estimated for the commercial and test gillnet fisheries. The above border run of Taku River coho salmon was estimated to be 134,053 fish with a spawning escapement of 122,384 fish and a total run of 231,876 fish. The spawning escapement was above average and 3.5 times the upper end of the interim escapement goal range ( 27,500 to 35,000 fish).

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels provide an index of annual variation in border escapement. An $n$ above average total of 21,725 pink salmon was captured the fish wheels in 2006.

## Chum Salmon

As with pink salmon, the Canyon Island fish wheels are used to estimate annual variations in above border escapement. An above average total of 466 chum salmon was captured in the wheels in 2006. The Taku River fall chum run has been depressed since 1988; however this year's counts were the highest since 1997.

## Steelhead Trout

There was no program in place to estimate the system-wide steelhead trout escapement. An escapement goal has not been set for this species. A below average total of 47 steelhead trout were caught and released at Canyon Island in 2006.

## Sockeye Salmon Run Reconstruction

An estimated 62,813 wild Taku River sockeye salmon were caught in the Alaska District 111 fishery. An additional 777 wild sockeye salmon were estimated to have been taken in the U.S. inriver personal use fishery. The estimated total U.S. harvest of wild Taku sockeye salmon is 63,590 (Table 4).

An estimated 20,294 wild sockeye salmon were harvested in the Canadian commercial fishery. An estimated 82 wild sockeye salmon were taken in the Canadian aboriginal fishery. Therefore, the estimated Canadian treaty harvest of wild Taku River sockeye salmon is 21,184 fish (Table 4). An additional estimated 262 wild sockeye salmon were harvested in test fisheries.

The contribution of Taku sockeye salmon from the fry-planting program was estimated based on expansion of otolith marked sockeye salmon recovered in the sampled catch. Estimates are 2,210 to the District 111 fishery, 31 to the inriver personal use fishery, 805 to the Canadian commercial fishery, and 3 to the Canadian aboriginal fishery (Table 4). The inriver test fishery caught an additional 10 sockeye salmon from the fry-planting program.

The 2006 above border run and escapement were estimated to be 167,597 (95\% CI = $136,116-197,099$ ) and 146,151 sockeye salmon, respectively and the total run was estimated to be 233,424 sockeye salmon. The US and Canada harvested $41.6 \%$ and $13.4 \%$ of the TAC, respectively. The total run Taku sockeye salmon from the fryplanting program was estimated at 5,550 fish (Table 4).

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas.

## Harvest Regulations \& Management Objectives

Although catch sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV does call for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook, sockeye and coho salmon. Interim escapement goal ranges for Alsek River sockeye and coho salmon were initially set by the TTC at 33,000 to 58,000 sockeye, and 5,400 to 25,000 coho salmon. The principle escapement monitoring tool for Chinook, sockeye, and coho stocks on the Alsek River is the Klukshu weir, operated by DFO and the Champagne-Aishihik First Nation (CAFN). The weir has been in operation since 1976. To make the management objectives of Chinook and sockeye salmon better defined in terms of Klukshu stocks, revised goals, expressed in terms of Klukshu stocks only, were established in 1999 and adopted again in 2004. Mark-recapture programs to estimate the total inriver abundance and the fraction of the escapement contributed by the Klukshu stocks were in operation since 1997 for Chinook salmon and since 2000 for sockeye salmon. These however were discontinued in 2006.

The initiative to establish a specific Klukshu Chinook salmon spawning goal began in 1991 when the TTC set an interim spawning objective of 4,700 Klukshu Chinook salmon. This goal was based more on manager's intuition than on science. From 1995 through 1997, the TTC reviewed this escapement level and concluded that goal of 4,700 Chinook salmon was not supported by the data. A new goal range of 1,100 to 2,300 fish was proposed based on joint analyses of stock-recruitment data. The Parties conducted independent internal reviews of these analyses. Although there was not unanimous support for the proposal, there was agreement on establishing a minimum goal consistent with the lower end of the proposed range. As a result, Canadian and U.S. managers agreed to a minimum spawning escapement goal of 1,100 Chinook salmon for the Klukshu system for 2000 and this was used again in the 2006 season.

The stock-recruitment analysis of Klukshu sockeye data was completed in 2000 and has undergone internal peer review. The new escapement goal range for Klukshu River sockeye salmon is 7,500 to 15,000 spawners per year.

## Preseason Forecasts

The overall sockeye run to the Klukshu River in 2006 was expected to be slightly below average in strength. Principal contributing brood years to the 2006 run were expected to be 2001 (Klukshu escapement of 9,329 fish) and 2002 (Klukshu escapement of 23,587 fish); the 1996-2005 average Klukshu escapement was 12,522 fish. Based on historical stock-recruitment analysis, the range of Klukshu escapements that appear most likely to produce maximum sustained yields is 7,500 to 15,000 sockeye salmon.

The 2006 overall Alsek River sockeye run was expected to be approximately 66,728 fish. This estimate was based on: a predicted run of 18,016 Klukshu sockeye salmon derived from the average of the historical Klukshu stock-recruitment data and an assumed

Klukshu contribution of $27 \%$ (based on the 2001-2003 sockeye radio tagging study). A run size of this magnitude is near the 1996-2005 average run size estimate of approximately 61,800 fish (based on the Klukshu weir count expanded by $1 / 0.27$ to account for other inriver escapement and an assumed U.S. harvest rate of 20\%).

The contributing Klukshu early sockeye run counts in 2001 and 2002 were 908 and 11,904, respectively (Appendix E.7). The principal brood year (2001) was well below the optimum level of 2,500 sockeye spawners as determined through separate stockrecruitment analyses by DFO of the early run. Due to the under escapement in 2001, the early run was expected to be below average.

The Klukshu Chinook escapements in 2000 and 2001 were 1,321 and 1,738 fish, respectively. The 2000 escapement was well below average and 2001 was close to average (Appendix E.7). The escapements for 2000 and 2001 were near the lower end and the upper middle end of the optimum escapement range of 1,100 to 2,300 Chinook salmon estimated from current stock-recruitment analysis. As a result, the preliminary outlook was for an above average run. The 2006 overall Alsek River Chinook run was expected to be approximately 16,894 Chinook salmon. This estimate was based on: a predicted run of 3,072 Klukshu Chinook salmon derived from the historical Klukshu stock-recruitment data; and an assumed Klukshu contribution to the total run of approximately $17 \%$.

The coho escapements observed at the Klukshu River in 2002 (9,921 coho salmon) and 2003 ( 3,689 coho salmon) suggests the run in 2006 would be above average (Appendix E.7). The 1996-2005 average weir count was 2,889 coho salmon.

## U.S. Fisheries

The Dry Bay commercial set-gillnet fishery harvested 530 Chinook, 9,842 sockeye, and 701 coho salmon (Appendix E.1). Minor numbers of pink and chum salmon were harvested. A test fishery was conducted on the Alsek River for Chinook salmon in 2006, and that fishery produced another 224 sockeye and 135 Chinook salmon, for a total harvest of 10,066 sockeye and 665 Chinook salmon. The Chinook harvest was near the 1996-2005 average, the sockeye harvest was below average and the second lowest harvest since 1988, and the coho harvest was below average. Very little effort was recorded during the coho season due to market conditions and the coho harvest was the lowest in the last 10 years. The number of fishing days was 45 . The total effort expended in the fishery was 248 boat-days.

The Alsek River commercial fishery opened on the first Sunday in June, week 23 (Appendix E.1). The initial opening remained at 24 hours. The fishery was extended to 72 hours during week 24 as initial sockeye CPUE was almost triple the average. The opening for week 25 remained at 24 hours. Fishing time was extended to 48 hours for the last week of June and the first week of July before returning to one 24-hour period for the next two weeks of the season. Effort in the Alsek River became minimal from this point
on. The fishery targeted coho salmon after mid-August and fishing times remained at three days per week for the entire coho season. Although the Alsek River remained open through the first three weeks of October, no effort was recorded after September 30.

Historically, a set gillnet fishery targeting on Chinook salmon was conducted during May and early-June. Due to depressed runs, the directed fishery has been closed since 1963 and Chinook salmon have only been harvested incidentally during the sockeye fishery in early June. From 1963 through 1997, the early June periods were limited in time in order to reduce the impact on Chinook salmon. With the advent of the new Chinook salmon escapement goal concern for incidentally caught Chinook salmon has diminished, therefore the management of the early June periods was based on sockeye CPUE. Gillnet mesh size was restricted to a maximum of six inches through July 1.

The Transboundary River Panel agreed to a limited Chinook test fishery in the lower Alsek River beginning in 2005 and continuing through 2008. The goal of the test fishery is to enable the department to develop a cost effective method for determining the abundance of Chinook salmon on an inseason basis using test fishery CPUE as an index of abundance. The test fishery commenced on May 28 and continued on a weekly basis through June 18. A total of 135 Chinook salmon were harvested in the test fishery. All fish were sampled for age, size, and sex. A total of 224 sockeye salmon were harvested incidentally to the Chinook harvest during the test fishery.

## Canadian Fisheries

The aboriginal fishery harvested an estimated 0 Chinook, 1,321 sockeye, and 0 coho salmon (Appendix E.2). The average Chinook catch was 220 fish. The sockeye catch was above the average of 1,321 fish; while the coho catch averages 28 fish.

Catch estimates for the Tatshenshini recreational fishery were below average for Chinook and sockeye salmon with an estimated 17 and 7 fish retained, respectively, with no catches recorded for coho salmon. Due to the concern that the Klukshu River Chinook escapement goal would not be met, the recreational fishery was no longer permitted to retain Chinook salmon starting on the $20^{\text {th }}$ of July. This closure remained in effect until the $30^{\text {th }}$ of November. Retention of sockeye salmon in the Tatshenshini River was permitted starting on August $15^{\text {th }}$ as per regulation. The catch data was derived from a catch card program conducted by the Yukon Salmon Committee (YSC) and DFO. Weekly estimates are listed in Appendix E.2.

Management of salmon in the Yukon is a shared responsibility between DFO and the Yukon Salmon Committee (YSC). The YSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the YSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so
that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

The 2006 Alsek-Tatshenshini management plan, adopted by CAFN, YSC, and DFO, was based on the objectives described in the Harvest Regulations \& Management Objectives section above. For Chinook and early run sockeye management, the status of the Klukshu weir counts was to be reviewed on or about July 18 to ensure weir and spawning escapement targets were on track. The status of the late run sockeye salmon would be reviewed the first week of September. Adjustments to inseason fishing regimes in the recreational and aboriginal fisheries would be made if deemed necessary. Other key elements of the plan are described below.

The center of aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff and traditional fish traps as the fish migrate up the Klukshu River into Klukshu Lake. The fishing plan for the aboriginal fishery in the Klukshu River for the period prior to August 15 allowed fishing by means of fish traps for 2 days per week. After August 15, it was planned that the traps would be fished 3 days per week. Conservation thresholds that might invoke restrictions in the Aboriginal fishery were projected Klukshu weir counts of $<1,100$ Chinook and $<1,500$ early sockeye salmon. Gaff fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The plan did not restrict the gaff fishery other than to reserve Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the recreational fishing effort on this drainage occurs on the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 unless the weir count projection for the early run was $>4,500$ sockeye salmon. The Chinook daily catch limit was one fish and the possession limit was 2 Chinook salmon. For other salmon species, the daily catch and possession limits were 2, and 4 fish, respectively. However, the aggregate limit for all salmon combined was 2 salmon per day, 4 fish in possession. Starting in 2003, recreational salmon fishing was permitted in the Tatshenshini River seven days a week; this fishery had previously been open from 6:00 am Saturday to 12:00 noon Tuesday each week. Headwater areas upstream of the British Columbia/Yukon border were to be closed for the season to protect spawning Chinook salmon. Conservation thresholds that were expected to invoke additional restrictions in the recreational fishery were projected Klukshu weir counts of <1,500 Chinook and < 10,600 sockeye salmon (early and late runs combined).

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the YSC in 1999, was required by all recreational salmon fishers in 2006. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon recreational fishery. Anglers are required to report
their catch via mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River Bridge crossing up to the new weir location to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini confluence.

## Escapement

Total drainage abundance programs were implemented as part of the development of abundance-based management regimes and to accurately assess whether the system-wide escapement goals for Alsek River Chinook and sockeye stocks are appropriate and if so, are being achieved. At this time, there are no programs in place to estimate the drainagewide coho escapement. A large and variable proportion of the escapement of each species is enumerated at the weir on the Klukshu River. Current escapement monitoring programs including the Klukshu weir, Village Creek electronic counter, and aerial surveys allow annual comparisons of escapement indices. The most reliable long term comparative escapement index for Alsek River drainage salmon stocks is the Klukshu River weir count. Escapements for 2006 are shown in Table 8.

## Sockeye Salmon

The weir count and escapement estimates of Klukshu River sockeye salmon were 13,455 and 12,890 fish respectively in 2006 (Table 8, Appendices E. 3 and E.7). The count of 247 early run fish (count through August 15) was below average while the count of 13,208 late run fish was above average. The total escapement $(12,890)$ was above average, and was near the upper end of the recommended escapement goal range of 7,500 to 15,000 fish. The sockeye escapement estimate at the Village Creek counter of 979 fish in 2006 was below average.

## Chinook Salmon

The most reliable comparative Chinook escapement index for the Alsek River drainage is the Klukshu River weir count. The Chinook weir and escapement counts in 2006 were 568 and 566 fish respectively (Table 8), below average. They were the lowest on record, and the escapement was below the revised interim escapement goal range of 1,100 to 2,300 Klukshu Chinook salmon.

## Coho Salmon

The Klukshu weir count and escapement of 420 fish was below average (Table 8, Appendix E.7). The weir is removed prior to the completion of the coho run and does not include fish that migrate after mid-October.

Table 8. Catch and Klukshu index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2006.

|  | Sockeye | Chinook | Coho |
| :--- | ---: | ---: | ---: |
| Escapement Index $^{\text {a }}$ |  |  |  |
| Klukshu Weir Count | 13,455 | 568 | 420 |
| Klukshu Escapement | 12,890 | 566 | 420 |
|  |  |  |  |
| Harvest $^{\text {b }}$ |  |  |  |
| U.S. Commercial | 9,842 | 530 | 701 |
| U.S. Subsistence | 272 | 47 | 23 |
| U.S. Test | 224 | 135 | 0 |
| Canadian Sport | 7 | 17 | 0 |
| Canadian Aboriginal | 1,321 | 0 | 0 |
| Total Harvest | 11,666 | 729 | 724 |
| a Klukshu River |  |  |  |

${ }^{\text {a }}$ Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
${ }^{\mathrm{b}}$ U.S. harvest estimate differs from Joint Interception committee estimate because no estimates are made for catches other than the listed fisheries.

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2006, sockeye eggs were collected at Tahltan Lake on the Stikine River for the nineteenth year, and in the Tatsamenie Lake system on the Taku River, for the seventeenth year of this program.

## Tahltan Lake

The egg collection was contracted to Arc Environmental Ltd. for the eleventh consecutive year. The egg-take goal at Tahltan Lake is 6.0 million eggs. In spite of the large escapement at Tahltan only 4.4 million eggs were collected. Some of the explanation for the reduced egg take was a late start because of concerns about future potential to harvest fish at the Tuya barrier and bad weather at end of egg take schedule. Brood stock was collected by beach seine at the major spawning site as has been done in most years. There were 11 egg collections from September 11 to 27. Brood stock included 1,740 females and 1,663 males, which included 108 fish not utilized for gamete collection. Eggs collected on three days were delayed in shipment to the hatchery due to weather; all of those shipments were delayed 48 hours. The early indications are that these eggs survived much better than prior years; we believe this was due to the new procedure for holding delayed shipments (chilling and holding in a moist air environment). The survival rate to eyed for the delayed shipments was $86 \%$ (vs. $70 \%$ in 2005) while for direct shipment it was $94 \%$.

## Tatsamenie Lake

B. Mercer and Associates Ltd was contracted to collect eggs. Tatsamenie Lake brood stock was captured for the twelfth year at an adult enumeration weir located at the outlet of Tatsamenie Lake. A total of 1,455 females and 1,200 males were held prior to the first egg take on September 20. An estimated 5,000,000 eggs were collected from 1,220 females and milt was collected from 962 males during 10 egg collections. Mortality of held fish included 37 females and 118 males; the remaining 198 females and 120 males not used for gamete collection were released. The 1,257 females used for brood stock represented $10.6 \%$ of the estimated escapement of females in to the lake.

## Trapper Lake

For the first time in twelve years eggs were collected at Trapper Lake in 2006. This project was operated with Northern Fund monies but will be reported in TBR reports. A total of 398 females and 310 males were held prior to the first egg take on September 9. An estimated 1,100,000 eggs were collected from 336 females and milt was collected from 295 males during 3 egg collections. Mortality of held fish included 2 females and 4 males; the remaining 60 females and 11 males not used for gamete collection were released.

## Incubation, Thermal Marking, and Fry Plants (2003 Brood Year)

The egg incubation and thermal marking program at Snettisham Hatchery went smoothly in year 2005/2006. Snettisham hatchery is operated by DIPAC (Douglas Island Pink and Chum, Inc.), a private aquaculture organization in Juneau. A co-operative agreement between ADF\&G and DIPAC provides for Snettisham hatchery to serve the needs of the joint TBR enhancement projects.

Incubation of 2005 brood eggs took place at Snettisham Hatchery and the resultant fry were transported to the appropriate systems from June 1 to June 23, 2006. There were no IHN virus losses of sockeye fry from transboundary lakes.

## Tahltan Lake

A total of 1.28 million fry from the 2005 Tahltan sockeye egg take was planted back into Tahltan Lake in 2006. Survival from green-egg to outplanted fry was $71 \%$ (this low survival is because shipment of collected eggs was delayed due to weather). Fry outplanting took place from June 2 to June 7.

## Tuya Lake

There were 2.14 million fry planted in Tuya Lake from June 19 to June 23 (Appendix D.2). These fish were from eggs collected at Tahltan Lake in the fall of 2005. Survival from green-egg to outplanted fry was $78 \%$ (this low survival is because shipment of collected eggs was delayed due to weather).

## Tatsamenie Lake

A total of 1.47 million fry from the 2005 egg-take was released into Tatsamenie Lake in 2006. There were two treatment groups: one group was released at the North end and one at the South end of the lake; outplanting took place from June 1 to June 8. Neither group was fed, however the fry were held for observation before release. Survival from greenegg to outplanted-fry was $81 \%$.

The strategy behind releasing at two locations is to put some fry in an area with little natural production. The south end of the lake traditionally has few fry along the shore. Past studies have indicated a protracted shore residence for hatchery and wild fry and we hope that fry release at the South end will enjoy less competition and better survival.

## Outplant Evaluation Surveys

Standard limnological surveys were conducted at Tatsamenie, Tahltan, and Tuya Lakes. Acoustical surveys were not conducted due to the failure of the equipment.

## Thermal Mark Laboratories

## ADF \&G Thermal Mark Laboratory

During the 2006 season the ADFG thermal mark lab received otoliths from 17,500 sockeye salmon collected by ADFG and DFO staff as part of the U.S./Canada fryplanting evaluation program. These collections came from commercial and test fisheries in U.S. waters and in Canadian fisheries on the Taku and Stikine Rivers over a 12-week period. In addition, several escapement samples were examined. Combined, the laboratory processed 16,800 of the otoliths received (99\%) and provided estimates on hatchery contributions for almost 100 distinct sampling collections. Of these totals, 3,900 otoliths were identified and classified as belonging to one of 37 marked groups. Estimates of the percentage of hatchery fish contributed to commercial fishery catches were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.

Adult sockeye otoliths were processed inseason by the ADF\&G otolith lab to estimate the weekly contribution of planted sockeye salmon to the District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku Rivers. Contributions of planted sockeye stocks to catches were as follows: 30,784 planted Tahltan and 10,122 planted Tuya fish to District 106 and 108 (includes inriver subsistence fishery), and 2,241 planted Tatsamenie fish to District 111 (includes inriver personal use fishery). Estimates of contributions to Canadian fisheries included 42,053 planted Tahltan and 17,816 planted Tuya fish to Stikine River fisheries and 808 planted Taku River fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Sub-samples of juvenile and adult otolith samples collected at the study lakes during the 2006 season are being analyzed at the DFO thermal mark lab in Whitehorse.

## APPENDICES

Appendix A. 1. Weekly salmon catch in the Alaskan District 106 commercial drift gillnet fisheries, 2006.

| Week | Start <br> Date | Catch |  |  |  |  |  | Effort |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{\text {a }}$ Tahltan includes wild and thermally marked fish.
${ }^{\mathrm{b}}$ Catch and effort data used to generate cpue by stock group excluded the 10,373 catch and effort above Porcupine.
${ }^{\text {c }}$ because the commercial fishing activity concluded before the run terminated, egg diameters from the test fishery and a proxy cpue was used based on a regression of District 108 cpue of Stikine fish vs inriver cpue with intercept forced to zero.

Appendix B. 1. Salmon catch and effort in the Alaskan District 106 commercial drift gillnet fisheries, 1960-2006.
Effort may be less than the sum of effort from 106-41/42 and 106-30 since some boats fished in more than one subdistrictt.

[^5]Appendix B. 7. Salmon catch and effort in the Alaskan District 108 commercial drift gillnet fishery, 19602006.

Permit days are adjusted for boats which did not fish the entire opening and may total less than the sum of the permits times days open.

${ }^{\text {a }}$ Average proportions were from averages of weekly estimates.

Appendix B. 23. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye stocks, 1979-2006.
Stock compositions based on: scale circuli counts 1979-1983; SPA in 1985; average of SPA and GPA 1986-1988; and egg diameter analysis in 1989-2006. 1994-2000 and 2003-2004 data from commercial catch. Estimates for 2001-2003 are from the test fishery and from 2004-2006 from the commercial fishery.

${ }^{\text {c }}$ Large Chinook are fish with mid-eye-to-fork-of-tail (MEF) length > 659 mm (mostly 3-5 ocean age fish).
${ }^{\text {b }}$ Prior to 2005, chinook catch was broken down into jacks and adults; therefore only total catch of chinook should be used for comparison purposes.

Appendix D. 4. Salmon catch in the U.S. subsistence and personal use fisheries in the Taku River, 19672006.

The subsistence fishery was open 1967 to 1976 and 1985 and the personal use fishery was open 1989-2006. The harvests are miminum estimates because not all permits are filled out and returned.

${ }^{2}$ Mark-recapture estimates for Crescent 91, 92 Speel 95
${ }^{\mathrm{b}}$ Weir count plus spawning ground survey. Trapper $83,85,87$
${ }^{\text {c }}$ Weir counts are incomplete. Kuthai 92, Nahlin 88, 92
${ }^{\text {d }}$ Counts may be low due to uncounted fish passage past weir. Crescent 88-90, Speel 90, Kuthai 93
${ }^{e}$ In 1995 the weir was moved upstream to Tatsamenie Lake, the count of 8,000 is an expansion (based on past experiance) of the 5,780 fish counted there.
${ }^{\mathrm{f}}$ The estimated return of 10,381 through the Tatsamenie Lake weir in 1996 is thought to represent approximately $80 \%$ of the sockeye run past the old weir location at Little Tatsamenie Lake. This results in a potential run of 12,976 sockeye salmon.
${ }^{8}$ The estimated return of 8,363 through the Tatsamenie Lake weir in 1997 is thought to represent approximately $80 \%$ of the sockeye run past the old weir location at L . Tatsamenie Lake resulting in a potential run of 10,454 sockeye.
${ }^{\text {h }}$ The estimated count of 5,997 fish through Tatsamenie Lake weir in 1998 does not include an estimated 1,499 fish spawning in the outlet stream i.e. total estimate 7,496 .
${ }^{i}$ Minimum estimates of run size
${ }^{j}$ In 2002 the Trapper weir count was expanded by $69 \%$ migratory timing to account for fish passage during high water and the Kuthai weir count had 102 fish removed for an aboriginal food fishery.

${ }^{\text {a }}$ In years when sample size data is available (1999-present in the commercial and test fisheries, and 2003-2004 in the Aboriginal fishery) it was used to determine the number of large fish in the Canadian harvest. In years when sample data is not available, the average \% large in the commercial fishery from 1999-2004 (75\%) was applied to all catches except the recreational catch, which is assumed to be $100 \%$ large and comprise 300 fish annually.
${ }^{\mathrm{b}}$ U.S. catch includes D111 commercial gillnet and Juneau area sport fishery harvests; the estimate of large fish for the commercial fishery includes age-1.3 and older fish; all sport harvests are assumed to be large fish.

Appendix D. 14. Escapement counts of Taku River coho salmon, 1984-2006.
Counts are for age-. 1 fish and do not include jacks. Because of variability between methods, visibility, observers, and timing, these counts are not an index of run strength.

${ }^{\text {a }}$ Counts include jack chinook salmon.
${ }^{\mathrm{b}}$ Weir was removed prior to the end of the coho run.
${ }^{c}$ The chinook and sockeye escapements into Klukshu Lake are calculated from the weir count minus fish harvested above the weir site minus brood stock taken. The remainder of the food fishery harvest occurred below the weir, at Village Creek, and Blanchard and Takhanne Rivers.
${ }^{\mathrm{d}}$ Includes sockeye counts up to and including August 15.

Appendix E. 8. Alsek River sockeye salmon escapement 2000 to 2004. Estimates are based on a markrecapture study which was discontinued in 2005.

[^15]
[^0]:    ${ }^{\text {a }}$ Data not available to estimate contributions of pink salmon from Alaska hatcheries.

[^1]:    ${ }^{\text {a }}$ All Tahltan includes wild and thermally marked fish.

[^2]:    ${ }^{\mathrm{a}}$ Tahltan includes wild and thermally marked fish.

[^3]:    ${ }^{\text {a }}$ Jacks as reported by fishery and loosely based on "small" fish $\sim 2.5-3.0 \mathrm{~kg}$; the jack catch may not correspond with the estimated jack catch based on samplin, I.e. jack $<660$ mef or $<735 \mathrm{fl}$.
    ${ }^{\mathrm{b}}$ Estimated season catch (spring and autumn) is 75-100 fish.
    ${ }^{\text {c }}$ Weekly catches and effort were estimated to represent $75 \%$ of the catch. The catch was expanded to account for this estimate, which was based on the fact that the sport fishery was only monitored five days per week and that the, presumably minor, Iskut sport fishery was not monitored

[^4]:    ${ }^{\text {a }}$ Tahltan includes wild and thermally marked fish.
    ${ }^{\mathrm{b}}$ Used the proportion observed in stat wk 27 as a proxy for stat weeks 25-26

[^5]:    ${ }^{\text {a }}$ Tahltan includes wild and thermally marked fish.

[^6]:    ${ }^{\text {a }}$ All Tahltan includes thermally marked fish.

[^7]:    ${ }^{\text {a }}$ All Tahltan includes thermally marked fish.

[^8]:    ${ }^{\text {a }}$ There was no commercial fishery in 1984.

[^9]:    ${ }^{\mathrm{a}}$ Average proportions were from averages of weekly stock composition and migratory timing (from drift test fishery) estimates.

[^10]:    ${ }^{\text {a }}$ Chum Salmon are not included because of the difficulty of making an accurate estimate, the majority of the summer chum catch was of hatchery origin.

[^11]:    ${ }^{\text {a }}$ There was no test fishing during statistical weeks 18-35 inclusive.
    ${ }^{\mathrm{b}}$ Large Chinook are fish with mid-eye-to-fork-of-tail (MEF) length $>659 \mathrm{~mm}$ (mostly 3-5 ocean age fish).

[^12]:    ${ }^{\text {a }}$ Aboriginal catch by week is not available

[^13]:    ${ }^{\text {a }}$ The Trapper and Mainstem groups were combined in the 1989 analysis and were 45,573 fish

[^14]:    ${ }^{\text {a }}$ Weir count combined with spawning ground count. Tatsamenie 88-90, Yehring 86-87, Nahlin 92.
    ${ }^{\mathrm{b}}$ Incomplete weir count. Tatsamenie 85-87, 93, 95, 96; and Nahlin 92
    ${ }^{c}$ Count is an average of surveys by different observers. Flannigan $86,87,88,90,91$;sockeye $86,87,88,90,91$;Fish $86,88,90,91$; Yehring 87, 88, 91, 92
    ${ }^{\mathrm{d}}$ Includes mark-recapture estimate. Yehring 89, 90
    ${ }^{\mathrm{e}}$ Poor survey conditions. Nahlin 91.
    ${ }^{\mathrm{f}}$ Foot survey. Yehring 92, Sockeye 92
    ${ }^{\mathrm{g}}$ Surveys conducted before peak abundance on spawning grounds Flannigan 93, 94

[^15]:    ${ }^{a}$ Eggs not transported but placed in inlake incubator; $2000=244,000,2001=865,000,2002196,000,2003=190,000$.
    ${ }^{\mathrm{b}}$ Survival rates are for hatchery eggs and hatchery fry plants and do not inlcude the lake incubators.
