## LIST OF TABLES

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, and troll fisheries and the inriver test/assessment, Canadian gillnet, and sport fisheries, 2014.................................. 21
Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2014.
............................................................................................................................................ 24
Table 3. Terminal run reconstruction for Stikine River sockeye salmon, 2014. .............. 26
Table 4. Taku River sockeye salmon run reconstruction, 2014. Estimates do not include spawning escapements below the U.S./Canada border. .48

## Table 5. U.S. inseason forecasts of terminal run size, total allowable catch, inriver run size,

 and the U.S. harvest of wild Taku River sockeye salmon for 2014................................... 50Table 6. Weekly large Chinook salmon guideline harvest for the Canadian commercial/assessment fishery in the Taku River for 2014. ............................................. 56
Table 7. Forecasts of terminal run size, allowable catch, and weekly guideline, and actual harvest of Taku River large Chinook salmon, 2014............................................... 58
Table 8. Canadian inseason forecasts of total run size, total allowable catch, and spawning escapement of wild Taku River sockeye salmon, 2014..................................................... 59
Table 9. Harvest and Klukshu River index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2014. ................................................................................. 69

## LIST OF FIGURES

## LIST OF APPENDICES

Appendix A. 1. Weekly harvest of Chinook salmon in the U.S. gillnet, troll, recreational,and subsistence and estimates of Stikine River bound Chinook salmon in District 108,2014.................................................................................................................................... 75Appendix A. 2. Weekly harvest of Chinook salmon in the Canadian commercial,Telegraph Aboriginal, and recreational fishery in the Stikine River, 2014....................... 75
Appendix A. 3. Weekly harvest of Chinook salmon in the Canadian test fisheries in the Stikine River, 2014. ..... 76
Appendix A. 4. Weekly harvest of sockeye salmon in the Alaskan District 106 and 108 fisheries, 2014. ..... 76
Appendix A. 5. Weekly stock proportions of sockeye salmon harvested in the Alaskan D106 commercial drift gillnet fishery, 2014. ..... 77
Appendix A. 6. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2014. ..... 78
Appendix A. 7. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2014. ..... 79
Appendix A. 8. Weekly stock proportions sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2014. ..... 80
Appendix A. 9. Weekly sockeye salmon harvest and effort in the Canadian commercial and assessment fisheries in the lower Stikine River, 2014. ..... 81
Appendix A. 10. Weekly sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery in the lower Stikine River, 2014. ..... 82
Appendix A. 11. Harvest by stock and week for sockeye salmon in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2014. ..... 83
Appendix A. 12. Weekly harvest, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye salmon stocks in the Stikine River test fishery, 2014 ..... 84
Appendix A. 13. Daily test harvest taken from the Tuya Assessment Fishery located above the Tahltan River, July 2014. ..... 84
Appendix A. 14. Weekly coho salmon harvest in the Alaskan District 106 and 108 fisheries, 2014. ..... 85
Appendix A. 15. Weekly harvest of coho salmon in the Canadian lower river commercial fishery and test fisheries 2014. ..... 85
Appendix A. 16. Weekly salmon effort in the Alaskan District 106 and 108 fisheries, 2014. ..... 86
Appendix A. 17. Weekly salmon effort in the Canadian fisheries in the Stikine River, 2014. ..... 86
Appendix A. 18. Tuya assessment fishery, 2014 ..... 87
Appendix A. 19. Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 2014. ..... 88
Appendix A. 20. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 2014. ..... 89
Appendix A. 21. Daily counts of adult Chinook salmon passing through Little Tahltan weir, 2014. ..... 90
Appendix B. 1. Historic salmon harvest and effort in the Alaskan District 106 commercial gillnet fishery, 1960-2014. ..... 91
Appendix B. 2 Historic salmon harvest and effort in the Alaskan District 108 commercial gillnet fishery, 1962-2014 ..... 92
Appendix B. 3. Annual harvest of Stikine River large Chinook salmon in the U.S. gillnet,troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmonin District 108, 2005-2014.93
Appendix B. 4. Chinook salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2014 ..... 93
Appendix B. 5. Chinook salmon harvest in the Canadian commercial and recreational fisheries in the Stikine River, 1979-2014. ..... 94
Appendix B. 6. Chinook salmon harvest in inriver test fisheries in the Stikine River, 1985- 2014. ..... 95
Appendix B. 7. Index counts of Stikine River large Chinook salmon escapements, 1979- 2014. ..... 96
Appendix B. 8. General stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; District 106 \& 108, 1982-2014 ..... 97
Appendix B. 9. Stikine River stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1982-2014. ............................ 98Appendix B. 10. Tahltan sockeye salmon stock proportions and harvest of in the Alaskancommercial gillnet fishery; Districts 106 \& 108, 1994-2014.99
Appendix B. 11. Stikine River sockeye salmon harvest in the U.S. Subsistence fishery, 2004-2014 ..... 99
Appendix B. 12. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2014 ..... 100
Appendix B. 13. All harvest in of sockeye salmon in Canadian commercial and assessment fisheries, 1972-2014. ..... 101
Appendix B. 14. Sockeye salmon stock proportions and harvest by stock in the Canadiancommercial and assessment fishery in the Stikine River, 1979-2014102
Appendix B. 15. Tahltan sockeye salmon stock proportions and harvest by stock in theCanadian commercial and assessment fishery in the Stikine River, 1979-2014.104
Appendix B. 16. Tahltan Lake weir data with enhanced and wild Tahltan fish, 1979-2014.105
Appendix B. 17. Sockeye salmon harvest by stock in the Stikine River under Canadian ESSR licenses, 1992-2014. ..... 105
Appendix B. 19. Aerial survey counts of Mainstem sockeye salmon stocks in the Stikine River drainage, 1984-2014. ..... 107
Appendix B. 21. Coho salmon harvest in the Alaskan District 106 and 108 test fisheries,1984-2014110
Appendix B. 22. Annual harvest of coho salmon in the Canadian lower and upper rivercommercial, Telegraph Aboriginal and the Canadian test fisheries, 1979-2014. ........... 111
Appendix B. 23. Index counts of Stikine River coho salmon escapements, 1984- 2014. ..... 112
Appendix B. 24. Effort in the Canadian fisheries, including assessment fisheries in the Stikine River, 1979-2014. ..... 113
Appendix B. 25. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-2014. ..... 114
Appendix B. 26. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 1984-2014. ..... 115
Appendix B. 27. Weir counts of Chinook salmon at Little Tahltan River, 1985-2014. 116Appendix B. 28. Historical pink and chum salmon harvest in the Canadian fisheries, 1979-2014................................................................................................................................. 117
Appendix C. 1. Weekly Chinook salmon harvest in the U.S. fisheries in D111, 2014.. 118
Appendix C. 2. Weekly Chinook salmon abundance estimates of above border run andharvest in the Canadian fisheries in the Taku River 2014.118
Appendix C. 3. Weekly sockeye salmon harvest of Alaskan D111 traditional and terminal common property commercial drift gillnet fishery, 2014. ..... 119
Appendix C. 4. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery, 2014. ..... 120
Appendix C. 5. Weekly sockeye salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2014. ..... 121
Appendix C. 6. Estimates of wild and enhanced sockeye salmon stock harvested in the Canadian commercial fishery in the Taku River by week, 2014. ..... 121
Appendix C. 7. Weekly coho salmon harvest in the traditional Alaskan District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2014 ..... 122
Appendix C. 8. Weekly coho salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2014. ..... 122
Appendix C. 9. Weekly effort in the Alaskan traditional District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2014. ..... 123
Appendix C. 10. Weekly effort in the Canadian commercial and assessment fisheries in the Taku River, 2014 ..... 123
Appendix C. 11. Daily counts of adult sockeye salmon passing through Tatsamenie weir, 2014. ..... 124
Appendix C. 12. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2014. ..... 125
Appendix C. 13. Daily counts of adult sockeye salmon passing through the King Salmon Lake weir, 2014. ..... 126
Appendix C. 14. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2014. ..... 127
Appendix C. 15. Daily counts of large Chinook salmon carcasses at the Nakina River weir, 2014. ..... 128
Appendix D. 1. All historic harvest and effort of salmon in the D111 gillnet fishery, 1960-2014.129
Appendix D. 2. Annual harvest estimates of Taku River large Chinook salmon in the D111 fisheries, 2005-2014. ..... 130
Appendix D. 3. Annual Chinook Salmon harvest in the Canadian fisheries in the Taku River, 1979-2014 ..... 131
Appendix D. 4. Taku River large Chinook salmon run size, 1979-2014. ..... 132
Appendix D. 5. Aerial survey index escapement counts of large (3-ocean and older) Taku River Chinook salmon, 1975-2014. ..... 133
Appendix D. 6. Annual sockeye salmon harvest in the Alaskan District 111 fisheries, includes estimates of Taku wild and enhanced fish in the gillnet, seine, and personal use fisheries, 1967-2014. ..... 134
Appendix D. 7. Stock proportions and harvest of sockeye salmon in the traditional Alaska District 111 commercial drift gillnet fishery, 1983-2014. ..... 135
Appendix D. 8. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet harvest by week, 1983-2014 ..... 136
Appendix D. 9. Annual sockeye salmon harvest estimates of wild and enhanced fish in the Canadian fisheries in the Taku River, 1979-2014. ..... 137
Appendix D. 10. Annual sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery on the Taku River, 1986-2014. ..... 138
Appendix D. 11. Annual sockeye salmon weir counts, escapements, and samples at the Tatsamenie weir, 1984-2014 ..... 139
Appendix D. 12. Annual sockeye salmon weir counts, escapements, and samples at the Little Trapper weir, 1983-2014 ..... 140
Appendix D. 13. Taku River sockeye salmon run size, 1984-2014 ..... 141
Appendix D. 14. The terminal run reconstruction of Taku wild and enhanced sockeye salmon, 1984-2014. ..... 142
Appendix D. 15. Annual sockeye salmon escapement estimates of Taku River and Port Snettisham sockeye salmon stocks, 1979-2014. ..... 143
Appendix D. 16. Historical Taku River coho salmon harvested in D111 terminal fisheries, 1992-2014 ..... 144
Appendix D. 17. Historical coho salmon in the Canadian fisheries in the Taku River, 1987- 2014. ..... 145
Appendix D. 18. Historic Taku River coho salmon terminal run size, 1987-2014 ..... 146
Appendix D. 19. Escapement counts of Taku River coho salmon. Counts are for age-. 1 fish and do not include jacks, 1984-2014 ..... 146
Appendix D. 20. Historical effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet) commercial drift gillnet fishery, 1960-2014. ..... 147
Appendix D. 21. Historical effort in the Canadian commercial fishery in the Taku River, 1979-2014 ..... 148
Appendix D. 22. Canyon Island fish wheel salmon counts and periods of operation on the Taku River, 1984-2014. ..... 149
Appendix E. 1. Weekly salmon harvest and effort in the lower Alsek River fisheries, 2014.150
Appendix E. 2. Weekly salmon harvest and effort in the Canadian Aboriginal and sport fisheries in the Alsek River, 2014. ..... 150
Appendix E. 3. Daily counts of salmon passing through Klukshu River weir, 2014. ..... 151
Appendix E. 5. Salmon harvest in the U.S. Chinook salmon test fishery in the Alsek River, 2005-2014. ..... 154
Appendix E. 6. Salmon harvest in the U.S. subsistence and personal use fisheries in the Alsek River, 1976-2014. ..... 155
Appendix E. 7. Salmon catches in the Canadian Aboriginal and recreational fisheries in the Alsek River, 1976 to 2014. ..... 156
Appendix E. 9. Annual Klukshu River weir counts of Chinook, sockeye, and coho salmon, 1976 to 2014. ..... 157
Appendix E. 10. Alsek River sockeye salmon escapement 2000 to 2014. ..... 158
Appendix E. 11. Alsek River sockeye salmon counts from U.S. and Canadian aerial surveys and from the electronic counter at Village Creek, 1985-2014. ..... 159
Appendix E. 12. Aerial survey index counts of Alsek River Chinook salmon escapements, 1984 to 2014. ..... 160
Appendix E. 13. Alsek River run of large Chinook salmon, 1997-2004. Estimates arebased on a mark-recapture study and include the percent of Chinook salmon.161
Appendix E. 14. Alsek River Chinook salmon escapement, 2007, 2011-2014 ..... 161
Appendix E. 15. Aerial survey counts of coho salmon from U.S. lower Alsek River tributaries, 1985-2000. ..... 162
Appendix F. 1. Tahltan Lake egg collection, fry plants, and survivals, 1989-2014. ..... 163
Appendix F. 2. Tuya Lake fry plants and survivals, 1991-2014 ..... 164
Appendix F. 3. Tatsamenie Lake egg collection, fry plants, and survivals, 1989- 2014. ..... 165
Appendix F.4. Trapper Lake egg collection, fry plants, and survivals, 1990-2014. ..... 166
Appendix G. 1. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 commercial drift gillnet, 2014 ..... 167
Appendix G. 2. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 sport fisheries, 2014. ..... 168
Appendix G. 3. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 commercial drift gillnet, 2014 ..... 169
Appendix G. 4. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 sport fisheries, 2014. ..... 170
Appendix G. 5. Weekly stock proportion estimates (mean) of sockeye salmon harvested inthe Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery,2014171
Appendix G. 6. Weekly stock proportion estimates (mean) of sockeye salmon harvested inthe Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery,2014.172

Appendix G. 7. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2014. .................................... 173
Appendix G. 8. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery by week, 2014...... 174

## ACRONYMS

| ADF\&G | Alaska Department of Fish and Game |
| :--- | :--- |
| AC | Allowable Catch |
| AF | Aboriginal Fishery |
| BLC | Base Level Catch |
| CAFN | Champagne Aishihik First Nation |
| CCPH | Cumulative Catch per Hour |

## EXECUTIVE SUMMARY

Final estimates of harvests and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek rivers for 2014 are presented and compared with historical patterns. Average, unless defined otherwise, refers to the most recent 10-year average (2004-2013). Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Preliminary results from TBR sockeye salmon Oncorhynchus nerka enhancement projects are also reviewed.

## Stikine River

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m}^{3}$ of debris into the river which blocked access to Tahltan River Chinook and sockeye salmon spawning sites until mid-July. In mid-July, Tahltan River flows dropped to a moderate to low flow regime which allowed fish passage around the landslide debris. Canadian estimates indicate that as many as $70 \%$ of Tahltan River Chinook salmon and $9 \%$ of Tahltan sockeye salmon may have failed to access their traditional spawning grounds due to the landslide.

The estimated 2014 Stikine River sockeye salmon run was 153,300 fish, of which approximately 67,900 fish were harvested in various fisheries including test fisheries. An estimated 81,900 Stikine River fish escaped to spawn, including 21,000 fish that migrated to the barrier in the Tuya River that were not harvested. The run was 41,800 fish below average and the harvest was 60,600 fish below average. The Tahltan Lake sockeye salmon total escapement of 39,800 fish was above the goal range ( 18,000 to 30,000 fish). The estimated U.S. commercial harvest of Stikine River sockeye salmon in Districts 106 and 108, including the Stikine River subsistence fishery, was 23,900 fish. The sockeye salmon harvest in the Canadian inriver commercial was 30,500 fish and the AF harvest was 10,000 fish. The inriver test fisheries (Inriver and Tuya) harvested 2,700 sockeye salmon. Weekly inseason run projections from the SMM ranged from 226,900 to 261,400 sockeye salmon; the final inseason model prediction was 226,900 fish, with a TAC of 163,900 fish. Weekly inseason run projections using other methods in concert with the SMM ranged from 190,800 to 269,100 sockeye salmon; the final inseason run size based on this approach was 234,500 sockeye salmon with a TAC of 170,440 fish. Based on the final postseason run size estimate $(153,500)$ and TAC estimate of 42,600 Stikine River fish for each country, Canada harvested $96 \%$ and the U.S. harvested $56 \%$ of their respective TACs. Broodstock collection removed 2,900 sockeye salmon from the escapement to Tahltan Lake leaving a natural spawning escapement of 36,900 fish. The estimated spawning escapement of 21,000 mainstem Stikine River sockeye salmon was within the goal range of 20,000 to 40,000 fish for this stock group.

The estimated 2014 Stikine River large Chinook salmon terminal run was 29,300 fish; above border run was 27,700 fish and spawning escapement was 24,400 fish. The run and harvest were below their respective averages. The Little Tahltan River large Chinook salmon escapement of 169 fish was below the Canadian escapement target of 3,300 fish
and below the lower bound of the Canadian target range of 2,700 to 5,300 fish. The Canadian estimate of Little Tahltan large Chinook salmon that did not pass the landslide was 347 fish. The estimated U.S. commercial harvest of Stikine River Chinook salmon in Districts 108 gillnet, test, troll, subsistence, and sport fisheries was 1,600 fish. The estimated Canadian commercial, Aboriginal, assessment/test, and sport fisheries harvest was 3,300 fish. Managers used harvest in the MR, model, and other assessment estimates to generate inseason run sizes after SW 24. The inseason run projections were consistent throughout the course of the fishery in predicting a total run size that was close to the preseason expectation of 26,100 . Weekly inseason run projections ranged from 25,000 to 26,700 large Chinook salmon.

The 2014 run size of Stikine River coho salmon cannot be quantified. The U.S. harvest of Stikine River coho salmon is also unknown since there is no stock identification program for this species. Mixed stock coho salmon harvest in District 106 was 286,800 fish (50\% Alaska hatchery) and District 108 was 30,200 fish (12\% Alaska hatchery), and were both well above average. The Canadian inriver coho salmon harvest of 5,400 fish was above average. The annual stream surveys indicated a below average return to the 6 index sites surveyed by Canada; however, inseason weekly CPUE of coho salmon from both the lower Stikine River Canadian fishery and sockeye salmon test fishery (incidentally caught coho salmon) was above average.

## Taku River

The final postseason estimate of the 2014 Taku River sockeye salmon terminal run is 143,500 fish, 141,200 wild fish and 2,400 hatchery fish. The U.S. harvested 32,300 Taku River wild fish and Canada harvested 17,300 Taku River wild fish and the estimated above border spawning escapement was 92,500 fish of which 91,600 were wild fish. The terminal run size was below average, the wild escapement was average for the same time period and above the goal range of 71,000 to 80,000 fish. The U.S. harvested an estimated $61 \%$ of the U.S. AC and Canada harvested an estimated $130 \%$ of the Canadian AC.

The estimated 2014 Taku River large Chinook salmon terminal run was 27,880 fish; above border run was 26,000 fish and spawning escapement was 23,530 fish. The run and harvest were below their respective averages. The total harvest of large Chinook salmon in the inriver assessment/test fishery and Canadian commercial, Aboriginal, and recreational fisheries in the Taku River was 2,470 fish. An assessment/test fishery with a modified goal of 1,200 large Chinook salmon was implemented as the amount of fish needed to obtain a reliable estimate was expected to be reduced due to increased tagging effort using drifted tangle nets in combination with the Canyon Island fish wheels. The traditional District 111 mixed stock drift gillnet fishery total harvest of 1,470 Chinook salmon was below average even when excluding those years in which a directed Chinook salmon fishery occurred.

The estimated above border run of Taku River coho salmon in 2014 is 140,700 fish, which is above average. The Canadian inriver commercial harvest of 14,500 coho salmon was nearly the highest on record, and the additional 2,000 fish harvested in the test fishery results in the largest recorded annual harvest. After all Canadian harvests are subtracted from the above border run, the above border spawning escapement is estimated at 124,200
coho salmon, which exceeds the PST minimum above border run of 38,000 fish, and is well above the 70,000 fish escapement target managed for until a bilateral escapement goal is finalized. The U.S. harvest of 54,200 coho salmon in the traditional District 111 mixed stock fishery was above average. Alaskan hatcheries contributed an estimated 4,000 fish, or $7 \%$ of the District 111 harvest.

The harvest of 29,200 pink salmon in the traditional District 111 fishery was far below average. No pink salmon were reported retained in the Canadian commercial inriver fishery in 2014. The escapement of pink salmon to the Taku River as evidenced by the fish wheel catch and release of 2,400 fish was well below the even-year average.

The harvest of chum salmon in the traditional District 111 fishery was 291,400 fish; composed of 288,400 summer run fish (prior to mid-August) and 3,000 fall run fish. The harvest of summer chum salmon, primarily Alaskan hatchery stocks, was below average. The harvest of fall chum salmon, composed of wild Taku River and Port Snettisham stocks, was also below average. There was nonretention of chum salmon in the Canadian inriver fishery and there was no reported harvest in 2014. Although spawning escapement is not known, the Canyon Island fish wheel catch of 310 chum salmon was above average.

## Alsek River

The Alsek River harvest of 33,700 sockeye salmon in the U.S. commercial fishery was well above average. The Canadian inriver Klukshu River recreational fishery reported no harvest (8 sockeye salmon were released) and 1,140 fish were harvested in the Aboriginal fishery. The Klukshu River weir count of 12,400 sockeye salmon was slightly above average and was above the escapement goal range of 7,500 to 11,000 fish. The count of 2,700 early run sockeye salmon (i.e. through August 15) and the late run count of 9,700 fish were both above average.

The Chinook salmon run to the Alsek River was below average. The U.S. Dry Bay harvest of 1,070 large Chinook salmon was above average. The Canadian recreational fishery harvest of 30 fish was below average and the Aboriginal harvest of 20 fish was below average. The 840 Chinook salmon counted through the Klukshu River weir was below average and the estimated escapement of 830 was within the escapement goal range of 800 to 1,200 Chinook salmon.

Current stock assessment programs prevent an accurate comparison of the Alsek River coho salmon run with historical runs. There was minimal effort during the U.S. Dry Bay coho salmon fishery and harvest figures are negligible. The Canadian recreational and Aboriginal fisheries harvested no coho salmon. The operation of the Klukshu River weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is over

## Enhancement

In 2014, eggs and milt were collected from sockeye salmon escapements at Tahltan and Tatsamenie lakes. A total of approximately 3.9 million eggs were collected at Tahltan Lake, and 1.5 million at Tatsamenie Lake. Prior to the start of egg collection at Tahltan Lake, Canada advised Alaska that they were revising the goal to 5.0 million (from 6.0) because of a decision they had made to stop releases into Tuya Lake; their technical staff had determined that the fry from a 5.0 million level egg take could all be planted into Tahltan Lake without exceeding agreed to stocking guidelines. The revised egg-take goal at Tahltan Lake was not achieved. The egg-take goal of 2 million at Tatsamenie Lake was not achieved due to low escapement however the alternative target of $30 \%$ of the female escapement used for broodstock was applied to the project as per the bilaterally agreed Taku Enhancement Production Plan.

In 2014, outplants of broodyear 2013 sockeye salmon fry were as follows: 2.1 million fry into Tahltan Lake; 462,000 fry into Tuya Lake; 1.1 million fry; and 185,000 extendedrearing fry into Tatsamenie Lake. Green-egg to planted-fry survivals were 60\%, and 73\% for Tahltan, and Tatsamenie lakes; respectively. Survivals were somewhat lower due to IHNV loss. An estimated 370,000 pre-emergent fry from two Tahltan Lake stock incubators and 184,000 pre-emergent fry from one Tatsamenie Lake stock incubator were confirmed positive with IHNV and destroyed.

Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate weekly contribution of fish from U.S./Canada TBR fry planting programs to District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku rivers. Preliminary contribution estimates of stocked fish to Alaskan harvests were 9,800 stocked Stikine River fish to District 106 and 108, and 900 stocked Taku River fish to District 111. Preliminary estimates of contributions to Canadian fisheries included 15,500 stocked fish to Stikine River fisheries and 400 stocked fish to the Taku River fisheries.

## INTRODUCTION

This report presents final estimates of the 2014 harvest and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek rivers and describes management actions taken during the season. Harvest and effort data are presented by week, for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku rivers are also summarized.

The TTC met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: PSC TTC, TCTR (13)-1 Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers, 2014. In prep 2014.

Run reconstruction analyses are conducted on the sockeye salmon Oncorhynchus nerka and Chinook salmon O. tshawytscha runs to the Stikine and Taku rivers and to the Taku River for coho salmon $O$. kisutch for the purpose of evaluating the stocks and the fisheries managed for these stocks. No estimates of marine harvest are made for Alaskan fisheries outside of District 106 and 108 for Stikine River stocks, District 111 for Taku River stocks and Subdistrict 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial gillnet and troll fisheries as well as recreational and subsistence fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet and test fisheries located in the lower and upper Stikine River, and by a Canadian AF in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are occasionally operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A recreational fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a U. S. personal use fishery was established in the lower Stikine River; no harvests were reported in this fishery in 1995 through 2000. Approximately 30 sockeye salmon were harvested in 2001, and the personal use fishery on the Stikine River was not open in 2002 and 2003. A U.S. subsistence fishery was opened in 2004 for sockeye salmon and in 2005 for Chinook and coho salmon. Additional harvests of salmon, of an unknown quantity, are taken in U.S. troll, gillnet, seine, and sport fisheries in locations beyond Districts 106 and 108.

In 1993, the U.S. spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108. The three areas in District 108 and one area in District 106 have remained unchanged and have opened in the absence of District 108 directed Stikine River Chinook salmon fisheries.

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m}^{3}$ of debris into the river which blocked access to Tahltan

River Chinook and sockeye salmon spawning sites until mid-July. In mid-July Tahltan River flows dropped to a moderate to low flow regime resulting in adequate fish passage around the landslide debris. Canadian estimates indicate that as many as 70\% (9,300fish) of the Tahltan River Chinook salmon population failed to pass the landslide and, therefore, failed reach their traditional spawning grounds. The Tahltan sockeye salmon population migrated later, during a low flow regime, and Canadian estimates indicate $9 \%(3,500)$ of fish did not make it past the landslide and therefore failed to spawn. On average, 53\% of the Chinook salmon and $45 \%$ of the sockeye salmon for the total Stikine River spawn in the Tahltan drainage. A salvage operation conducted by Tahltan First Nations and DFO succeeded in capturing and air lifting 1,100 Chinook salmon and 3,700 sockeye salmon above the landslide during the month of July. Plans were developed and carried out in March 2015 to improve fish passage at the landslide in anticipation of the 2015 salmon return. Some large boulders that constricted flow were split using an industrial expansion compound; fragments were moved downstream by hand and by spring freshet flows.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Fishing arrangements in place for salmon originating from the Canadian portion of the Stikine River watershed are provided in Annex IV, Chapter 1 of the PST and can be found at: http://www.psc.org/pubs/treaty.pdf. These arrangements include: directed fisheries for Chinook salmon; continuation of a U.S. subsistence fishery on Chinook, sockeye, and coho salmon stocks within the U.S. section of the Stikine River; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the presumed production of enhanced fish.

As in most previous years, the TTC met prior to the season to update joint management and enhancement plans, develop run forecasts, and determine new parameters for input into the inseason Chinook and sockeye salmon run projection models. The Chinook salmon model is referred to as the SCMM and served as a key management tool governing weekly fishing regimes for Stikine River Chinook salmon. The SCMM, however, was complemented inseason with a concurrent MR study and other inriver assessment methods. The sockeye salmon model is referred to as the SMM. The SMM was complemented inseason with concurrent inriver run size estimates based on fishery performance against historical fishery performance and run size estimates.

## Chinook Salmon

The SCMM model is based on the linear regression (correlation) between weekly cumulative CPUE of large Chinook salmon at the tagging site, located near the mouth of the Stikine River, and total run size based on MR studies conducted in 1996-2013. Most of the CPUE and run size data sets (CPUE vs. run size) are significantly correlated. Inseason model estimates were available commencing in SW 24 (Table 1). Mark-recapture estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were generated commencing in SW 24. In order to abide by Annex IV, Chapter1, Paragraph 3(a)(3)(vii), which obliges the Parties to apportion their overall TAC by historical weekly run timing, weekly fishery openings were announced based on weekly guideline harvests.

The preseason run size estimate of 26,100 large Chinook salmon was below the threshold run size limit of 28,100 fish (Table 1); hence, no new directed Chinook salmon fisheries were permitted at the outset of the fishing season. The threshold number is the sum of the midpoint escapement goal $(21,000)+$ the Canadian BLC $(2,300)+$ the U.S. BLC $(3,400)$ + the inriver test fishery harvest $(1,400)$. Both countries, however, are permitted to harvest Chinook salmon caught as bycatch taken in the course of the targeted sockeye salmon fisheries for run sizes forecasted to be below 28,100. Moreover, an assessment/test fishery continued to be implemented on the Canadian side of the border and was designed to provide inseason run estimates while harvesting a maximum of 1,400 large Chinook salmon.

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, and troll fisheries and the inriver test/assessment, Canadian gillnet, and sport fisheries, 2014.

${ }^{\text {a }}$ Average of mark-recapture and Stikine Chinook Management Model

The preseason forecast for the Stikine River large Chinook salmon terminal run was approximately 26,100 fish (Table 1), which indicated a run size characterized as below average. Joint Canadian and U.S. inseason predictions of terminal run size ranged from 25,000 to 26,700 large Chinook salmon (Table 1). Managers used the daily harvest and effort data transmitted from the Kakwan Point tagging site and from the commercial fishing grounds to make weekly run projections based on the SCMM and MR models. Joint weekly run size estimates were calculated on Wednesday or Thursday of the current week and were used to set the following week's fishery openings. Managers used the average of SCMM and MR estimates for SWs 25-29. Based on MR data from the inriver commercial fishery tag recoveries, tag recoveries from Verrett and Little Tahltan river escapement sampling, and tag recoveries collected during the Tahltan fish salvage project, the postseason estimate of the terminal run size of Stikine River large Chinook salmon was 29,300 fish, above the
final preliminary inseason estimate of 26,700 large Chinook salmon (Table 1). The 2014 Little Tahltan escapement of 169 fish represents less than $1 \%$ of the total Stikine River escapement of 24,400 fish, compared to the average of approximately $13 \%$ (landslide mortality of Little Tahltan large Chinook salmon estimate is 347).

## Sockeye Salmon

The preseason forecast for the Stikine River sockeye salmon run was approximately 152,400 fish (Table 2), and characterized as a below average run. The forecast included approximately 34,100 natural Tahltan sockeye salmon, 37,400 enhanced Tahltan sockeye salmon, 25,100 enhanced Tuya sockeye salmon, and 55,800 mainstem sockeye salmon. The preseason forecast was used in SW 26 for the inriver fishery. After SW 26, Canada used the SMM and other methods to generate weekly run sizes. The U.S. used the SMM beginning in SW 28 for District 106 and 108.

In 2014, Canada was obligated under Annex IV, Chapter 1, Paragraph 4 of the PST to take corrective actions to bring future catches in alignment with Treaty provisions. This paragraph was triggered given that Canada exceeded its Treaty harvest share of sockeye salmon on three occasions during the past five years. As such, Canada reduced its TAC of Tahltan Lake sockeye salmon by $27 \%$, which mirrored the average TAC overage that Canada has harvested since 2009.

Starting in SW 27, weekly inputs of the harvest, effort, and stock composition were entered into the SMM to provide weekly forecasts of run size and TAC. Specific inputs include proportion Tahltan/Tuya from egg diameters, proportion enhanced Tuya from thermal mark analyses of otoliths in the Canadian lower river test (when in operation) and commercial fisheries; the upper river harvest in the AF and upper river commercial fishery; the harvest, effort and assumed stock composition in Subdistrict 106-41 (Sumner Strait), District 108, and Subdistrict 106-30 (Clarence Strait).

The SMM provides inseason projections of the Stikine River sockeye salmon run, including: the Tahltan stock (wild and enhanced combined); the stocked Tuya stock; and the mainstem stocks. The SMM uses linear regression by historical stock specific harvest data to predict run size from cumulative CPUE for each week of the fisheries. It breaks the stock proportions in District 106 and 108 harvests, from historical postseason scale pattern analysis (SPA) into triggers of run size for Tahltan and Mainstem; the averages used each week depended upon whether the run was judged to be below average ( $0-40,000$ fish), average ( $40,000-80,000$ fish), or above average ( $+80,000$ fish). The SMM for 2014 was based on CPUE data from 1994 to 2011 from the Alaska District 106 fishery and the Canadian commercial fishery in the lower river and from the lower Stikine River test fishery from 1986 to 2004. The enhanced Tuya and Tahltan stock proportions are adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108.

Generally, the SMM has used the Canadian Lower River Commercial (LRCF) fishery CPUE to estimate the inriver run size, but both LRCF and Lower River Test fishery CPUE were entered into the SMM model to compare and contrast the respective run sizes generated from each of the inputs. In 2014 the upper commercial fishing zone (Flood
fishery) was not opened for harvest; in years that it is opened, the harvest and effort from this area are excluded from the CPUE and not used in the model estimate. The annual weekly CPUE values were adjusted in order to make the current year data comparable with historical CPUE. For example, during 1979-1994 and 2000-2004, 2010-2013, only one net per licence was permitted, while in 1996-1999 and 2005-2009 two nets per license were allowed. Only one net was permitted in the 2014 fishing season and the model was adjusted accordingly.

In 2014, we tested a new model, the Stikine Forecasting Management Model (SFMM). This model was based on a second order polynomial relationship between weekly cumulative harvest or CPUE in District 106-41/42 and yearly run size. Triggers of run size for the Tahltan stock were $\leq 98,000$ or $>98,000$ fish in the District 106-41 fishery, and 0, $<46,000$, or $>175,000$ fish in the District 108 fishery. Triggers were not used for the mainstem stock. Additional model runs using cumulative harvest or CPUE in the District 108 sockeye salmon area was also tested. The sockeye salmon area harvest and CPUE in District 108 does not include 108-20 and 108-10 fishing areas, or midweek openings.

Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2014.

${ }^{\mathrm{a}}$ The posteason estimate Stikine Management Model was not used to estimate the Tahltan portion of the run.

The weekly inputs to the Tahltan sockeye salmon regression model included the cumulative weekly CPUE of Tahltan Lake sockeye salmon (1998-2008: from SW 28 to 33 all correlations were significant and ranged from an $r^{2}$ of 0.67 in SW 28 to an $r^{2}$ of 0.91 SW 33). The contribution of Tuya origin sockeye salmon was based on otolith marks and presented as a ratio of the total Tahltan run size. The contribution of mainstem sockeye salmon was based on egg diameter measurements and presented as a ratio of total Tahltan run size or calculated based on a regression of cumulative CPUE against the inriver run size (1998-2008: from SW 28 to 33 all correlations were significant and ranged from an $\mathrm{r}^{2}$ of 0.31 in SW 28 to an $r^{2}$ of 0.64 SW 33). The contribution of Tuya sockeye salmon (thermal marks) and mainstem sockeye salmon (large eggs) were expressed as a ratio of the total Tahltan Lake run. Preliminary results of thermal mark analyses were available
inseason for the marine and lower river fisheries to account for Tuya production in the model and reduce the risk of over estimating the TAC of Tahltan sockeye salmon.

Canadian inseason predictions of total run ranged from 190,800 to 269,100 sockeye salmon; U.S. forecasts ranged from 226,900 to 261,400 (Table 2). Differences in U.S. and Canadian weekly predictions are due to different approaches to assessing the inseason run size, with Canada electing to forego the SMM estimates exclusively and use the run reconstruction and Tahltan/mainstem sockeye salmon regression assessment methods in concert with the model estimate for all of the fishing season; the U.S. used the SMM exclusively in assessing weekly run sizes.

Table 3. Terminal run reconstruction for Stikine River sockeye salmon, 2014.

U.S. overage/underage

Canada overage/underage
${ }^{\text {a }}$ Escapement into terminal and spawning areas from traditional fisheries.
${ }^{\mathrm{b}}$ Harvest allowed in terminal areas under the Excess Salmon to Spawning Requirement license.
${ }^{\text {c }}$ Fish returning to the Tuya system are not able to access the lake where they originated due to velocity barriers.
${ }^{\mathrm{d}}$ The number of Tuya fish that should be passed through traditional fisheries in order to harvest the Tuya stock at the same rate as the Tahltan stock to ensure adequate spawning escapement for Tahltan fish.
${ }^{\mathrm{e}}$ Includes traditional, ESSR, and test fishery Harvestes.
${ }^{\mathrm{f}}$ Does not include ESSR or test fishery Harvestes.
${ }^{\mathrm{g}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for Harvestes other than in the listed fisheries.

## U.S. Fisheries

The 2014 District 106 drift gillnet fishery overall salmon harvest was above average, but was highly variable by species. District 106 harvests included 2,092 Chinook, 58,430 sockeye, 286,815 coho, 415,392 pink, and 106,243 chum salmon. Pink and coho salmon harvests were well above average, Chinook salmon harvest was average, and sockeye and chum salmon harvest were well below average. Stock compositions by species were similar to prior years. An estimated 1,085 Chinook salmon in the District 106 harvest (52\%) were of Alaska hatchery origin. An estimated 6,710 Stikine River sockeye salmon were harvested in District 106, approximately 12\% of the harvest. An estimated 142,685 coho salmon in the District 106 harvest were of Alaska hatchery origin.

Stikine River sockeye salmon harvests in the two major fishing areas of District 106 were again markedly different. The Sumner Strait fishery (Subdistrict 106-41) harvested an estimated 6,087 Stikine River sockeye salmon, contributing 19\% of the total sockeye salmon harvest in that subdistrict. The Clarence Strait fishery (Subdistrict 106-30) harvested an estimated 623 Stikine River sockeye salmon, contributing $2 \%$ of the total sockeye salmon harvest in that subdistrict.

Overall effort in the District 106 drift gillnet fishery was above average. District 106 was open for 58 days from June 16 through October 8, which was above the average of 48 days. Weekly fishing effort in number of vessels fishing in District 106 was below average for the first quarter and above average for most of the remainder of the season. The greatest effort of vessels fishing occurred in SW 37 (September 7-13) with 96 boats fishing. The total season effort was above average with 3,281 boat days in 2014.

The 2014 District 108 drift gillnet salmon harvest was well below average. District 108 harvests included 8,023 Chinook, 19,808 sockeye, 30,184 coho, 33,830 pink, and 84,771 chum salmon. Harvest of coho salmon was average, while Chinook, sockeye, pink, and chum salmon were well below average. An estimated 6,800 Chinook salmon in the District 108 harvest (85\%) were of Alaska hatchery origin. Harvests of Stikine River large Chinook salmon in the District 108 drift gillnet fishery through SW 28 is estimated to be 204 fish. The District 108 drift gillnet fishery harvested an estimated 15,643 Stikine River sockeye salmon, contributing to $79 \%$ of the District 108 sockeye salmon harvest. An estimated 12\% (3,742 fish) of the District 108 coho salmon harvest was of hatchery origin.

Overall effort in the District 108 drift gillnet fishery was below average. District 108 opened on June 16 and closed on October 8 for a total of 62 days open, which was above average when excluding years when a directed Stikine River Chinook salmon fishery occurred. Weekly fishing effort, in number of vessels fishing in District 108, was below average for all openings with about one-third of the openings receiving less than half the average number of participants. The greatest effort in vessels fishing occurred in SWs 30 and 31 with 53 boats fishing in each of those weeks. The total season effort in boat days was below average with 1,501 boat days in 2014.

In 2014, the U.S. Federal subsistence Chinook, sockeye, and coho salmon fisheries were conducted on the Stikine River and were managed by the USFS. Subsistence fisheries were restricted to federally qualified users and a permit issued by the USFS was required to participate. Subsistence fishing was restricted to the waters of the Stikine River from marine waters to the U.S./Canadian border and fishing in "clearwater" tributaries or side channels or at stock assessment sites was prohibited. Annual guideline harvest levels were 125 Chinook, 600 sockeye, and 400 coho salmon. Allowable gear for the fishery included: dipnets, spears, gaffs, rod and reel, beach seine, and gillnets not exceeding 15 fathoms in length with mesh size no larger than $51 / 2$ inches, except during the Chinook fishery when nets with mesh up to 8 inches were allowed. Subsistence fishing was allowed from June 14 to June 20 to target Chinook salmon, June 21 to July 31 to target sockeye salmon, and August 1 to October 1 to target coho salmon. In 2014, a total of 125 permits were issued and the estimated harvests included 56 large Chinook, 1,527 sockeye, and 143 coho salmon.

The preseason forecast of 26,100 Stikine River large Chinook salmon was not large enough to yield any AC. Inseason forecasts ranging between 25,031 and 26,150 Stikine River large Chinook salmon were similar to the preseason forecast and yielded minimal U.S. ACs. The postseason estimate of the total terminal run size based on MR information is 29,300 Stikine River Chinook salmon netting a U.S. AC of 480 fish (Table 1).
U.S. harvest of Stikine River large Chinook salmon in all District 108 fisheries were minimal and well below the U.S. TAC. Estimated harvest of Stikine River large Chinook salmon harvested by District 108 drift gillnet fishery from SWs 25 through 29 (during sockeye salmon management period) was 204 fish. The District 108 Spring Troll fishery began May 4 and was limited to two hatchery access areas near Anita Bay. The estimated harvest of Stikine River large Chinook salmon in the District 108 troll fisheries was 677 fish. In 2014, the District 108 sport fishery was not liberalized. Harvest of Stikine River Chinook salmon in the sport fishery is estimated to be 697 fish. A directed U.S. subsistence Chinook fishery was opened on June 14 after the inseason estimate produced on June 12 yielded a U.S. AC of 53 fish. A total of 3 fish were harvested during the directed Chinook salmon subsistence fishery. An additional 41 fish were harvested during the subsistence sockeye salmon fishery through SW 29 for a total of 44 fish. The U.S. cumulative harvest estimate through SW 29 was 1,622 fish, well below the U.S. TAC of 3,880 Stikine River large Chinook salmon.

Forecasts of Stikine River sockeye salmon in 2014 were highly variable. The preseason forecast was for a below average terminal run size of 152,300 with a U.S. AC of 44,000 fish (Table 2). The preseason forecast was used for SWs 25 through 27. Inseason estimates of terminal run size were first produced on a weekly basis beginning in SW 27 and were used for SW 28 through the end of season. The final inseason estimate was produced in SW 32. Inseason estimates ranged between 226,900 and 261,400 fish. The postseason estimate of the Stikine River sockeye salmon run is 153,323 fish. The resultant U.S. AC is 42,633 Stikine River sockeye salmon. The postseason estimate of U.S. harvest of Stikine River sockeye salmon, based on genetic analysis, is 23,881 fish (Table 3).
Directed sockeye salmon drift gillnet fisheries in Districts 106 and 108 began in SW 25 at 12:00 noon on Monday, June 16, for an initial two-day period. By regulation, Monday
openings occurred during the first two sockeye salmon periods. This initial sockeye salmon opening was postponed by one week due to a low sockeye salmon forecast and how the early the initial opening would have been (June 9). In addition, there was concern for the abundance of the Stikine River Chinook salmon in District 108. In addition to delaying the start of the sockeye salmon fishery, area restrictions were implemented in District 108 to limit the harvest of Stikine River Chinook salmon. Limited inseason data and mediocre sockeye salmon catches did not indicate a higher abundance of sockeye salmon than the preseason forecast. As a result no additional time was given in either district. Effort consisted of 9 boats in Clarence Strait (106-30), 24 boats in Sumner Strait (106-41), and 45 boats in District 108.. An estimated 3,400 Stikine River sockeye salmon were harvested in the District 106 and 108 drift gillnet fisheries this week.

The District 106 and 108 drift gillnet fisheries in SW 26 (June 22-June 28) were similar to SW 25. Both fisheries opened at 12:00 noon on Sunday, June 22 for an initial two-day period. Fishing time was based on the below average forecast and near average catches the prior week. Areas restrictions in District 108 were relaxed back to the Old Stikine River closure line that restricts fishing to areas beyond the Stikine River delta. During SW 26, 16 boats fished in Sumner Strait, 10 boats fished in Clarence Strait, and 36 boats fished in District 108. On the grounds surveys of the gillnet fleet did not indicate an abundance of sockeye salmon well above the preseason forecast; therefore, no additional fishing time occurred. An estimated 3,300 Stikine River sockeye salmon were caught this week with the majority (2,500 fish) being harvested in District 108.

Fishing time and harvests in both districts increased in SW 27 (June 29-July 5). With near average sockeye salmon harvest rates and a low sockeye salmon harvest due to low effort occurring in both districts in the prior two weeks, both districts were opened for an initial three days. On the grounds surveys of the gillnet fleet indicated improving sockeye salmon abundance and effort remained well below average. Catches from the Canadian
fisheries in the Stikine River for the second week in a row indicated the run was likely higher than the preseason forecast indicated. A one day midweek opening for District 108 beginning July 3 was announced from the grounds. Consequently, the effort level was very low allowing the midweek opening to be extended one day. There were 17 boats in Sumner Strait, 19 boats in Clarence Strait, and 33 boats in District 108. Harvest of Stikine River sockeye salmon increased substantially this week with an estimated 7,100 fish harvested in the gillnet fisheries. Like SW 26, the majority (5,400 fish) of the Stikine River sockeye salmon harvest was from District 108.

During SW 28 (July 6-July 12), Districts 106 and 108 were again opened for an initial three days. Inseason forecast of Stikine River sockeye salmon terminal run size was at 261,400 fish with a resultant U.S. AC of 99,600 fish was considerably larger than the preseason forecasts (Table 2). The U.S. cumulative harvest of Stikine River sockeye salmon through SW 27 was 14,000 fish. On the grounds surveys of the gillnet fleet indicated above average sockeye salmon abundance. Effort remained well below average, which allowed for a one day extension in both districts. Despite extra time in both districts, the harvest of Stikine River sockeye salmon was substantially less than the prior week with an estimated 2,500 fish harvested. Similar to prior weeks, the majority harvest was from

District 108. The low harvest could be largely attributed to the low effort in both districts. There were 25 boats in Clarence Strait, 17 boats in Sumner Strait, and 20 boats in District 108.

Week 29 (July 13-July 19) was similar to the prior two weeks. The inseason forecast was for a terminal run size of 241,000 Stikine River sockeye salmon resulting in a U.S. AC of 89,000 fish (Table 2). Both districts were open for an initial three day period beginning Sunday, July 13. On the grounds surveys of the gillnet fleet indicated below average effort and sockeye salmon harvest. Due to well below average effort, expected low harvest of Stikine River sockeye salmon, and available AC, a one day midweek opening occurred in District 108. An estimated 2,250 Stikine River sockeye salmon were harvested in SW 29 with a cumulative harvest through SW 29 of 18,700 fish. During SW 29, 32 boats fished in Clarence Strait, 20 boats fished in Sumner Strait, and 37 boats fished in District 108.

Harvests and run size estimates in SW 30 (July 20-July 26) were similar to SW 29. The inseason forecast was for a terminal run size of 242,500 Stikine River sockeye salmon resulting in a U.S. AC of 90,000 fish (Table 2.) Both districts were open for an initial three day period. On the grounds surveys of the gillnet fleet indicated near average effort and sockeye salmon harvest in District 106 and below average effort and sockeye salmon harvest in District 8. Due to the low effort in District 108 and available U.S. AC, a two day midweek opening occurred in District 108. An estimated 2,050 Stikine River sockeye salmon were harvested by U.S. fisheries this week. Effort increased by 30 boats for Districts 106 and 108 during SW 30 with 35 boats in Clarence Strait, 31 boats in Sumner Strait, and 53 boats in District 108.

Week 31 (July 27-August 2) through the end season, sockeye salmon harvests fell sharply and continued to decline each week. SW 31 was the final week of sockeye salmon management in both districts. Both districts were open for an initial three day period beginning July 27. The inseason forecast fell from prior weeks, but was still well above the preseason forecast. The inseason forecast was for a terminal run size of 234,000 Stikine River sockeye salmon (Table 2). Effort in 31 was 23 boats fishing in Clarence Strait, 33 boats in Sumner Strait, and 53 boats in District 108. On the grounds surveys of the gillnet fleet indicated below average harvest of sockeye salmon with average effort in District 106 and below average effort and sockeye salmon harvest in District 108. Due to the low effort and low anticipated sockeye salmon harvest in District 108 and available U.S. AC, a two day midweek opening occurred in District 108. The estimated U.S. harvest of Stikine River sockeye salmon in SW 31 was 600 fish with a cumulative harvest through SW 31 of 21,350 fish. An estimated 800 Stikine River sockeye salmon were harvested in the District 106 and 108 drift gillnet fisheries through the remainder of the season.

During SWs 32 through 35 (August 3-August 30), both Districts 106 and 108 were managed based on pink salmon abundance. That portion of Section 6-D in District 106 along the Etolin Island shoreline was closed to gillnet fishing from SW 32 through SW 35 by regulation. In Districts 106 and 108, four day openings occurred in SWs 32 through 34 and SW 35 was open for three days. Effort was above average during this period time in all weeks but SW 33.

Beginning in SW 36 (August 31-September 6) the management emphasis changed from pink salmon to coho salmon. Prior to the switch to coho salmon management, the District 106 fishery harvested 123,000 coho salmon, approximately 43\% of the total District 106 coho salmon harvest. The hatchery contribution estimate is d 63,000 fish in the District 106 fishery prior to SW 36. The Neck Lake/Burnett Inlet enhanced summer coho salmon run comprised the majority of this early coho salmon harvest. During the coho salmon management period, coho salmon harvests were well above average in District 106 with an estimated harvest of 79,400 hatchery fish and 84,400 wild coho salmon. Harvest of wild coho salmon in District 108 was above average with an estimated harvest of 26,400 fish. During the coho salmon management period, both districts had four day openings through SW 40 and then stepped down to three days for the final opening in SW 41. The 2014 gillnet season concluded at noon on Wednesday, October 8, in both districts.

## Canadian Fisheries

Harvests from the combined Canadian commercial, Aboriginal gillnet, and sport fisheries in the Stikine River in 2014 included; 1,974 large Chinook (includes 8 release mortalities), 618 nonlarge Chinook (includes 4 release mortalities), 40,985 sockeye, 5,490 coho, 60 chum, and 69 pink salmon. In addition 417 pink and 323 chum salmon were released; all of the 408 steelhead caught were released. A test/terminal area fishery designed to target on Tuya bound fish at a site located in the mainstem Stikine River between the mouth of the Tahltan and the mouth of the Tuya River yielded a harvest of 833 sockeye, 19 large Chinook, and 5 nonlarge Chinook salmon. A total of 1,319 large Chinook and 127 nonlarge Chinook salmon were harvested by the commercial fleet under the auspices of an assessment/test fishery.

The harvest of large Chinook salmon was below average and the lowest harvest recorded since the targeted Chinook fishery started in 2005. Harvests of nonlarge Chinook salmon were also well below average. The sockeye salmon harvest was below average. The final estimate of the total contribution of sockeye salmon from the Canada/U.S. fry-stocking programme to the combined Canadian Aboriginal and commercial fisheries was 21,582 fish, $53 \%$ of the harvest. The harvest of 5,409 coho salmon was above average.

A sockeye salmon test fishery was conducted for stock assessment purposes in the lower Stikine River from 24 June to 31 August, 2014. The test fishery was located immediately upstream from the Canada/U.S. border. Test fishery catches totaled 23 large Chinook, 18 nonlarge Chinook, 1,787 sockeye, 342 coho, 45 pink, 66 chum salmon, and 90 steelhead trout (all steelhead trout were released). The objectives of the sockeye salmon test fishery were similar to those in previous years: to provide inseason catch, stock ID and effort data for input, if necessary, into the SMM to estimate the inriver run size; and, to determine migratory timing and stock composition of the sockeye salmon run for use in the postseason estimations of the inriver sockeye salmon run.

Due to budgetary constraints no annual coho salmon test fishery was conducted in the lower Stikine River in 2014.

## Lower Stikine River Commercial Fishery

Canadian commercial fishers in the lower Stikine River harvested 896 large Chinook (plus 8 release mortalities), 511 nonlarge Chinook plus release mortalities), 30,487 sockeye, 5,409 coho, 69 pink, and 60 chum salmon. A total of 408 steelhead trout were released in 2014; 417 pink and 323 chum salmon were also released. In respect to the large Chinook salmon catch, 169 fish were harvested in a directed Chinook fishery (SW 25) and 727 in a directed sockeye salmon fishery (SWs 26-33). Additional harvests of 1,319 large Chinook salmon were taken in the assessment/test fishery. The catches of sockeye, large Chinook, and nonlarge Chinook salmon were below average, while the harvest of coho salmon was above average. The commercial fleet targeted large Chinook salmon in SW 25 only. This was due to a slight increase in the inseason estimated run size of large Chinook salmon ( 25,000 fish) leading to SW 25 , which exceeded the threshold run size of 24,500 large

Chinook salmon required to provide for a directed commercial fishery. Post SW 25, the fishery was managed based on run size and TAC of returning sockeye salmon.

The fleet targeted Chinook salmon for a total of 0.17 days ( 4 hrs ), which was well below the average of 16 days. Sockeye salmon were targeted for a total of 19 days, below the average of 30 days. The coho salmon fishery was opened for a total of 9 days, below the average of 13 days.

The stock composition of the lower river sockeye salmon harvest was as follows: 7,953 enhanced Tahltan fish, which accounted for $26.1 \%$ of the sockeye salmon harvest; 8,725 wild Tahltan fish accounting for $28.6 \%$ of the harvest; 6,391 mainstem fish accounting for $21.0 \%$ of the harvest; and, 7,418 stocked Tuya fish accounted for $24.3 \%$ of the harvest (Table 3)

Weekly Chinook and sockeye salmon guideline harvests, based on SCMM, SMM, MR and other forecasts of the TAC apportioned by average run timing and domestic and international allocation agreements, were developed each week to guide management decisions during the Chinook and sockeye salmon seasons. For purposes of managing the lower river catch after SW 25, 800 large Chinook salmon were allocated to the upper Stikine River commercial and Aboriginal fisheries, The allocation consisted of 100, 20, and 680 large Chinook salmon in the sport, upper commercial and AF, respectively. A total of 8,000 sockeye salmon was allocated to the upper Stikine River commercial and AF. The remaining balance of the Chinook and sockeye salmon TAC was allocated to the lower Stikine River commercial fishery. Particular attention was directed at weekly Chinook salmon guideline harvests and the inriver run and escapement projections of the various sockeye salmon stock groupings. Management through SW 24 was focused primarily on the harvest of large Chinook salmon taken in the assessment test fishery (the fishery was opened as a directed fishery in SW 25). From SW 26 through SW 29, management emphasis switched to the Tahltan and Tuya lake sockeye salmon stock groupings, after which time the sole focus was the management of mainstem sockeye salmon stocks through the end of the sockeye salmon fishery in SW 34. As in 2010-2013, the management of mainstem sockeye salmon was advanced from SW 31 to SW 30 in 2014 in an attempt to avert the downward trending escapement of this stock grouping. The coho salmon management regime commenced on SW 35.

The preseason estimate of 26,100 large Chinook salmon was below the treaty agreed to threshold run size of 28,100 fish that triggers a directed fishery. Targeted commercial fisheries, therefore, could be not prosecuted by Canada or the U.S. In order to generate weekly and postseason run size estimates a Chinook salmon assessment/test fishery was prosecuted (Herein referred to as an assessment fishery). The assessment/test fishery harvest was capped at 1,400 large Chinook salmon as per the PST catch share agreement.

The Canadian guideline harvests in a Chinook salmon assessment fishery were based on an overall allowable catch (TAC) of 1,400 large Chinook salmon. This TAC was apportioned from SW19 through SW 25. The weekly guideline harvests were derived from historical run timing data from the 2005-2009 inriver commercial fisheries and the 2000-

2003, and 2010-2013 inriver test fisheries. In SW 25, the inseason run size estimate of 25,000 large fish resulted in opening a directed Chinook fishery, i.e. inseason estimate exceeded the Treaty prescribed inseason run size of 24,500 large Chinook salmon allowing for a directed Chinook salmon harvests. Moreover, record high CPUE in the assessment fishery appeared to support an improvement in Chinook salmon run strength as generated by a combination of a MR and model estimates. During the early component of the directed sockeye salmon fishery, when incidental Chinook salmon catches occurred, weekly guidelines of the Chinook salmon BLC (defined in the PST) were generated using the same run timing as articulated above.

The Chinook salmon assessment fishery regime commenced at 0800 hrs, 05 May (SW 19). The single directed Chinook fishery for the 2014 fishing season opened at 0800 hrs, 16 June. The sockeye salmon fishery regime (that incidentally harvested Chinook salmon allocated under the base level allocation) commenced at 1200 hrs 22 June (SW 26). Fishers were limited to one net with a maximum length of 135 metres ( 443 ft .). The maximum mesh size was 203 mm (8 inches) when targeting Chinook or coho salmon, and 140 mm (5.5inches) when targeting sockeye salmon. The fishing zone extended from the Canada/ U.S. boundary to a point near the confluence of the Porcupine and Stikine rivers and the lower 10 km reach of the Iskut River.
(Note: some of the catch figures listed in the following narrative may not match the final catch records shown in the appendix tables. This is due to slight changes in the catches as a result of a postseason check of the catch slips and assessment of Chinook salmon large versus nonlarge size ratios.)

The first Chinook salmon assessment fishery opening was posted for 6 hrs commencing at 0800 hrs 05 May, SW 19. The guideline harvest was 61 large Chinook salmon, based on a preseason run size of 26,100 and a TAC of 1,400 large Chinook salmon. Fishing conditions were poor due to rising water. The estimated harvest taken after 4 hrs of fishing indicated a harvest of only 6 large Chinook salmon. Based on this catch and a projected catch after 6 hrs of fishing, the fishery was extended 6 hrs and closed at 2000 hrs 05 May for a total fishing time of 12 hrs. The catch per boat day (C/B/D) of 4 large Chinook salmon was below average. The cumulative CPUE at the Kakwan tagging site was close to double the average, however anecdotal reports from the District 108 recreational fishery were mixed.

The fishery was posted for 12 hrs in SW 20 with a weekly guideline harvest of 197 large Chinook salmon, based on a preseason run size of 26,100 large Chinook salmon and a TAC of 1,400 . The estimated harvest after 6 hrs fishing was $<20$ fish which prompted a 14 hour extension. Another hail was collected after 14 hrs of fishing. The cumulative harvest to this point supported an additional 12 hrs of fishing. The final harvest at the close of this 36 hr . opening was 61 large Chinook salmon taken under very poor fishing conditions as a result of the rapidly rising water. The C/B/D of 4 large Chinook salmon was approximately one third of average. The cumulative CPUE at the Kakwan tagging site was only $48 \%$ of average, while the harvest to date taken by the District 108 recreational fishery was approximately $31 \%$ of average.

The fishery was posted for 24 hrs in SW 21 with a weekly guideline harvest of 398 large Chinook salmon, based on a preseason run size of 26,100 and a TAC of 1,400 large Chinook salmon Estimated catches taken at the onset of this week's fishery prompted an initial 24 hr . extension, followed by a second 24 hr . extension. The final harvest after 72 hours of total fishing time was 217 large Chinook salmon taken during poor fishing conditions. The C/B/D of 11 large Chinook salmon was below the average of 17 large Chinook salmon. The cumulative catch per hour (CPUE) at the Kakwan tagging site was $24 \%$ of average, while the harvest to date taken by the District 108 recreational fishery was approximately $81 \%$ of average.
(Note: On 20 May DFO was informed of a major rock slide that had occurred near the mouth of the Tahltan River. The Tahltan River accounts for approximately 4-050\% of Stikine River Chinook and sockeye salmon production. Officials that assessed the site in respect to fish passage suggested that the slide most probably resulted in establishing a salmon passage barrier at current flows. The effects of this environmental catastrophe was a background factor in formulating weekly management plans .

In SW 22 the fishery was posted for 24 hrs with a weekly guideline harvest of 394 large Chinook salmon, based on a preseason run size of 26,100 and a TAC of 1,400 large Chinook salmon The estimated catch at 1600 hrs was 90 fish with a projected 24 hr catch of $\sim 300$ chinook salmon.. The fishery was, therefore, held at 24 hrs. The final harvest was 291 large Chinook salmon taken under good fishing conditions (river high, but dropping). The C/B/D of 49 large Chinook salmon was well above the average of 14 large Chinook salmon. The cumulative catch per hour (CPUE) at the Kakwan tagging site, however, was only $30 \%$ of average, while the harvest to date taken by the District 108 recreational fishery was approximately $77 \%$ of average. Both Canada and U.S. decided to forego generating an inseason estimate this week. This decision was based on the uncertainty around an estimate whereby only 20 percent (on average) of the run had transited the Kakwan test/tagging site and only 3 tags were recovered in the assessment fishery to date.

In SW 23 the fishery was posted for 24 hrs with a weekly guideline harvest of 278 large Chinook salmon, based on a preseason run size of 26,100 and a TAC of 1,400 large Chinook salmon The estimated harvest at 1600 hrs was 300 large Chinook salmon and projected harvest of > 900 fish for 24 hours. An emergency order to reduce fishing time from 24 hrs to 12 hrs was invoked. The final harvest taken in this week's 12 hour fishery was 418 large Chinook salmon taken under very favourable fishing conditions. The river crested at the start of the fishery, but dropped dramatically as the fishery proceeded. The C/B/D of 109 large Chinook salmon was close to four times the average of 26 large Chinook salmon. The cumulative CPUE at the Kakwan tagging site was only 38\% of average, while the harvest to date taken by the District 108 recreational fishery was approximately $74 \%$ of average. Both Canada and the U.S. decided to resume using the preseason run size estimate given the paucity of tags recovered in the fishery ( $n=4$ ). A small Chinook salmon harvest was reported from the AF located upstream near the town of Telegraph Creek, B.C.

The fishery was posted for 12 hrs in SW 24 with a weekly guideline harvest of 212 large Chinook salmon; based on a preseason run size of 26,100 and a TAC of 1,400 large Chinook salmon The estimated harvest at 1400 hrs was $\sim 100$ large Chinook salmon with a projected 12 hr harvest of $>300$ large Chinook salmon. Consequently the fishery was held at 12 hrs. It was anticipated that this harvest coupled with tag recoveries would result in a run size estimate beyond the 25,400 fish threshold that would trigger a directed fishery. The final harvest was 418 large Chinook salmon taken under good fishing conditions as a result of receding river levels. The C/B/D of 141 large Chinook salmon was a record high for this week and close to three times above the average CPUE of 50 fish. Although the cumulative CPUE at the Kakwan tagging site was only 45 percent of average, the CPUE specific to this week was above average. The District 108 recreational fishery picked up slightly and was approximately $89 \%$ of average. The cumulative harvest of 206 fish taken in the upper Stikine River AF fishery was close to the average cumulative catch. The first inseason estimate of 25,060 large Chinook salmon was based on averaging the model and MR estimate. This number exceeded the 24,500 fish threshold estimate and, therefore, prompted a decision to open a directed Chinook fishery commencing in SW 25. The decision to open a directed fishery was also supported by record level CPUE observed in the assessment fishery. A total of 15 sockeye salmon was harvested in addition to the Chinook salmon catch. Two sockeye salmon were harvested in the upper Stikine River AF fishery.

Week 25 marked the first directed Chinook fishery for the season prompted by an inseason run size estimate of 25,030 large Chinook salmon generated in the latter part of SW 24. The fishery was posted for an initial 4 hour period with a weekly guideline harvest of 89 large Chinook salmon. The final harvest was 167 large Chinook salmon taken under exceptionally good fishing conditions. The C/B/D of 166 large Chinook salmon was a record high. The cumulative CPUE at the Kakwan tagging site, however, was only 49\% of average, while the harvest to date taken by the District 108 recreational fishery was $81 \%$ of average. The incidental CPUE in the District 108 directed drift gillnet sockeye salmon fishery was 23 large Chinook salmon, which was well above average; however, the harvest was presumed to include a large component of non-Stikine Chinook salmon. The cumulative harvest of 504 taken in the upper Stikine River AF fishery was well above the average cumulative catch; however, the harvest may have been driven by the Tahltan landslide barrier, which caused fish to drop downriver into the AF fishing grounds. This week's run size estimate of 25,030 fish did not change from the previous week. The Little Tahltan Chinook salmon weir was installed this week. As expected, no fish transited the weir, nor were any fish observed below the weir due to the probable effects of the Tahltan landslide. A total of 114 sockeye salmon was harvested in the lower Stikine River commercial fishery. Ninety-nine sockeye salmon were harvested in the upper Stikine River AF fishery.

In SW 26 the fishery management focus switched from Chinook salmon to sockeye salmon. The sockeye salmon management regime was centred on the Tahltan stock group and remained so till SW 29. The guideline harvest for Chinook salmon was based on the BLC of 1,500 large fish (and a small AC), partitioned by historical run timing through the fishery from SW 26 through to SW 30. In order to minimize the incidental harvest of

Chinook salmon, a mesh size restriction of 140 mm (5.5 inches) was implemented. Fishers were permitted one net only and the commercial fishing grounds remained the same as that defined in the Chinook salmon assessment fishery.

The first targeted sockeye salmon fishery for the 2014 season was posted for an initial one day period commencing Sunday noon, SW 26. The sockeye salmon TAC was based on the preseason run size expectation of 152,400 fish and a total TAC of 44,000 including 23,500 Tahltan Lake sockeye salmon, 8,000 Tuya Lake sockeye salmon and 12,500 mainstem sockeye salmon. In accordance with Annex IV, Chapter 1, Para 4 the Tahltan Lake sockeye salmon TAC was reduced 27 percent (11,800 fish) to better align Canada’s Treaty harvest share agreement, given that Canada exceeded its 50 percent allocation in three years over the past five years. The guideline large Chinook salmon harvest was 690 fish and the sockeye salmon guideline harvest was 1,690 fish, including 1,200 Tahltan Lake sockeye salmon. A harvest estimate of approximately 400 Tahltan Lake sockeye salmon and 70 large Chinook salmon after 8 hrs of fishing prompted a decision to hold to one day of fishing. The fleet fished under poor fishing conditions due to rapidly rising water. The one day fishery yielded a harvest of 226 large Chinook salmon, 115 nonlarge Chinook salmon, and 2,746 sockeye salmon, which was above the sockeye salmon guideline harvest. The total weekly sockeye salmon harvest was comprised of $65 \%$ Tahltan, $26 \%$ Tuya, and $9 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 166 fish vs. and the average of 43 fish. U.S. District 108 sockeye salmon catches were reported as average, whereas catches taken in District 106 were above average. The upper Stikine River AF sockeye and Chinook salmon catches were well above average. Zero Chinook salmon transited the Little Tahltan weir; Chinook salmon were building in noticeably large numbers below the Tahltan slide.

The fishery was posted for an initial two day period in SW 27 with a Chinook salmon guideline harvest of 877 large fish and a sockeye salmon guideline harvest of 8,800 fish, including 5,050 Tahltan Lake sockeye salmon. The first inseason run size estimate was generated late in SW 26. Both the SMM and the inriver regression analysis were used. The estimate indicated a run size of 190,800 sockeye salmon, including a Tahltan Lake sockeye salmon estimate of 100,000 fish. The harvest of approximately 2,200 Tahltan Lake sockeye salmon and 160 large Chinook salmon after one day of fishing indicated that there was little room to extend another day. The fishery was thus held to two days. The fishing conditions were very good due to dropping water levels. The two day fishery yielded a harvest of 279 large Chinook, 169 nonlarge Chinook, and 10,936 sockeye salmon, including 7,300 Tahltan Lake origin fish. This harvest was well below the Chinook salmon guideline harvest of 877 fish and over the Tahltan Lake sockeye salmon guideline harvest of 5,050 fish. The total weekly sockeye salmon harvest was comprised of $76 \%$ Tahltan, $15 \%$ Tuya, and $9 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 319 fish vs. an average of 113 fish. The preliminary U.S. harvest reported for District 108 this week was average. The cumulative sockeye salmon harvest in the AF fishery was 1,100 fish, well above average. The Chinook salmon harvest in the AF continued to be well above average too. As expected, no fish were observed at the Little Tahltan; the Tahltan River salmon salvage operation began this week.

In SW 28 the fishery was posted for an initial three day period with a guideline harvest of 26,000 sockeye salmon including 19,500 Tahltan Lake sockeye salmon. The run size, generated from the SMM and inriver model in SW 27, of approximately 190,000 sockeye salmon, including 100,000 Tahltan Lake origin fish, was upgraded to 269,100 fish, including 171,400 Tahltan Lake origin fish after for SW 28. Catch monitoring during days one and two showed a decrease in $\mathrm{C} / \mathrm{B} / \mathrm{D}$ in day two. It was decided, therefore, to limit the fishery to three days, i.e. anticipated a sharp decline in projected run size later in the run. The three day fishery yielded a harvest of 193 large Chinook, 116 nonlarge Chinook, 4 chum, and 7,960 sockeye salmon, including a harvest of 5,100 Tahltan Lake sockeye salmon. The Chinook salmon harvest was below the guideline harvest. The harvest of Tahltan sockeye salmon was well below the guideline harvest of 19,500 fish. The total weekly sockeye salmon harvest was comprised of $64 \%$ Tahltan, $27 \%$ Tuya, and $9 \%$ mainstem sockeye salmon. This week's Tahltan Lake sockeye salmon C/B/D of 141 fish was slightly above the average of 130 fish. Week 28 marks the historical peak of the Tahltan Lake bound sockeye salmon run through the fishery. The preliminary U.S. harvest estimates for this week indicated the CPUE was below average. The upper Stikine River AF fishery catches were four times the average; it was expected that approximately $40 \%$ of the harvest consisted of Tuya Lake origin fish. One person was active in the upper Stikine River commercial fishery this week and reported a harvest of 283 sockeye salmon. The Chinook salmon catches in upper AF fishery continued to be well above the seasonal average. The Little Tahltan weir crew had yet to register any large Chinook salmon transiting the weir. The salvage crew moved several hundred Chinook and sockeye salmon over the landslide this week; there was evidence that some fish succeeded in negotiating the landslide late in the week.

In SW 29 the fishery was posted for an initial two day opening with a guideline harvest of 18,100 Tahltan sockeye salmon. This week’s run size estimate dropped to 241,500 (based on averaging commercial CPUE model and the SMM). The Tahltan Lake component was estimated at 148,100 fish. The two day fishery yielded a harvest of 45 large Chinook, 32 nonlarge Chinook, 15 chum, and 2,978 sockeye salmon. The Tahltan Lake sockeye salmon harvest of 1,600 fish was well below the guideline harvest. Fishing time was not extended in order to maximize the number of Tahltan Lake origin sockeye salmon entering the Tahltan River and thus transiting the landslide (note: observed that fish succeeded in negotiating the landslide late in SW 28). The total weekly sockeye salmon harvest was comprised of 54\% Tahltan, 19\% Tuya, and 27\% mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 67 fish vs. the average of 93 fish. Week 29 marked the end of the Tahltan Lake sockeye salmon management regime. The balance of the sockeye salmon fishery decisions for the lower commercial fishery switched to mainstem sockeye salmon abundance and TAC considerations. The upper Stikine River AF fishery catches continued to climb to near record harvest levels. The Tahltan sockeye salmon weir crew arrived and installed the weir structure this week; the crew was assisting with the salvage operations up to this juncture. The first Chinook salmon arrived at the Little Tahltan weir this week. On average $\sim 1,100$ large Chinook salmon have passed by this date. The obvious effects of the Tahltan landslide and substandard return were apparent.

In SW 30 the fishery management focus switched from Tahltan Lake to the mainstem sockeye salmon stock grouping. The fishery was posted for an initial two day opening with a guideline harvest of 2,300 mainstem sockeye salmon. The total run size estimate dropped this week indicating a return of approximately 231,900 sockeye salmon based on the average of the SMM (commercial CPUE) and an inriver run size regression using commercial CPUE. The estimated run size of mainstem sockeye salmon was average with a prediction of 52,400 fish. The day one harvest of 1,100 sockeye salmon, including a harvest of approximately 1,000 mainstem sockeye salmon did not warrant a fishery extension. The two day fishery yielded a harvest of 18 large Chinook, 11 nonlarge Chinook, 8 coho, 17 chum, 52 pink, and 2,934 sockeye salmon, including a mainstem sockeye salmon harvest of 2,022 fish. The mainstem harvest was below the weekly guideline harvest of 2,900 sockeye salmon. The total weekly sockeye salmon harvest was comprised of $21 \%$ Tahltan, $10 \%$ Tuya, and $69 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D was 85 fish vs. an average of 58 fish, taken under very favourable fishing conditions. The upper Stikine River AF sockeye salmon catches were strong and well above average; the Chinook salmon catches in this fishery were also strong. This week's Tahltan Lake weir count of 26,000 sockeye salmon was close to record. It appeared that at the current Tahltan River flow regimes, the landslide did not serve as a major barrier to sockeye salmon migration. The Little Tahltan cumulative weir count of 63 fish continued to lag well behind the seasonal average of approximately 2,500 large Chinook salmon. The Tahltan salvage operation terminated this week on Saturday, 26 July.

In SW 31 the fishery was posted for an initial two day opening with a guideline harvest of 2,100 mainstem sockeye salmon. The run size projection dropped to 231,100 sockeye salmon based on an average of the inriver commercial CPUE regression and the SMM. The mainstem projection of 52,200 fish was close the preseason expectation. The day one harvest of 640 and $\mathrm{C} / \mathrm{B} / \mathrm{D}$ of only $26 \mathrm{c} / \mathrm{b} / \mathrm{d}$ mainstem sockeye salmon resulted in a decision to hold the fishery to two days. The two day fishery yielded a harvest of 6 large Chinook, 2 nonlarge Chinook, 8 coho, 129 chum, and 999 sockeye salmon (including 700 mainstem fish; well below the guideline harvest of 2,100 fish). The total weekly sockeye salmon harvest was comprised of $27 \%$ Tahltan, $5 \%$ Tuya, and $68 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D of $26 \mathrm{c} / \mathrm{b} / \mathrm{d}$ was well below the average $71 \mathrm{c} / \mathrm{b} / \mathrm{d}$. The upper Stikine River AF sockeye salmon effort dropped substantially. The Tahltan weir cumulative count was 35,000 compared to an average of 21,000 fish. The cumulative count of large Chinook salmon at the Little Tahltan weir remained low at only 164 fish compared to an average of 3,200 large Chinook salmon.

In SW 32 the fishery was posted for an initial two day opening with a guideline harvest of 3,700 mainstem sockeye salmon. The TAC was based on a run size projection of 53,500 mainstem sockeye salmon generated from averaging the SMM and inriver regression model. The day one harvest of 531 mainstem sockeye salmon and the drop in effort (three licenses left the fishery) prompted a one day extension. The three day fishery for this week yielded a harvest of 5 large Chinook, no nonlarge Chinook, 129 coho, no chum or pink, and 1,438 sockeye salmon, including a mainstem sockeye salmon harvest of 1,173 fish, which was below the guideline harvest by 3,700 fish. The total weekly sockeye salmon harvest was comprised of $13 \%$ Tahltan, $5 \%$ Tuya, and $82 \%$ mainstem sockeye salmon.

Only nine licenses fished this week. The mainstem sockeye salmon C/B/D was 43 fish vs. the average of 59 fish. The Tahltan cumulative weir count to date of 38,362 fish was well above the seasonal average. Effort in the upper Stikine River AF fishery was weakwith only one or two nets fishing during the course of the week.

In SW 33 the fishery was posted for an initial two day opening with a guideline harvest of 3,100 mainstem sockeye salmon. The TAC was based on a run size projection of 51,700 mainstem sockeye salmon generated from inriver regression models and the SMM. The effort dropped significantly to only four licences. The two day fishery yielded a harvest of 24 coho and 67 sockeye salmon, including a mainstem sockeye salmon harvest of 58 fish. The total weekly sockeye salmon harvest was comprised of $13 \%$ Tahltan, $0 \%$ Tuya, and $87 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D was 43 fish vs. the average of 59 fish. Fishing conditions were very poor with river flows approaching record high levels. Effort in the upper Stikine River AF continued to drop this week. The Tahltan weir count to date was 39,312 fish. The Little Tahltan weir projected ended on 09 August. The final count was 169 large fish and 39 nonlarge Chinook salmon. The record low count was well below the escapement goal of 3,300 large Chinook; indeed, it was below the lower end of the escapement goal range of 2,700 to 5,300 large Chinook salmon.

In SW 34 the fishery was posted for an initial two day opening. The run projection, based on averaging the SMM and the inriver CPUE model, dropped to 45,400 mainstem sockeye salmon, with a weekly harvest guideline of 382 fish. The two day fishery yielded a harvest of 248 coho and 146. 137 of which were mainstem sockeye salmon. The total weekly sockeye salmon harvest was comprised of $6 \%$ Tahltan, no Tuya, and $94 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D was 9 fish, while the average was 14 fish. No fishing was conducted in the upper Stikine River AF this weekIt was presumed that the fishery finished for the season. The Tahltan Lake weir count as of this week was 40,104 fish, well above the escapement goal range of 18,000 to 30,000 sockeye salmon.

In SW 35 the fishery was opened for an initial three day period with the management objective focused on coho salmon. A total of 11 licensed fishers were active (i.e. 7 commercial fishers returned to harvest coho salmon). The guideline harvest on coho salmon was 5,000 fish for the season including a 2,500 guideline harvest for this week. The CPUE in both the commercial and test fisheries leading up to this opening indicated a relatively strong return of coho salmon. After two days of fishing and a harvest of 1,000 coho salmon the fishery was extended two days. The five day fishery yielded a harvest of 2,278 coho, 13 chum, and 200 sockeye salmon, $96 \%$ if which were mainstem sockeye salmon. The fishing conditions were very good; the coho salmon CPUE was above average.

In SW 36 the fishery was opened for an initial three day period with a guideline harvest of 2,722 fish ( 5000 minus 2,278). A total of 11 licensed fishers were active in this week's fishery. After two days of fishing and a harvest of 1,400 coho salmon that indicated there was room to consider more fishing time, the fishery was extended one day. The four day fishery yielded a harvest of 2,714 coho, 6 chum, and 68 ( $96 \%$ mainstem) sockeye salmon, $96 \%$ of which were mainstem sockeye salmon. The fishing conditions remained good; the
coho salmon C/B/D was above average. The final day of the 2014 fishing season was 4 September. The final coho salmon harvest was 5,409 fish; 417 fish were taken in the course of the sockeye salmon fishery and, therefore, not counted toward the 5,000 fish allocation as prescribed by the PST.

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. A total of 548 sockeye salmon was caught in 2014, which was below the average. There were no Chinook salmon harvested in 2014. The fishing effort of 4 boat days fished was well below average. The principal commercial fisherman was engaged in the Tahltan salvage operation for most of July. Generally, fishery openings were based on the lower Stikine River commercial fishery openings, lagged one week. The first opening, however, was concurrent with the lower Stikine River commercial fishery opening.

## Aboriginal Fishery

The upper Stikine River AF fishery, which is located near Telegraph Creek, B.C., harvested 1,020 large Chinook, 103 nonlarge Chinook and 9,951 sockeye salmon in 2014. The harvest of all species was well above average. The harvest of sockeye salmon was a record catch, assumed to be driven by the above average run size, good fishing conditions, increased effort, and most probably by the effects of the Tahltan landslide (harvest of early drop out of sockeye and Chinook salmon from the Tahltan River blockage during high flow regimes).

## Recreational Fishery

The Stikine River salmon recreational fishery targets primarily Chinook salmon and its principal fishing location is located at the mouth of the Tahltan River. Minor sport fishing activities occur in upper reaches of the Tahltan River and in some tributaries of the Iskut River, including Verrett and Craig rivers. In 2014 the harvest estimate was 50 large Chinook salmon. All of the fish were taken in the Telegraph Creek area. Access to the fishing sites near Tahltan was restricted by the Tahltan First Nation Chief and Council in order to limit recreational harvest on Little Tahltan bound Chinook salmon. The overall harvest most probably exceeded 50 fish; however, many fish were donated to the Tahltan salvage crew for transport over the landslide barrier.

## Escapement

## Sockeye Salmon

A total of 40,145 sockeye salmon was counted through the Tahltan Lake weir in 2014, 30\% above average of 30,990 fish and well above the escapement goal range of 18,000 to 30,000 fish. An estimated 17,400 fish ( $48 \%$ of spawners) originated from the fry-stocking program, which was above the $41 \%$ contribution observed in smolts leaving the lake in 2011, the principal smolt year contributing to the 2014 return. A total of 2,881 sockeye salmon was collected for broodstock and 400 fish were collected for stock identification purposes, resulting in a spawning escapement of 36,864 sockeye salmon in Tahltan Lake. It was estimated that the Tahltan landslide resulted in approximately $9 \%$ mortality to the Tahltan Lake bound sockeye salmon return; however it was also estimated that the Stikine River AF fishery harvested about 476 Tahltan Lake bound fish, slightly reducing the overall mortality.

The final inseason SMM model estimate (SW 31) of 121,240 inriver Tahltan Lake sockeye salmon, minus the inriver harvest of 26,430 fish, resulted in a projected escapement 101,064 Tahltan fish, well above the postseason estimate of 40,125 fish. The final inseason estimates using "other" management tools including the regression model that generates inriver Tahltan Lake sockeye salmon run size and Tahltan escapement from Tahltan sockeye salmon CPUE (commercial CPUE) in concert with the SMM, generated an escapement of 114,570 sockeye salmon: well above the postseason estimate.

The spawning escapements for the mainstem and Tuya stock groups are calculated using stock identification, test fishery and inriver commercial harvest data. Based on this run reconstruction approach, the mainstem sockeye salmon escapement estimate was 21,179, below the target escapement of 30,000 fish, but within the escapement goal range of 20,000 to 40,000 fish. The Tuya escapement estimate was 20,970 sockeye salmon, which was well above average. No inriver sampling of Tuya River sockeye salmon occurred in 2014. Aerial survey counts of mainstem sockeye salmon were slightly above average.
The sixth year of a test fishery designed to harvest Tuya River sockeye salmon at a site on the mainstem Stikine River located between the mouths of the Tahltan and Tuya rivers was conducted from 27 to 31 July, 2014. (Unlike past years, the 2013 and 2014 project was commissioned and overseen by the Tahltan First Nations.) The total harvest from the test fishery was 833 sockeye, 19 large Chinook, and 5 nonlarge Chinook salmon. The estimated harvests by stock groupings based on stock identification thermal mark analysis results were 424 (48\%) Tuya Lake origin, 433 (49\%) Tahltan Lake origin, and 26 (3\%) mainstem origin sockeye salmon. The harvest rate on Tuya sockeye salmon was estimate at approximately $2 \%(424 / 21,394)$. To date it appears that this fishery succeeds in targeting primarily Tuya River bound sockeye salmon (long term proportion of Tuya is 70\%). Moreover, the limited incidental harvest of Chinook salmon is minor, which suggests this fishery may be advantageous to pursue in maximizing catches of Tuya bound sockeye salmon that escaped approach water fisheries. It should be noted that the fishing conditions are very challenging due to high river velocities. It is highly recommended that fishing at this fishery be limited to persons with extensive experience in both net fishing and river navigation.

## Chinook Salmon

The 2014 Chinook salmon escapement enumerated at the Little Tahltan River weir was 169 large fish and 39 nonlarge Chinook salmon. The escapement of large Chinook salmon in the Little Tahltan River was well below the average of 3,751 fish and below the Canadian escapement goal for this stock of 3,300 large Chinook salmon. The weir count was also well below the lower end of the Canadian escapement goal range of 2,700 to 5,300 large fish. This is the eighth consecutive year that the lower end of the Canadian escapement goal was not reached. This year's return, however, was affected by the Tahltan River landslide. Canadian estimates indicate that approximately 70\% of Little Tahltan River Chinook failed to reach their spawning grounds located upstream of the Tahltan River landslide.

A MR study was conducted again in 2014 concurrent with the SCMM to assess the inriver Chinook salmon abundance. Inseason MR estimates were calculated weekly from SW 24 to SW 29. The final postseason Stikine River spawning escapement, based on tag recoveries from the commercial fishery, spawning ground recoveries, and recoveries observed during the Tahltan River landslide project was 24,366 large Chinook salmon, 7\% above the average escapement of 22,715 , and within the escapement goal range of 14,000 to 28,000 large Chinook salmon. Canadian estimates indicate that approximately 9,000 Tahltan River Chinook salmon failed to enter their natal spawning sites located above the Tahltan River landslide. The total effective escapement, which accounts for the 9,314 large Chinook salmon that failed to pass the Tahltan landslide, equates to 15,225 fish. This escapement was close to the escapement goal of 17,400 large Chinook salmon. (The escapement counted past the Little Tahltan River weir represented less than $1 \%$ of the total Stikine River escapement. The percentage is below the average weir count contribution of approximately $14 \%$. Past management actions to change the downward trend, including late commercial openings, reducing the TAC by $30 \%$ until an inseason estimate is generated (usually 3-4 weeks into the fishery), and reducing the gillnet mesh size during the sockeye salmon fishery to limit the incidental harvest of Chinook salmon has not resulted in significant improvements to Chinook salmon spawning abundance in the Little Tahltan River.

Stikine River Chinook salmon run timing to the Lower Stikine River commercial fishing grounds was normal. Passage above Little Tahltan River weir was later than average, presumably due to the Tahltan River landslide. Verrett Creek escapements counts could not be estimated due to high turbid water. The carcass pitch crew stationed at the creek from 05-09 August sampled a below average number of Chinook salmon; the crew characterized the run as "low in numbers". An average run of Shakes Creek Chinook salmon was reported by residents living at the creek mouth.

## Coho Salmon

The annual coho salmon aerial survey was conducted on 05 November under fair to good viewing conditions. The total count of coho salmon observed at six index sites was 1,195 fish; $56 \%$ below average. Given the above average harvests observed in the U.S. gillnet fishery, the lower Stikine River commercial fishery, and the incidental coho salmon harvest taken in the lower Stikine River sockeye salmon test fishery, it was expected that the survey counts would have followed suit and be above average. Reasons for the relative weak showing of spawners at the coho salmon spawning index sites cannot be explained.

A coho salmon drift gillnet test fishery was not conducted in 2014 due to budgetary constraints.

## Sockeye Salmon Run Reconstruction

The final postseason estimate of the terminal Stikine River sockeye salmon run size was 153,323 fish. Of this number, approximately 78,206 were of Tahltan Lake origin (wild \& enhanced), 37,945 were of Tuya origin (fry from Tahltan broodstock stocked into Tuya Lake), and 37,172 were mainstem (Table 3). These estimates are based on postseason data, including otolith recovery and GSI analysis in the U.S. Districts 106 and 108 harvests. For inriver estimates they are based on inseason and postseason otolith analysis: egg diameter stock-composition estimates for inriver harvest from the Canadian commercial, Aboriginal, ESSR, and test fishery harvests, and escapement data. The 2014 total run was below average, but slightly above the preseason forecast of 152,400 fish.

## TAKU RIVER

Taku River salmon are harvested in the U.S. gillnet fishery in Alaskan District 111, in the northern Southeast Alaska seine and troll fisheries, in the Juneau area sport fishery, and in the inriver personal use fishery. Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an AF, and a sport fishery (Figure 2).

Figure 2. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Regulations

Fishing arrangements in place as a result of Annex IV, Chapter 1 of the PST can be found at: http://www.psc.org/pubs/treaty.pdf. For salmon originating in the Canadian portion of the Taku River watershed, these arrangements include the continuation of directed fisheries for Taku River Chinook salmon stocks, first implemented in 2005; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the production of enhanced fish.

## U.S. Fisheries

The traditional District 111 commercial drift gillnet salmon fishery was open for a total of 65 days from June 15 through October 10, 2014. The harvest totaled 1,465 Chinook, 109,723 sockeye, 53,899 coho, 29,182 pink, and 291,355 chum salmon. Harvest of coho salmon was above average, while harvests of all other salmon species were below average.

Hatchery stocks contributed substantially to the total harvest of both sockeye and chum salmon and more minimally to the harvest of other species. The 2014 season was the fifteenth year of adult sockeye salmon returning to the Snettisham Hatchery inside Port Snettisham. These fish contributed to the traditional harvests in Taku Inlet and Stephens Passage, and made up nearly the entire common property harvest in the Speel Arm SHA inside Port Snettisham which was initially opened to fishing during SW 35 to target Snettisham Hatchery sockeye salmon.

A bilateral review of the escapement goal for Taku River large Chinook salmon completed in early 2009 resulted in a revised escapement goal range of 19,000 to 36,000 fish. The adjusted 2014 preseason terminal run forecast of 26,800 Taku River large Chinook salmon provided no AC for either country. A modified inriver Chinook salmon assessment fishery was proposed this season with the goal of reducing the number of fish killed sampling for tags. Increased tagging in the U.S. portion of the river using drifted tangle nets, in combination with the Canyon Island fish wheels, was expected to reduce the amount of Chinook salmon needed to be sampled in the assessment/test fishery to produce a reliable estimate. Due to a low final inseason Chinook salmon estimate, the first District 111 gillnet sockeye salmon opening (SW 25) had conservation measures implemented including a 6 inch maximum mesh size restriction, fishing time reduced to two days, and an area restriction closing the mouth of the Taku River. In SW 26, Chinook salmon conservation measures were limited to the area restriction used the previous week to protect fish milling off the river mouth. The 2014 District 111 drift gillnet Chinook salmon harvest in SWs 25 through 28 was 1,144 fish of which $67 \%$ were large fish. Postseason GSI analysis indicates Alaskan hatchery Chinook salmon contributed at least 257 large fish, or $34 \%$ of the drift gillnet harvest during the accounting period. The Juneau area sport harvest of Taku River large Chinook salmon was estimated at 714 fish during the accounting period based on GSI analysis. The final MR estimate of Taku River spawning escapement is 23,532 large Chinook salmon.

The traditional District 111 sockeye salmon harvest was 109,732 fish and was below average. Weekly sockeye salmon CPUE was generally near or above average in 2014
through SW 36 with the opening of the entrance to Port Snettisham in SW 33 resulting in above average harvest and CPUE of predominantly Snettisham Hatchery fish in the latter part of the sockeye salmon management period and into the coho salmon management period. Domestic hatchery sockeye salmon stocks began to contribute to the traditional fishery in SW 26 and added substantially to harvests in SWs 28-34. Of the total traditional District 111 sockeye salmon harvest, 53\% occurred in Stephens Passage and Port Snettisham; above the average of $44 \%$. The contributions of wild Taku River, enhanced Taku River, enhanced Port Snettisham, and other sockeye salmon stocks were estimated inseason from analysis of otoliths and postseason from GSI analysis. The final estimated stock composition of the harvest of sockeye salmon in the traditional fishery was 30,675 (36\%) wild Taku River, 859 (1\%) enhanced Tatsamenie and 37,876 (45\%) Snettisham Hatchery fish.

Table 4. Taku River sockeye salmon run reconstruction, 2014. Estimates do not include spawning escapements below the U.S./Canada border.

Opportunity to harvest Snettisham Hatchery sockeye salmon inside Port Snettisham began in SW 33 as one-third of the minimum escapement goal range had passed through the weir located at the outlet of Speel Lake and there was an obvious abundance of fish in the head of Speel Arm. In SWs 33 and 34, the entrance to Port Snettisham was opened concurrently with the rest of the district, and in SW 35 the Speel Arm SHA was opened as the minimum of the 4,000 to 13,000 fish escapement goal range for Speel Lake was reached. The Speel Arm SHA opened concurrently with the traditional fishery in SWs 35 through 38.

The traditional District 111 chum salmon harvest of 291,355 fish was just over half the average of 533,757 fish. The summer chum salmon harvest of 288,300 fish was $99 \%$ of the
season's total chum salmon harvest. The summer chum salmon run is considered to last through mid-August (SW 33) and was comprised mostly of domestic hatchery fish, with small numbers of wild fish contributing to the harvest. Chum salmon returns to DIPAC release sites in Gastineau Channel and Limestone Inlet contributed a major portion of the harvest but quantitative contribution estimates were not available. Approximately $63 \%$ of the total traditional District 111 chum salmon harvest occurred in Taku Inlet and 36\% in Stephens Passage. The harvest of 3,000 fall chum salmon, from SW 34 and later, was 64\% of the 4,700 fish average fall chum salmon harvest. Most of these chum salmon are assumed to be wild fish of Taku and Whiting rivers origin.

The District 111 pink salmon harvest of 29,182 fish was $19 \%$ of average.
Coho salmon stocks harvested in District 111 include runs to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams as well as Alaskan hatcheries. The traditional District 111 coho salmon harvest of 53,899 fish was $140 \%$ of the average of 38,625 fish. CWT analyses indicate Alaskan hatchery coho salmon contributed 4,000 fish or 7\% of the traditional District 111 harvest.

Management of the District 111 drift gillnet fishery is based on wild sockeye salmon abundance in SWs 25-33 and on coho salmon abundance in SWs 34-42. The 2014 fishery began in SW 25. Management actions were limited to imposing restrictions in time, area, and gear. Because there is no bilaterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fish wheel catches. As the fishing season progresses sufficient data is acquired to estimate the inriver run size from the inriver MR program using the Canyon Island fish wheels and the inriver fishery, and to use that estimate in conjunction with migratory timing and historical fishery harvest data to forecast the entire Taku River sockeye salmon run. In the first week of sockeye salmon management starting June 15, Section 11-B was open for 2 days with the north line restricted to the latitude of Jaw Point and a 6 inch maximum mesh size was imposed to conserve Chinook salmon. Thirty-four boats harvested 477 Chinook salmon. Based on inseason CWT data 294 were Taku River large fish. The sockeye salmon harvest was $94 \%$, and the CPUE was $106 \%$ of average.

In SW 26, Section 11-B was opened for three days due to a large inseason sockeye salmon estimate (SW 25 above border projection was 134,550 fish), above average harvest rates, and a below average fleet size. Thirty-six boats harvested 286 Chinook salmon of which 138 were estimated to be Taku River large fish using inseason CWT data. The sockeye salmon harvest was $61 \%$ and the sockeye salmon CPUE was $90 \%$ of average. The inseason terminal run projection generated in SW 26 was 168,600 Taku River sockeye salmon.

Fishing time for SW 27 was set for an average three days in Section 11-B. It was extended one extra day, for a total of four days of fishing, due to a below average number of boats fishing that were primarily targeting summer chum salmon using larger mesh nets; above average sockeye salmon harvest rates from daily surveys; and a large above border sockeye salmon run projection. Effort increased to 61 boats which harvested 212 Chinook salmon, 137 of which were Taku River large fish based on inseason CWT data. Sockeye salmon
harvest and CPUE were respectively $95 \%$ and $90 \%$ of average. The first significant contributions of Snettisham Hatchery sockeye salmon were seen this week making up 12\% of the Stephens Passage harvest and $7 \%$ of the Taku Inlet sockeye salmon harvest according to otolith analysis. The weekly estimate of sockeye salmon run size projected a terminal run of 173,500 sockeye salmon.

Table 5. U.S. inseason forecasts of terminal run size, total allowable catch, inriver run size, and the U.S. harvest of wild Taku River sockeye salmon for 2014.

|  | Inriver <br> Wun | Terminal <br> Run | Total <br> TAC | U.S. <br> TAC | Projected <br> U.S. harvest |
| :--- | :---: | :---: | :---: | :---: | :---: |
| 25 | 11,706 | 189,077 | 114,077 | 87,839 | 53,025 |
| 26 | 15,997 | 169,180 | 94,180 | 72,519 | 52,594 |
| 27 | 23,807 | 173,125 | 98,125 | 75,556 | 56,622 |
| 28 | 38,213 | 176,006 | 101,006 | 79,795 | 59,630 |
| 29 | 42,703 | 144,435 | 69,435 | 54,854 | 42,717 |
| 30 | 59,714 | 152,206 | 77,206 | 61,765 | 41,214 |

| 32 | 95,819 | 146,131 | 71,131 | 56,194 | 32,481 |
| 33 | 96,662 | 142,022 | 67,022 | 53,618 | 36,332 |
| 34 | 97,176 | 135,580 | 60,580 | 48,464 | 33,490 |
| 35 | 104,895 | 141,962 | 66,962 | 53,570 | 34,394 |

${ }^{\text {a }}$ Terminal run does not include any marine harvest of Taku River salmon that might occur outside of District 111.

Fishing time for SW 28 was set for three days in Section 11-B and was again extended for one extra day for a total of four days of fishing. A strong projection, sizable remaining U.S. sockeye salmon AC, and a small fleet targeting sockeye salmon warranted an extra day of fishing. A 6 inch minimum mesh size restriction was imposed south of Circle Point to conserve wild Port Snettisham sockeye salmon stocks transiting the area while allowing opportunity to harvest enhanced DIPAC chum salmon returning to the area. Effort was the highest of the season with 107 boats harvesting 169 Chinook salmon, 119 of which were Taku River large fish based on inseason CWT data. The total District 111 gillnet harvest of Taku River large Chinook salmon for the Chinook salmon accounting period, SWs 1828, was 688 fish based on inseason CWT data, and is 488 fish based on postseason GSI analysis. Sockeye salmon harvest and CPUE were $133 \%$ and $88 \%$ of their respective averages. Otolith analysis revealed that $19 \%$ of the sockeye salmon harvest from Taku Inlet, and $57 \%$ from Stephens Passage, were of Snettisham Hatchery origin. The weekly estimate of sockeye salmon terminal run size was projected at 178,200 sockeye salmon.

Fishing time for SW 29 was set for three days in Section 11-B. Extra fishing time was not considered because of a 20,000 fish reduction in the weekly inriver sockeye salmon run projection, and the possibility of fish being pushed downstream into the marine fishery due to a large Tulsequah River flood event. The 6 inch minimum mesh size restriction remained in place south of Circle Point. Effort decreased to nearly half the average with 60 boats making landings. The sockeye salmon harvest was $63 \%$ of average while sockeye salmon CPUE was $95 \%$ of average. Otolith analysis revealed that $30 \%$ of the sockeye salmon
harvest from Taku Inlet, and 37\% from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin contributed 1\% and 3\% to the harvest in Taku Inlet and Stephens Passage, respectively. The Stephens Passage enhanced Tatsamenie sockeye salmon contribution this week was the largest of the season. The weekly sockeye salmon estimate projected a terminal run of 157,100 sockeye salmon.

Fishing time for SW 30 was set for three days in Section 11-B. The 6 inch minimum mesh size restriction remained in place south of Circle Point. Effort increased to 85 boats but remained below average. Sockeye salmon harvest was $92 \%$ of average while sockeye salmon CPUE was $115 \%$ of average. The beginning of wild Port Snettisham sockeye salmon escapements into Speel and Crescent lakes was observed by weir counts and aerial surveys this week. Otolith analysis revealed that $37 \%$ of the sockeye salmon harvested in Taku Inlet and 65\% of the harvest in Stephens Passage were of Snettisham Hatchery origin. TBR enhanced Tatsamenie Lake origin sockeye salmon contributed $2.5 \%$ and $1 \%$ to Taku Inlet and Stephens Passage harvests, respectively. The weekly sockeye salmon estimate projected a terminal run of 147,600 fish.

Fishing time for SW 31 was set for three days in Section 11-B. It was extended for one extra day, for a total of four days of fishing, due to the Taku sockeye salmon inriver estimate indicating current escapement past all fisheries was above the lower bound of the goal range, a small fleet particularly in Taku Inlet, and Snettisham Hatchery sockeye salmon making up approximately $70 \%$ of the total sockeye salmon harvest throughout District 111. The 6 inch minimum mesh size restriction remained in place south of Circle Point. Effort declined to 74 boats, and sockeye salmon harvest and CPUE were $56 \%$ and $63 \%$ of their respective averages. Otolith analysis indicated that $71 \%$ of the sockeye salmon harvest from Taku Inlet and Stephens Passage were of Snettisham Hatchery origin, and TBR enhanced Tatsamenie Lake origin sockeye salmon contributed less than $1 \%$ of the Taku Inlet and Stephens Passage harvest. The weekly sockeye salmon estimate projected an increase in the terminal run to 158,800 fish.

Fishing time for SW 32 was set for three days in Section 11-B. It was extended one day, for a total of four days of fishing, due to a small fleet especially in Taku Inlet, Taku sockeye salmon escapement was projected to be above the upper end of the goal range, and a U.S. Taku River sockeye salmon AC was well above the harvest to date. Effort declined again to 64 boats and the shift to the lower portion of Section 11-B to target returning Snettisham Hatchery sockeye salmon was substantial with the percentage of the fleet fishing in Taku Inlet falling from $55 \%$ to $36 \%$ to $17 \%$ on days one, two, and three, respectively. The 6 inch mesh restriction south of Circle Point was rescinded this week as wild sockeye salmon abundance in Speel and Crescent lakes had been steadily increasing and historical run timings suggested the bulk of these runs were through the open area. Sockeye salmon harvest and CPUE for the week were $76 \%$ and $95 \%$ of their respective averages. Otolith analysis indicated that $66 \%$ of the sockeye salmon harvest from Taku Inlet and $78 \%$ from Stephens Passage were of Snettisham Hatchery origin. TBR enhanced Tatsamenie Lake origin fish accounted for $1.5 \%$ of the Taku Inlet harvest and less than $1 \%$ of the Stephens Passage harvest. Coho salmon harvest and CPUE were $129 \%$ and $148 \%$ of their averages,
respectively. The weekly sockeye salmon terminal run projection decreased from the previous week to 148,800 fish.

Fishing time for SW 33 was set for three days in Section 11-B, with the opening delayed until Monday to accommodate the Golden North Salmon Derby taking place in Juneau area waters. The entrance to Port Snettisham was opened to allow increased opportunity to target Snettisham Hatchery sockeye salmon, and 90 boats made landings. The largest amount of effort observed on daily surveys fishing in Taku Inlet this week was sixteen boats. With less than half of the minimum escapement goal of wild sockeye salmon through the Speel Lake weir and high water delaying fish passage, it soon became obvious that an SHA opening was not likely and effort decreased in the latter portion of the opening. The sockeye salmon harvest was $104 \%$ of average, while sockeye salmon CPUE was $120 \%$ of average. Otolith analysis indicated $90 \%$ of the sockeye salmon harvest from Stephens Passage/Port Snettisham was of Snettisham Hatchery origin. Coho salmon harvest and CPUE were $94 \%$ and $81 \%$ of their respective averages. The weekly sockeye salmon terminal run projection fell slightly to 145,300 fish.

The fall drift gillnet season in District 111 lasted eight weeks, beginning on August 17 in SW 34, and lasting until October 10 in SW 41. During this time, management focus switches from sockeye to coho salmon abundance. Fishing time in Section 11-B during SW 34 was set at three days with an above average fleet size and mixed Taku River coho salmon inriver indicators. Most of the fleet was targeting enhanced Snettisham Hatchery sockeye salmon in the southern portion of Section 11-B. Effort declined to 54 boats, 111\% of the average for the week with less than $25 \%$ of boats fishing in and around Taku Inlet. Even with minimal targeting of coho salmon, harvest and CPUE for the week was $143 \%$ and $134 \%$ of their respective averages. The sockeye salmon harvest was $205 \%$ of average while sockeye salmon CPUE was $256 \%$ of average. Otolith analysis indicated $96 \%$ of the sockeye salmon harvest from Taku Inlet was of Snettisham Hatchery origin. This was the last week of sockeye salmon otolith sampling for the season. The weekly sockeye salmon estimate projected a terminal run of 138,800 fish. The initial estimate of coho salmon abundance produced this week projected an inriver run of 110,800 fish.

Section 11-B was opened for three days in SW 35 with Speel Arm SHA opening for two days. The Speel Arm SHA was extended for one more day to match the traditional area opening of three days. An above average fleet of 68 boats made landings this week with most effort starting in the Speel Arm SHA and then dispersing to the rest of the district after the first day. The first bilateral inseason Taku River coho salmon estimate projected an inriver run of 154,400 fish and was substantiated by above average harvest rates in the Canyon Island fish wheels and the Canada commercial fishery. Coho salmon harvest and CPUE in the traditional area of District 111 were $86 \%$ and $79 \%$ of their respective averages. Sockeye salmon harvest and CPUE in the traditional fishery were $189 \%$ and $176 \%$ of their respective averages.

Fishing time in SW 36 was set for four days in Section 11-B with continued high Taku River coho salmon abundance projected. The Speel Arm SHA was opened for the same duration as the traditional fishery and received minimal effort. This week was the first
opening of the season where effort predominantly targeted coho salmon and the 44 boats fishing matched the average. The coho salmon harvest was $127 \%$ of average while CPUE was $107 \%$ of average. The weekly Taku River coho salmon inriver run projection fell slightly to 147,100 fish. The inriver estimate for this week, the midpoint in historical run timing, was estimated to be approximately 75,000 fish, equal to the U.S. above border coho salmon management objective for the season.

Fishing time in SW 37 was set for five days in Section 11-B based on above average Canyon Island fish wheel coho salmon catches, District 111 gillnet coho salmon harvest rates, troll coho salmon harvest salmon rates in Northern SEAK, and coho salmon weir counts at Speel Lake. The Speel Arm SHA was open concurrently with Section 11-B attracting minimal effort. Effort increased in the traditional fishery to 53 boats with the coho salmon harvest $286 \%$ of average while coho salmon CPUE was $140 \%$ of average. The weekly Taku River coho salmon inriver run projection fell slightly again to 143,900 fish.

Fishing time in Section 11-B was again set for five days in SW 38. Effort fell to 39 boats, $148 \%$ of average. The Speel Arm SHA was opened for the last time this season and had no effort. Coho salmon harvest and CPUE were $168 \%$ and $99 \%$ of their respective averages. The weekly Taku River coho salmon inriver run projection fell to 140,700 fish with 103,800 fish estimated to be currently above border.

For the remaining three weeks of the season, Section 11-B was open for an above average 15 days of total fishing time with five-day openings each week. Effort was slightly above average in SW 39 and fell to half of average in SWs 40 and 41. Coho salmon harvest was above average in SW 39 and below average in SWs 40 and 41 while CPUE was below average for all three weeks.

The District 111 fall chum salmon harvest in SWs 34-41 was 64\% of average. Escapement numbers for Taku River chum salmon are unknown; however, the number of fall chum salmon caught by the fish wheels at Canyon Island was used as an index of escapement. The 2014 fish wheel catch of 310 chum salmon was $105 \%$ of average.

The District 111 traditional drift gillnet pink salmon harvest of 29,200 fish was $19 \%$ of average. The escapement number to the Taku River is unknown; however the number of pink salmon caught by the fish wheels at Canyon Island was used as an index of escapement. The total of 2,436 pink salmon caught in the fish wheels was $42 \%$ of the 2012 parent-year and $18 \%$ of the 1994 to 2012 even-year average.

Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2014. A number of Chinook salmon stocks are known to contribute to the Juneau area sport fishery, including those from the Taku, Chilkat, and King Salmon rivers, as well as local hatchery stocks, but the major contributor of large, wild mature fish is believed to be the Taku River. Of the Chinook salmon harvested, 714 fish were estimated to be of Taku River origin through SW 28 based on postseason GSI analysis. Personal use permits were used to harvest an estimated 1,500 Taku River sockeye salmon along with an estimated
incidental harvest of 21 Taku River large Chinook salmon. Common property purse seine fisheries were conducted in the Amalga Harbor SHA in District 111 northwest of Juneau for the third consecutive season in order to target returning DIPAC enhanced summer chum salmon. There were four total openings in 2014, occurring on Thursdays in July, each lasting 6 hrs. Postseason GSI analysis estimated a total of 536 wild Taku River and 26 enhanced Tatsamenie sockeye salmon were harvested during these openings.

## Canadian Fisheries

The Taku River commercial fishery harvest was 1,041 large Chinook (greater than 660 mm MEF, mostly 3 -ocean or older), 579 nonlarge Chinook, 17,645 sockeye, and 14,464 coho salmon in 2014). Sockeye salmon originating from the stocking of Taku fry contributed an estimated 462 fish to the catch, comprising $2.6 \%$ of the total commercial sockeye salmon harvest. The harvest of large Chinook salmon was below the average and nonlarge Chinook salmon was near average. In 2005, as a result of the Chinook salmon agreement which allows directed Chinook salmon fishing if abundance warrants, harvest accounting for nonlarge salmon was revised from a commercial weight-based designation (previously referred to "jacks" which were typically fish under 2.5 kg or 5 kg , depending on where they were being marketed), to a length-based designation ("nonlarge" Chinook salmon i.e. less than 660 mm in length MEF). Hence, comparisons with catches prior to 2005 should be viewed, accordingly. The harvest of sockeye salmon was below average and the coho salmon harvest was well above average. There were 53 days of fishing; below the average. The seasonal fishing effort of 437 boat days was above average. As is typical, both set and drift gillnets were used, with the majority of the harvest in drift gillnets. A total of 201 large and 10 nonlarge Chinook salmon were harvested in a directed Chinook salmon fishery. The maximum allowable mesh size was 20.4 cm ( 8.0 inches) except for the period of June 15 to July 5, at which time it was reduced to 14.0 cm ( 5.5 inches) to minimize the incidental harvest of Chinook salmon.

In addition to the commercial fishery catches, 112 Chinook, 219 sockeye, and 104 coho salmon were harvested in the AF. All but 40 of the Chinook salmon were harvested in the commercial fishing area on the lower river with the remainder from the Nakina River. Based on commercial harvest data, it is estimated that 56 of the Chinook salmon caught on the lower river were large and 16 were nonlarge; the Nakina River harvest is assumed to have been large fish only. On average, 171 Chinook, 140 sockeye and 166 coho salmon are harvested annually in the AF.

A test fishery to capture coho salmon for stock assessment purposes took place starting September 14 through October 11 (SWs 38-41). The fishery landed 2,000 coho and 5 sockeye salmon.

Recreational harvest figures are not available, but as in recent years it is assumed that about 105 large Chinook salmon were retained in this fishery. The catches of other salmon species are again believed to have been negligible.

The bilateral preseason forecast for the Taku River Chinook salmon terminal run was 26,800 large fish, well below the average run size of 40,460 fish. The forecast generated by the Taku River Chinook salmon model produced a terminal run size estimate of 37,900 fish. However, due to consistent overestimation in recent years, this preseason forecast was reduced by the percentage error of $42 \%$ reflecting the 5 -year average forecast performance. An additional consideration for reducing the model produced forecast was the general poor performance of Chinook salmon stocks in recent years from Central British Columbia to the Yukon River.

At a run size of this magnitude, factoring in the revised interim MSY escapement point target of 25,500 fish, there was no AC for either the U.S. or Canada based on the preseason forecast.

Table 6. Weekly large Chinook salmon guideline harvest for the Canadian commercial/assessment fishery in the Taku River for 2014.

| Week | Start Date | Assessment/Test harvest | Directed harvest | Guideline |
| :---: | :---: | :---: | :---: | :---: |
| 19 | 4-May | 339 |  | 400 |
| 20 | 11-May | 273 |  | 461 |
| 21 | 18-May | 442 |  | 388 |
| 22 | 25-May |  | 201 | 228 |
| 23 | 1-Jun | 176 |  | 143 |
| 24 | 8-Jun |  |  |  |
| Total |  | 1,230 | 201 |  |

The inseason management of Taku River Chinook salmon depends on abundance estimates generated from the joint MR program in the lower Taku River with tags being applied at Canyon Island and/or other downstream locations and recoveries typically being made in the Canadian test and/or commercial fisheries. In recent years, when the preseason forecast or inseason projections have indicated no AC, the commercial fishery has operated in an assessment mode and served as the test fishery identified in the PST agreement. In 2014, the assessment fishery was conducted but using a target of 1,200 reduced from 1,400 as discussed in the February TBR Panel meeting.

The 2014 management plan indicated that the Chinook salmon assessment/test fishery was scheduled to open at noon Sunday, May 4. Extensions and subsequent weekly fishing periods would be made until the assessment targets were achieved. Attempts were to be made to spread the weekly harvest over 3 days, to a maximum of 5 days allowing a minimum of 48 consecutive hours for free passage. Mesh sizes would be restricted to between 100 mm ( 4 inches) and 204 mm ( 8 inches) and net length would be up to 36.6 m ( 120 ft ). Use of set nets was prohibited during the assessment fishery and fishers were restricted to a total of one drift net. If inseason run projections were greater than 31,900 large Chinook salmon, a directed Canadian commercial fishery could be initiated (provided the weekly guideline exceeded the assessment/test fishery target) in accordance with weekly projections of terminal run size and guideline harvests. The Canadian harvest would be managed with the objective of meeting escapement and agreed Canada/U.S. and domestic harvest sharing provisions.

Annex IV, Chapter 1, paragraph 4 of the PST prescribes the response of either party in the event that either party exceeds its harvest allocation in any three of five consecutive years. Over the past five years Canada had overages in three years requiring a management response. As such, the directed fishery would not open until there were two consecutive run assessments identifying an AC. Additionally, weekly guideline harvests would be reduced by $30 \%$. These measures were to address the triggered management response and the uncertainty associated with inseason run projections to help ensure that the AC was not exceeded.

The Chinook salmon assessment fishery opened on May 4 (SW 19) for an initial 20 hour period. The fishery was extended for an additional three periods (12, 20, and 24 hours). The fishery ended for the week on day four despite not achieving the weekly target of 400. This allowed for 72 consecutive hours of free passage. There were three licenses present and the harvest of large Chinook salmon was 339 for the week. The CPUE averaged 36 fish per boat day (fbd) which was above average ( 27 fbd ) for SW 19. Water levels were above average and steadily increased through the week.

The initial opening for SW 20 was set for 20 hours beginning on May 11 and an additional three periods were added (20, 20, and 24 hours). The weekly guideline harvest was 461 large Chinook salmon. Two licenses fished and caught a total of 273 fish. The weekly average CPUE was 39 fbd which was near average (37) despite very high water levels in SW 20. After day four, Canada produced a terminal run projection of 33,456 large Chinook salmon which identified a Canadian AC of 1,556 . As prescribed in the draft management plan, Canada would not prosecute a directed Chinook salmon fishery until there were two consecutive run assessments identifying an AC.

The assessment fishery opened for 24 hours on May 18 to start SW 21. Two additional fishing periods of 20 hours were added. The weekly guideline harvest was set at 388 pieces and up to four licenses fished catching a total of 442 large Chinook salmon. The weekly average CPUE was 41 fish per boat day, above the average of 29. The water dropped during SW 21 returning to near average levels. After the fishery closed for the week, Canada produced a second consecutive terminal run size estimate which identified a Canadian AC (terminal run size $=34,494, \mathrm{AC}=2,594$ ).

For SW 22, Chinook salmon management switched to a directed fishery based on the previous two terminal run estimates. The weekly guideline harvest was set at 228 (using an AC of 2,594 reduced by $30 \%$ ). The fishery opened for six hours starting at noon on May 25. Six licenses fished for 6 hours each and caught a total of 201 large Chinook salmon. No further fishing time was added for the week. Harvest rates were extremely good (134 fbd), well above the weekly average of 25 . Water levels were stable and below average for this time of the year. After May 25, a terminal run projection of 31,802 large Chinook salmon was made which was well below the previous two estimates. The fishery returned to assessment mode for a final period in SW 23 with a weekly target of 143 large Chinook salmon. The fishery opened for 4 hours on June 01 and two fishing periods were subsequently added ( 4 and 2 hours). Harvest rates were well above the weekly average and up to 6 licenses fished catching 176 large Chinook salmon. The terminal run projection after the weekly fishing period was 19,583 large Chinook salmon.

There was no fishery for SW 24.
The directed/assessment fishery catches noted in Table 7 total 1,431 large Chinook salmon; the combined weekly guideline harvest plus the assessment/test fishery target sum to 1,428. The Chinook salmon bycatch harvest in the sockeye salmon fishery was 840 fish; adding the AF harvest of 96 and an assumed recreational harvest of 105 , the actual BLC was 1,041
large Chinook salmon, 33\% below Canada's BLC. Efforts to minimize commercial bycatch included the mesh restriction and reduced openings.

Table 7. Forecasts of terminal run size, allowable catch, and weekly guideline, and actual harvest of Taku River large Chinook salmon, 2014.

|  |  | Allowable <br> harvest <br> Reduced by |  |  |  |

( ): No directed Chinook salmon fishery.
As per normal procedures, weekly fisheries for sockeye and coho salmon opened at noon Sunday. Fishing periods were set with a view to achieving weekly guideline harvests. Extensions to weekly fishing periods were considered if the weekly guidelines were not achieved. For both drift and set gillnets, net length was restricted to a maximum of 36.6 m ( 120 ft .); mesh sizes were restricted to between 100 mm ( 4 inches) and 204 mm ( 8 inches) except for the period from June 15 (SW 25) through July 05 (SW 27) when the maximum permissible was 14.0 cm ( 5.5 inches) in order to reduce the bycatch of Chinook salmon.

The preseason forecast generated by Canada for wild Taku River sockeye salmon was based on stock recruitment and sibling analyses, and projected a run of 190,083 fish, above the average run size of 183,000 fish. Approximately 3,088 enhanced fish from Tatsamenie Lake were forecasted, below the average Tatsamenie enhanced run size of 5,800 fish. Based on the treaty arrangement, an enhanced run of 1 to 5,000 fish provides Canada with a $20 \%$ share of the TAC, with management based on weekly estimates of the TAC of wild fish. Subtracting the escapement target of 75,000 wild sockeye salmon from the forecast of 190,083 resulted in an overall TAC of 115,083 fish; $20 \%$ of that was 23,017 fish.

The forecast for the run of wild Tatsamenie fish was 2,784 fish, below the average of approximately 10,200 fish. The egg-take goal for the 2014 season was based on a target of $30 \%$ of the escapement up to a maximum of 2.0 million eggs. During SWs 31-33 (July 27August 16), management attention focused on Tatsamenie sockeye salmon to ensure an adequate number of sockeye salmon escaped to Tatsamenie Lake to support wild production and egg-take objectives.

As in past years, guideline harvests were developed each week for both sockeye and coho salmon fisheries to guide management decisions so that: a) the harvest was consistent with conservation and Treaty goals; and b) management was responsive to changes in projections of abundance, i.e. abundance-based.

The following summarizes the fishery management on a weekly basis. Sockeye salmon catches in relation to run projections are for wild fish; CPUE data is for wild and enhanced fish combined. Guideline harvests presented in Table 8 are based on run projections made the previous week; additionally, those identified in the verbiage were generally based on the previous week's run projection. Guidelines identified in Table. 8 were set using a 20:80 harvest split for the entire season.

The management plan indicated that the sockeye salmon fishery would open for two days in SW 25 (June 15-21) unless otherwise modified based on Chinook salmon concerns. The weekly guideline based on the preseason forecast was 1,197 wild fish (Table 8). Day one effort was nine licenses, near average, and the CPUE of 69 fbd was well above the weekly average of 26. CPUE for Chinook salmon ( 16 fbd ) was half of the 2005-2013 weekly average (31). Water levels were below average and stable. The fishery was held at two days, resulting in a weekly harvest of 1,209 sockeye and 280 large Chinook salmon.

Week 26 (June 22-28) was opened for two days. The weekly guideline harvest for this week, based on the preseason forecast, was 1,480 sockeye salmon. Ten licenses fished Day 1 ; the CPUE of 57 fbd was slightly above the weekly average of 52 . CPUE for Chinook salmon was 15 fbd slightly above the weekly average of 12 fbd . The fishery was extended to three days. Water levels remained below average and relatively stable for the week. Weekly harvest totals were 1,464 sockeye and 285 large Chinook salmon.

Table 8. Canadian inseason forecasts of total run size, total allowable catch, and spawning escapement of wild Taku River sockeye salmon, 2014.

| Week | Terminal Run | Total Allowable Catch | Projected Escapement | Canadian Total Allowable Catch | Inseason Guideline | Actual <br> Catch |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 25 | 190,083 | 115,083 | 75,000 | 23,017 | 1,197 | 1,209 |
| 26 | 190,083 | 115,083 | 75,000 | 23,017 | 2,677 | 2,672 |
| 27 | 157,542 | 82,542 | 119,211 | 16,508 | 3,801 | 3,743 |
| 28 | 169,785 | 94,785 | 124,291 | 18,957 | 5,367 | 6,042 |
| 29 | 196,956 | 121,956 | 136,422 | 24,391 | 8,266 | 7,877 |
| 30 | 168,241 | 93,241 | 101,009 | 18,648 | 10,683 | 10,973 |
| 31 | 160,926 | 85,926 | 93,784 | 17,185 | 13,465 | 13,328 |
| 32 | 181,204 | 106,204 | 115,692 | 21,241 | 16,448 | 15,937 |
| 33 | 154,310 | 79,310 | 97,670 | 15,862 | 17,609 | 16,095 |

Note: Pre-week run assessments and weekly guidelines based on previous week's run size.
Week 27 (June 29-July 05) was opened for two days. The weekly guideline harvest for this week, using inseason information, was 1,124 sockeye salmon. The terminal run projection after SW 26, 157,542 fish, was below the preseason forecast. The CPUE for Day 1 was 53 fbd near the weekly average of 52 fbd . Based on the catches for Day 1 (525) and the reduced run projection, it was felt no further fishing time was warranted. The river level remained below average and stable for the two days of fishing. The weekly harvest was

1,071 sockeye, 98 large Chinook, and 2 coho salmon with an average of ten licenses fishing. The weekly projection after this week's fishery was 169,785 fish, above the SW 26 projection.

Week 28 (July 06-12) was again opened for two days. The weekly guideline was set at 1,566 sockeye salmon. The allowable maximum mesh size was increased from 14.0 mm ( 5.5 inches) to 204 mm ( 8 inches) in order to reduce bycatch of pink salmon which were now present in the fishery. Day 1 and 2 CPUE ( 53 and 79 fbd ) were near and above the weekly average of 54 fbd . Run assessments made after Day 1 and 2 suggested that the run was above the preseason forecast of 190,000. Additionally, Canyon Island sockeye salmon catches were well above average. Based on the improved run outlook, two additional fishing periods of one day each were added for a total of four days for the week. The weekly harvest was 2,299 sockeye salmon, bringing the cumulative to 6,042 fish, above the guideline of 5,367 fish. A total of 113 large Chinook and 13 coho salmon were also caught. The weekly effort averaged 10 licenses, and the water remained stable and near average during the fishing period. The final weekly sockeye salmon CPUE was 58 fbd , above the average of 54 fbd . The run projection made after Day 3 (196,956 fish) was well above the SW 27 projection.

Based on the previous week's projection, the weekly guideline for SW 29 (July 13-19) was 2,900 sockeye salmon. An opening of three days was posted. The first three days of the fishery were characterized by extremely high water and very poor fishing conditions. The combined harvest rate for the first three days of the fishery was 22 fbd versus an average of 78 fbd for this period. After Day 2, the fishery was extended for two days and then one more day after Day 3 in hopes fishing conditions would improve. As water levels dropped, catches started to pick up on Day 5 and harvest rates were near average by Day 6. The weekly harvest was 1,834 sockeye, 29 large Chinook and 124 coho salmon. Twenty enhanced Tatsamenie fish were also caught. The weekly effort ranged from four to 11 licenses. The run projection of 168,241 fish, made after Day 3, was well below the SW 28 projection and very similar to the projection from SW 27.

Week 30 (July 20-26) was opened for three days. The weekly guideline was set at 2,416 sockeye salmon. River levels were back to below average and steadily declined through the week. CPUE was below average for Day 1 but for Day 2 and 3, the CPUE ( 105 fbd ) had improved to near average ( 113 fbd ). No additional fishing time was added for the week. The weekly harvest was 3,096 sockeye, 27 large Chinook and 346 coho salmon. The cumulative sockeye salmon harvest after SW 30 was 10,973 fish, near the guideline of 10,683 fish. Sixty-seven enhanced Tatsamenie fish were also caught. The weekly effort averaged 12 licenses. After Day 3, a run projection of 160,926 fish was made which was slightly below the previous week's estimate.

Week 31 (July 27-August 02) was opened for two days with a view that Tatsamenie fish should be near peak timing. The weekly guideline was set at 2,782 sockeye salmon based on the estimate from SW 30. A run projection made after Day 1 suggested the run size had improved and an additional day of fishing was added. The harvest rate for the three days was 93 fbd which was below the average of 120 fdb for this period. The weekly harvest
was 2,355 wild sockeye salmon and 77 enhanced Tatsamenie fish. Weekly effort averaged nine licenses and the river level was below average and stable. The run projection increased to 181,204 fish with an escapement estimate of 115,692 wild sockeye salmon.

The guideline harvest for SW 32 (August 03-09) based on the previous week's run projection was set at 2,982 sockeye salmon. Due to the poor showing of enhanced Tatsamenie fish (and what was assumed the same for the wild Tatsamenie fish) in SW 31, it was decided to open the fishery for a two day period. After Day 1, the current run projection and Canyon Island catches remained favourable so an additional day was added. The weekly CPUE was 85 fbd (versus an average of 117 fbd ) for 11 licenses; fishing conditions were favourable as water levels were below average and stable. The run projection of 154,310 sockeye salmon had dropped significantly by Day 3 and the escapement projection was estimated to be approximately 98 k wild sockeye salmon. The weekly harvest was 2,608 wild and 191 enhanced sockeye salmon.

Week 33 (August 10-16) started with a weekly guideline of 1,162 fish. With the drop in the run projection and the poor Tatsamenie catches the previous week, the fishery was opened for two days only. River levels were well above average for the beginning of the week and persisted until the end of the fishing period. The fishery was extended for two days due to poor fishing conditions at the outset but harvest rates remained low ( 6 fbd versus average 84 fbd$)$. Weekly effort averaged eight licenses. A total of 178 fish were caught, of which 158 were wild and 20 were enhanced.

This marked the end of the directed sockeye salmon fishery. The run projection after SW 33 was 137,427 wild fish, well below the preseason forecast; the cumulative guideline harvest was 17,609 fish at a $20 \%$ harvest share. The actual harvest of wild fish was 16,095 . The escapement projection was 83,266 wild fish, just above the goal range of 71,000 to 80,000.

Adding the wild sockeye salmon taken in the directed coho salmon fishery $(1,011)$ brought the total commercial harvest to 17,106 wild fish. The season harvest of Taku River enhanced fish was 462 which were all from Tatsamenie Lake. In addition, 66 Stikine River and 11 U.S. origin fish were caught.

Postseason numbers for the above are presented in the Sockeye Salmon Run Reconstruction section.

The forecast for the total run of Taku River coho salmon in 2014 was 168,173 fish. This forecast was generated using the relationship between the CPUE in smolt tagging and the total run estimates seen over the past seventeen years. The average total run of Taku River coho salmon is 187,000 fish. Assuming average U.S. exploitation rates, this translated to a border escapement of approximately 97,854 fish. Based on preliminary escapement goal analysis, the U.S. intent was to manage its fisheries to target a minimum above border run of approximately 75,000 coho salmon. Canada would endeavor to harvest 3,000 fish in the commercial fishery starting in SW 34 for assessment purposes, plus any surplus
escapement above 70,000 fish. Approximately 2,000 coho salmon would be set aside for a test fishery to be conducted as commercial effort dissipated.

Week 34 (August 17-23) was opened for three days based on the above forecast. The weekly guideline harvest was set at 2,866 coho salmon (projected to be about 20,000 surplus to escapement). An additional day was added due to high water levels and poor fishing conditions for Day 1 and 2. The fishery was held at four days to limit incidental sockeye salmon harvest. Harvest rates were close to average ( 58 fbd versus 60 fbd ). Effort was above average ( 9.5 licenses versus 5.4 ) and a total of 2,214 coho salmon were landed. The MR estimate as of day 3 indicated that 34,270 coho salmon had crossed the border; this projected to 127,288 fish, well above the preseason forecast. Accordingly, escapement to date was 29,360 fish, with a projection of 88,695 fish.

Week 35 (August 24-30) opened for four days with a guideline harvest of approximately 7,400 . Harvest rates for the first two days of the fishery were twice the average, and Canyon Island catches were also well above average. The fishery was extended for two days for a total of six. A bilateral run projection made after Day 3 (154,361 fish) was well above the SW 34 projection. The escapement to date was approximately 46,130 fish projecting to 103,355 fish. Water levels were average to below average, and the effort was consistently nine licenses for the week. The CPUE of 98 fbd was above the average of 73 fbd . A total of 5,105 coho salmon were caught, which surpassed the record set in 2013 (3,223 fish).

Another four day opening was posted for SW 36 (August 31-September 06) with a weekly guideline harvest of 13,400 . The bilateral run projection made after Day 3 was 147,079 fish, with escapement at 57,434 fish, projecting to 99,691 fish. The fishery was extended to seven days based on the continued strong run outlook. River levels were generally below average. Effort averaged seven licenses. A total of 2,853 coho salmon were caught, which was well above average for this period. The CPUE of 77 fbd was near average ( 79 fbd ).

Week 37 (September 07-13) was opened for seven days based on the previous week’s outlook and an estimated AC of approximately 77,000. It was anticipated that effort would start to decline significantly for this period as fishers prepared to leave. An average of three licenses fished for six days. The CPUE of 75 fbd , well above the average of 36 fbd , resulted in a harvest of 1,431 coho salmon. The run projection made after Day 3 was 143,924 coho salmon, consistent with the SW 36 estimate.

Week 38 (September 14-20) was also opened for seven days. One license fished for two days catching 165 coho salmon. The fishery was subsequently opened until the end of SW 41 (October 11) as effort was anticipated to be low and the escapement objectives had been met. No catches were reported for the final three weeks.

## Escapement

## Sockeye Salmon

Spawning escapement of sockeye salmon into the Canadian portion of the Taku River drainage is estimated from the joint Canada/U.S. MR program. Counting weirs operated
by DFO at Little Trapper and Tatsamenie lakes and by the TRTFN at Kuthai and King Salmon lakes provide some information on the distribution and abundance of discrete spawning stocks within the watershed.

The sockeye salmon MR program has been operated annually since 1984 to estimate the above border run size, spawning escapement is then estimated by subtracting the inriver harvest. The preliminary postseason estimate of above border run in 2014 is 110,258; subtracting the inriver harvest of 17,795 fish ( 17,568 commercial, 219 Aboriginal, and 8 assessment/test) indicates that 92,463 sockeye salmon reached the spawning grounds. An estimated 931 of these were thermally marked fish. The wild spawning escapement was below average, but above the interim escapement goal range of 71,000 to 80,000 sockeye salmon. The Canyon Island fish wheel catch of 5,342 sockeye salmon was above average.

The sockeye salmon count through the Kuthai Lake weir was 155 fish; however it is presumed that some additional sockeye salmon arrived after the weir was pulled since 208 fish were enumerated during an aerial survey conducted on September 16. This is the third time since 2007 that counts have been close to this value. The 2014 count was only $13 \%$ of the average of 1,560 fish and $14 \%$ of the primary brood year escapement of 1,442 fish.

A weir was again operated at King Salmon Lake in 2014. The count of 1,061 fish was $32 \%$ below average but roughly equal to the primary brood year escapement estimate based on an aerial survey expansion. Counts were sporadic and approximately $50 \%$ of the fish were enumerated on the last two days of fish passage. On July 21, the weir was breached due to bear activity and an estimated 50-100 fish passed through uncounted. There were 151 removals for artificial spawning.

The Little Trapper Lake weir count was 6,607 sockeye salmon. This was $27 \%$ below the average of 9,020 fish but above the primary brood year count of 5,552 fish. Although somewhat late to start, overall the run timing was about average, with the midpoint occurring on August 9. There were no removals for artificial spawning.

The Tatsamenie Lake weir count of 2,106 sockeye salmon was $76 \%$ below the average of 8,724 fish and almost identical to the primary brood year count of 2,032 fish. The run was about a week late with the midpoint occurring on September 5. Based on preliminary data, $44 \%$ of the escapement was enhanced. Approximately 758 fish were removed for broodstock.

## Chinook Salmon

Spawning escapement of Chinook salmon in the Canadian portion of the Taku River drainage was estimated from the joint Canada/U.S. MR program. Tag application took place from April 25 through July 14. A new drift gillnetting initiative undertaken close to Yehring Creek downstream of Canyon Island accounted for 75\% of the tags applied. Tag recovery effort consisted of assessment/test or commercial fisheries from May 4 through June 3 (SWs 19-23), as well as the sockeye and coho salmon commercial fisheries (SWs 25-38); in addition, there was spawning ground sampling in August and September on the

Nakina, Tatsatua, Kowatua, Nahlin, Dudidontu rivers, as well as Tseta Creek. Fishery and spawning ground data was combined to give an inriver run estimate of 26,004 large Chinook salmon. Subtracting the inriver harvest of 2,472 fish resulted in a spawning escapement estimate of 23,532 fish; within the escapement goal range of 19,000 to 36,000 large Chinook salmon.

Aerial surveys of large Chinook salmon to the five escapement index areas were as follows: Nakina 1,040 fish (57\% of average); Kowatua 384 fish ( $60 \%$ of average); Tatsamenie 376 fish (45\% of average); Dudidontu 193 fish (53\% of average); Nahlin 304 fish ( $35 \%$ of average); and Tseta Creek was not flown. Viewing conditions were excellent for all surveys. The total count of 2,297 large Chinook salmon was $53 \%$ of average.

Carcass weirs were again operated on the Nakina and Tatsatua rivers in order to obtain tag and age-length-sex data. A total of 133 large Chinook salmon were recovered on the Nakina River, well below the average ( 578 fish). On the Tatsatua River, 173 large Chinook salmon were encountered, either on the weir or through supplemental angling. This was also below average ( 438 fish). Comparisons between years should be made cautiously as water levels, effort and fish distribution can have a significant effect on the numbers of fish observed.

## Coho Salmon

Spawning escapement of coho salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. MR program. Tag application occurred from June 29 until October 3 (SW 40) and recovery occurred until September 9 (SW 41). The tag recovery effort consisted of the commercial fishery followed by a four week test fishery which commenced September 14 (SW 38) and caught 500 fish per week. The final postseason MR estimate is 140,739 fish. Taking into account the inriver harvest of 16,568 fish ( 14,464 commercial, 104 Aboriginal, and 2,000 test) the spawning escapement estimate is 124,171 fish. This is $25 \%$ above average and well above the 2014 escapement objective of 70,000 fish.

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels were used as an index of escapement. A total of 2,436 pink salmon were captured in the fish wheels in 2014; this was below average.

## Chum Salmon

Chum salmon escapement numbers to the Taku River are unknown; however, the numbers of fall chum salmon captured by the fish wheels at Canyon Island were used as an index of escapement. A total of 310 chum salmon were captured in the wheels in 2014, which was above average.

## Sockeye Salmon Run Reconstruction

An estimated 30,675 wild and 859 enhanced Taku River sockeye salmon were harvested in the traditional U.S. District 111 drift gillnet fishery. This estimate is based on postseason GSI analysis. An additional 1,098 wild and 35 enhanced sockeye salmon were estimated to have been taken in the U.S. inriver personal use fishery. The estimated total U.S. harvest of Taku River sockeye salmon is 32,309 wild and 919 enhanced fish (Table 5).

In the Canadian commercial fishery, the postseason harvest estimate of Taku River sockeye salmon is 17,568 fish; 17,106 wild and 462 enhanced Tatsamenie Lake fish. There were also 77 non-Taku River enhanced fish harvested; 66 from the Stikine River and 11 from U.S. domestic stocks to bring the total Canadian commercial harvest to 17,645 fish. An estimated 212 wild and 7 enhanced sockeye salmon were taken in the Canadian AF. Therefore, the estimated Canadian treaty harvest of Taku River sockeye salmon is 17,318 wild and 468 Taku River enhanced fish (Table 5). The test/assessment fisheries harvested 8 fish.

The postseason estimate of the above border run size of sockeye salmon, based on the joint Canada/U.S. MR program is 110,258 fish. Deducting the Canadian inriver harvest noted above from the above border run estimate results in an estimated escapement of 92,463 sockeye salmon; 91,570 wild. The escapement of Taku River sockeye salmon originating from the fry stocking program was estimated to be 893 fish from broodstock otoliths collected at Tatsamenie Lake. The terminal run of Taku River sockeye salmon is estimated at 143,$487 ; 141,206$ wild and 2,281 enhanced fish. Based on the escapement goal of 75,000 fish, the wild AC was 66,206 fish and combining wild and enhanced terminal run the TAC was 68,487 sockeye salmon. The harvest sharing agreement based on total terminal enhanced run was $80 \%$ U.S. and $20 \%$ Canada.

#### Abstract

ALSEK RIVER Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 3). Unknown quantities of Alsek River origin fish may also be taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although Aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 3).

## Harvest Regulations \& Management Objectives

Although harvest sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV, Chapter 1 calls for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook and sockeye salmon. The bilaterally agreed to biological escapement goal for Alsek Chinook salmon is 3,500 to 5,300 fish (Klukshu River: 800 to 1,200 fish). The bilaterally agreed to biological escapement goal for Alsek River sockeye salmon is specific to the Klukshu River and is 7,500 to 11,000 fish. The principle escapement monitoring tool for Chinook and sockeye salmon stocks on the Alsek River is the Klukshu River weir, operated by the DFO in cooperation with the CAFN. The weir has been in operation since 1976.

Traditional MR programs to estimate the total inriver abundance and the fraction of the escapement contributed by the Klukshu stocks were implemented for a number of years one and two decades ago and continue in the form of genetic based estimates funded through the Northern Endowment Fund in more recent years.

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas.

## Preseason Forecasts

The 2014 overall Alsek River sockeye salmon run was expected to be slightly below average at approximately 60,000 sockeye salmon. The outlook for 2014 was based on a predicted run of 14,600 Klukshu River sockeye salmon derived from the latest Klukshu River stock-recruitment data (Eggers et al. 2011) and a Klukshu River contribution rate to the total run of 23\% (based on MR results, 2000-2004, and run size estimates using GSI
(2005, 2006, 2011-2013). Principal contributing brood years were 2009 (Klukshu River escapement of 5,500 sockeye salmon) and 2010 (Klukshu River escapement of 18,550 sockeye salmon); the average of Klukshu River sockeye salmon escapement is approximately 10,700 fish.

The Klukshu River early sockeye salmon run count in 2009 was 1,247 fish and in 2010 was 5,073 fish. The average early weir count was approximately 2,500 sockeye salmon which is above the assumed optimum escapement level of 1,500 fish as determined through Canadian stock-recruitment analyses of the early run. The early run to the weir was expected to be above the optimum escapement level in 2014.

The Klukshu River Chinook salmon escapement in 2008 was 466 fish and in 2009 was 1,518 fish. For comparison, the average is approximately 1,200 Chinook salmon. Based on these primary brood year escapements, the outlook for 2014 was 1,900 Klukshu River Chinook salmon, which is above average and above the upper end of the escapement goal range.

The coho salmon escapements at the Klukshu River weir in 2010 (2,361 fish) and 2011 ( 2,110 fish) suggested the run in 2014 would be above average. The average weir count is approximately 1,900 coho salmon.

## U.S. Fisheries

Preseason expectations were for below average runs for sockeye salmon and above average runs for Chinook salmon. These expectations were based on parent-year escapements to the Klukshu River. In 2013, the Alsek River recorded a below average run for sockeye salmon, however the escapement goal was attained. Chinook salmon runs were above average in 2013, and the escapement goal as measured at the Klukshu River was achieved.

In 2014 management decisions were made by monitoring fishery performance data and comparing it to historical CPUE for a given opening to adjust time and area openings. The Alsek River commercial fishery opened on June 1 for two days. Both the Chinook and sockeye salmon harvests were well above average. Fourteen permits harvested 363 Chinook and 2,517 sockeye salmon during the first opening (Table 1). Peak sockeye salmon harvest occurred during SWs 25 (13 permits) and 30 (10 permits) with equal harvest numbers. Effort started to decline by SW 32 and by SW 33 coho salmon management strategies were in place. Coho salmon are targeted starting in mid-August and effort becomes minimal. Fishing times remained at three days per week from SW 33 through the second week in October (SW 41), and the river was not fished during the last eight weeks of the season.

The 2014 Dry Bay commercial set gillnet fishery harvested 1,074 Chinook, 33,668 sockeye, and 3 coho salmon (Table 9). No pink and 12 chum salmon were harvested.
A test fishery for Chinook salmon was conducted in the Alaska portion of the Alsek River in 2005-2008 and from 2011-2012. The test fishery for Chinook salmon was not conducted in 2014.

## Canadian Fisheries

Due to the absence of the harvest monitor position in 2014, catches from the food fishery were estimated based on fishery performance data compared with the weir counts. The harvest estimate for 2014 was comprised of the fish taken from the Klukshu River weir (elders only) and an estimate of harvest above/below the weir (based on the past relationship with the weir count and harvest). An estimated 17 Chinook, 1,140 sockeye and no coho salmon were harvested in the food fishery. The average harvests are 69 Chinook, 1,182 sockeye, and 6 coho salmon.

Harvest estimates for the Tatshenshini River recreational fishery were an estimated 26 Chinook salmon retained (166 fish released), and zero sockeye salmon retained (8 fish released). There were no recorded coho salmon retained (1 fish released) although this is considered incomplete as fishing may have taken place after monitoring had ceased. These catches were $56 \%, 0 \%$, and $0 \%$ of average for Chinook, sockeye and coho salmon, respectively. Due to the low Chinook salmon forecast, nonretention of Chinook salmon was implemented on July 26 in the Yukon Territory portion of the Tatshenshini River. Liberalization of the sockeye salmon harvest limits occurred on September 6 as the escapement objective had been met.

Management of salmon in the Yukon Territory is a shared responsibility between DFO and the Salmon Sub-Committee (SSC). The SSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the SSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

Table 9. Harvest and Klukshu River index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2014.

|  | Chinook | Sockeye | Coho |
| :--- | :---: | :---: | :---: |
| Escapement Index $^{\text {a }}$ |  |  |  |
| Klukshu Weir Count | 842 | 12,384 | 341 |
| Klukshu Escapement | 833 | 12,148 | 341 |
|  |  |  |  |
| Harvest $^{\text {b }}$ |  |  |  |
| U.S. Commercial | 1,074 | 33,668 | 3 |
| U.S. Subsistence | 12 | 60 | 0 |
| U.S. Test | 0 | 0 | 0 |
| Canadian Aboriginal | 17 | 1,140 | 0 |
| Canadian Recreational | 26 | 0 | 0 |
| Total | 1,129 | 34,868 | 3 |

${ }^{\text {a }}$ Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
${ }^{\mathrm{b}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for harvest other than the listed fisheries.

The 2014 Alsek-Tatshenshini Management Plan was adopted by CAFN, SSC, and DFO. For Chinook salmon and early run sockeye salmon management, the status of the Klukshu River weir counts was to be reviewed on or about July 18 to ensure weir and spawning escapement targets were on track. The status of the late run sockeye salmon would be reviewed the first week of September. Adjustments to inseason fishing regimes in the recreational and Aboriginal fisheries would be made if deemed necessary. Other key elements of the plan are described in the paragraphs below.

The center of Aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines Highway, about 60 km south of Haines Junction. Salmon are harvested by means of gaff, small gillnets, sport rods, and traditional fish traps as the fish migrate up the Klukshu River and into Klukshu Lake. The fishing plan for the AF in the Klukshu River and adjacent areas allowed for fishing by any means (as established in the communal license) 7 days a week. Conservation thresholds that might invoke restrictions in the AF were projected Klukshu weir counts of $<1,100$ Chinook salmon and $<1,500$ early sockeye salmon. Food fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The plan did not restrict the fishery other than to reserve harvests of Chinook salmon at Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the recreational fishing effort on the Alsek drainage occurs in the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 unless the weir count projection for the early run was greater than 4,500 sockeye salmon. The Chinook salmon daily harvest limit was one per day, two in possession. For other salmon species,
the daily harvest and possession limits were two and four fish, respectively. However, the aggregate limit for all salmon combined was two salmon per day, four fish in possession. Starting in 2003, recreational salmon fishing was permitted in the Tatshenshini River seven days a week; this fishery had previously been open from 6:00 am Saturday to 12:00 noon Tuesday each week. Headwater areas in the vicinity of the British Columbia/Yukon border were to be closed in late July to protect spawning Chinook salmon. Conservation thresholds that were expected to invoke additional restrictions in the recreational fishery were projected Klukshu weir counts of $<1,000$ Chinook salmon and less than 10,500 sockeye salmon (early and late runs combined).

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the SSC in 1999, was required by all recreational salmon fishers in 2014. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon recreational fishery. Anglers are required to report their harvest via mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River Bridge crossing up to the new weir location to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini confluence.

## Escapement

Total drainage abundance programs are being investigated as part of the development of abundance-based management regimes and to accurately assess whether the escapement goals for Alsek River Chinook and sockeye salmon stocks are appropriate and if so, are being achieved. At this time, there are no programs in place to estimate the drainage wide coho salmon escapement. A large and variable proportion of the escapement of each species is enumerated at the weir on the Klukshu River. Current escapement monitoring programs including the Klukshu weir, Village Creek electronic counter, GSI based run reconstructions, and aerial surveys allow annual comparisons of escapement indices. The most reliable long term comparative escapement index for Alsek River drainage salmon stocks is the Klukshu River weir count. Escapements for 2014 are shown in Table 9.

## Sockeye Salmon

In 2014, the Klukshu River sockeye salmon weir count was 12,384 and the escapement estimate was 12,148 (Table 9). The count of 2,732 early run fish (count through August 15) was slightly above the average of 2,571 as was the count of 9,652 late run fish with an average of 8,584 . The total escapement of 12,148 fish was above the upper end of the recommended escapement goal range of 7,500 to 11,000 fish. The partial sockeye salmon count at Village Creek was 189; average is 2,400 fish. In 2014, a video system was used to enumerate fish at Village Creek but only provided counts from approximately mid-August to early September.

## Chinook Salmon

The most reliable comparative Chinook salmon escapement index for the Alsek River drainage is the Klukshu River weir count. In 2014, the Chinook salmon weir count was 841 fish and the escapement estimate was 832 fish (Table 9,). The 2014 escapement estimate was just above the lower end the escapement goal range of 800 to 1,200 Klukshu Chinook salmon.

## Coho Salmon

The Klukshu River coho salmon weir count was 341 well below the average of 1,950 fish.

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2014, sockeye salmon eggs were collected at Tahltan Lake on the Stikine River for the twenty-sixth year and in the Tatsamenie Lake system on the Taku River for the twentyfifth year of this program.

## Tahltan Lake

In 2014, Triton Environmental Consultants Ltd. were contracted to perform the egg take. The egg-take goal had been set at 6.0 million in the approved Stikine River Enhancement Plan. Prior to the start of the season Canada advised Alaska that they were revising the goal to 5.0 million because of a decision they had made to not stock sockeye salmon fry into Tuya Lake based on domestic issues; Canadian technical staff determined that the fry from a 5.0 million level egg take could all be planted into Tahltan Lake without exceeding agreed to treaty stocking guidelines. Egg-take activities were completed with approximately 3.9 million sockeye salmon eggs being delivered to Snettisham Hatchery. This fell short of the egg-take goal. It is not known what conditions may have hampered broodstock collection. Three of the twelve lots of eggs being transported to the hatchery were delayed by one day due to weather, one was delayed by two days and two of the twelve lots were delayed by three days. This level of delay is not inconsistent with past experience at the lake, although it was the greatest number of eggs delayed for 3 days. While almost all lots of eggs looked good upon arrival at Snettisham Hatchery, subsequent egg survival to 100 CTU was $75.9 \%$, which is lower than desired.

## Tatsamenie Lake

In 2014, B. Mercer and Associates Ltd was contracted to collect eggs at Tatsamenie Lake. Broodstock was captured for the twentieth year near the assessment weir at the outlet of Tatsamenie Lake and held until ripe. Escapement through the weir was 2,106 fish, with $\sim 1,200$ (57\%) being females. An estimated 1.5 million sockeye salmon eggs were delivered from Tatsamenie Lake to Snettisham Hatchery for incubation and thermal marking. While this fell short of the bilaterally agreed-to egg-take goal of 2.0 million in the approved Taku Enhancement Production Plan; it was the maximum eggs that could be collected without
exceeding the recognized Canadian regulation restricting broodstock to no more than 30\% of escapement. Two of the four lots of eggs being transported to the hatchery were delayed by a day due to weather. These delays are largely due to short day length in the late fall. Average egg survival to 100 CTU was $89 \%$.

## King Salmon Lake

On September 14, 2014 an estimated 200,000 sockeye salmon eggs were collected from 71 females at King Salmon Lake. The estimated survival of these eggs is $89 \%$ to the 100 cell stage. This project is supported by the Northern Endowment Fund and led by the Taku River Tlingit Fisheries group. A similar number of eggs were collected in 2012.

## Incubation, Thermal Marking, and Fry Plants

Snettisham Hatchery is operated by DIPAC, a private aquaculture organization in Juneau. A cooperative agreement between ADF\&G and DIPAC provides for Snettisham Hatchery to serve the needs of the joint TBR enhancement projects.

Egg incubation and thermal-marking at Snettisham Hatchery went smoothly in 2013/2014. In 2014, brood year 2013 fry were transported to the appropriate systems from May 27 to June 12. There were modest IHNV losses of the 2013 brood year. An estimated 370,000 eggs from two Tahltan Lake incubators and an estimated 184,000 Tatsamenie fry in a single incubator were confirmed positive with IHNV and destroyed.

## Tahltan Lake

In 2014, a total of 2.066 million sockeye salmon fry were stocked back into Tahltan Lake. These fish were from eggs collected in Tahltan Lake in the fall of 2013. Survival from green-egg to stocking fry was 59\%. Fry stocking took place on May 27, 28 and 29.

## Tuya Lake

In 2014, a total of 462,000 sockeye salmon fry were stocked in Tuya Lake. These fish were from eggs collected at Tahltan Lake in the fall of 2013. Survival from green-egg to stocked fry was $66 \%$. Fry stocking took place on June 12.

## Tatsamenie Lake

In 2014, a total of 1.136 million sockeye salmon fry were stocked in Tatsamenie Lake. These fish were from eggs collected at Tatsamenie Lake in the fall of 2013. Survival from green-egg to stocked fry was $73 \%$. Fry stocking took place on May 29, May 30, and June 6. In addition, as part of an onshore extended rearing project, 185,000 fry were released on August 6 and August 9 at 4.2 grams. These fry had been reared to 1.1 grams in the hatchery, transported to the lake on June 11, reared in four onshore rearing tanks located near the northeast end of the lake, and then reared for a short time in lake pens. Preliminary evidence indicates the majority of the fed fry went out in August as $0+$ smolts. This was the sixth
year of this program. Full evaluation of the success of this study will not be available until these fish return as adults.

## King Salmon Lake

No fry were available for release at King Salmon Lake in 2014 because eggs were not collected in 2013.

## Sockeye Supplementation Evaluation Surveys

## Acoustic, Trawl, Beach Seine and Limnological Sampling

Standard limnological surveys were conducted at Tatsamenie and Tahltan lakes. No surveys were conducted on Tuya or Trapper lakes. No hydroacoustic surveys were conducted in 2014.

## Thermal Mark Laboratories

## ADF \& G Thermal Mark Laboratory

During the 2014 season, the ADF\&G Thermal Mark Lab processed 18,994 sockeye salmon otoliths collected by ADF\&G and DFO staff as part of the U.S./Canada fry-stocking evaluation program. These collections came from commercial and test fisheries in both U.S. and Canadian waters on the Taku and Stikine rivers over a 10 -week period. The laboratory provided estimates on hatchery contributions for 82 distinct sample collections. Estimates of the percentage of hatchery fish contributed to commercial fishery catches were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.

Preliminary contribution estimates of stocked fish to Alaskan harvest were 9,843 stocked Stikine River fish to District 106 and 108 gillnet fisheries, and 889 stocked Taku River fish to District 111 gillnet fisheries. Preliminary estimates of contributions to Canadian fisheries included 15,474 stocked fish to Stikine River fisheries and 398 stocked fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Subsamples of juvenile and adult otolith samples collected at the study lakes during the 2014 season are being analyzed at the DFO thermal mark lab in Whitehorse.

## APPENDICES

## Standards

Large Chinook salmon are MEF length $\geq 660$
Unless otherwise stated Chinook salmon are large
Test fisheries for Chinook salmon became commercial assessment test fisheries starting in 2004
Data not available to estimate catches of Alaska Hatchery pink and chum salmon
All catches of Tahltan, Trapper, and Tatsamenie lakes, unless otherwise noted, include both wild and hatchery fish.
Bold numbers are incomplete numbers
Italicized numbers used when the GSI estimates do not meet the Credible Intervals: estimating the proportion of mixtures within $10 \%$ of the true mixture $90 \%$ of the time

Appendix A. 1. Weekly harvest of Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2014.

Appendix B. 3. Annual harvest of Stikine River large Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2005-2014.
GSI used for sport and gillnet. Troll is based on GSI 2005-2008 and CWT 2009-present.
For detailed GSI stock comp estimates see Appendix G. 5.

Appendix B. 7. Index counts of Stikine River large Chinook salmon escapements, 19792014.

| Inriver run and escapement generated from mark-recapture studies, inriver and marine harvest as reported in ADF\&G fisheries data series reports Total run from jointly accepted US and Canadian harvest estimates. Terminal run includes only harvest in the Stikine River and District 108. |  |  |  |  |  |  |  |  |  |  |  |  |

Appendix B. 18. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2014
In 1979-1988, there were US estimates and 1983-1988, they overlapped with estimates from Canada and the All tahltan estimate was oftened averaged. The estimates are from the LRCF, test, or average of LRCF and Test.

Appendix E. 9. Annual Klukshu River weir counts of Chinook, sockeye, and coho salmon, 1976 to 2014.
The escapement count equals the weir count minus the aboriginal fishery harvest above the weir and brood stock taken. The remainder of the food fishery harvest occurred below the weir, at Village Creek, and Blanchard and Takhanne Rivers. Jack Chinook salmon are included in Chinook counts.
Coho counts are partial counts; weir is removed prior to the end of the run.

${ }^{\text {a }}$ A low weir count resulted in a bilateral inseason adjustment of the egg take target to 5.5 million.
${ }^{\mathrm{b}}$ The original goal of 6.0 million eggs at Tahltan Lake was reduced to 5.0 million by Canada due to domestic issues.
