## LIST OF TABLES

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, and troll fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2015.................................. 21
Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2015.
.......................................................................................................................................... 24
Table 3. Terminal run reconstruction for Stikine River sockeye salmon, 2015. .............. 26
Table 4. Taku sockeye salmon run reconstruction, 2015. Estimates do not include spawning escapements below the U.S./Canada border. .47
Table 5. U.S. inseason forecasts of D111 terminal run size, total allowable catch, inriver run size, and the U.S. harvest of wild Taku River sockeye salmon for 2015
Table 6. Weekly large Chinook salmon guideline harvest for the Canadian assessment fishery in the Taku River for 2015. .55
Table 7. Forecasts of terminal run size, allowable catch (AC), weekly guidelines, and actual catch of Taku River large Chinook salmon, 2015................................................... 57
Table 8. Canadian inseason forecasts of terminal run size, total allowable catch (TAC), and spawning escapement of wild Taku sockeye salmon, 2015.
Table 9. Harvest and Klukshu index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2015.

## LIST OF FIGURES

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.19

Figure 2. The Taku River and principal U.S. and Canadian fishing areas...................... 44
Figure 3. The Alsek River and principal U.S. and Canadian fishing areas .66

## LIST OF APPENDICES

Appendix A. 1. Weekly harvest of Chinook salmon in the U.S. gillnet, troll, recreational,and subsistence and estimates of Stikine River bound Chinook salmon in District 108,2015.76
Appendix A. 2. Weekly harvest of Chinook salmon in the Canadian commercial, Telegraph Aboriginal, and recreational fishery in the Stikine River, 2015. ..... 76
Appendix A. 3. Weekly harvest of Chinook salmon in the Canadian test fisheries in the Stikine River, 2015. ..... 77
Appendix A. 4. Weekly harvest of sockeye salmon in the Alaskan District 106 and 108 fisheries, 2015. ..... 77
Appendix A. 5. Weekly stock proportions of sockeye salmon harvested in the Alaskan D106 commercial drift gillnet fishery, 2015 ..... 78
Appendix A. 6. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2015 ..... 79
Appendix A. 7. Weekly stock proportions of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2015. ..... 80
Appendix A. 8. Weekly stock proportions sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2015. ..... 81
Appendix A. 9. Weekly sockeye salmon harvest and effort in the Canadian commercial and assessment fisheries in the lower Stikine River, 2015. ..... 82
Appendix A. 10. Weekly sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery in the lower Stikine River, 2015. ..... 83
Appendix A. 11. Harvest by stock and week for sockeye salmon in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2015. ..... 84
Appendix A. 12. Weekly harvest, CPUE, and migratory timing of Tahltan, Tuya, and mainstem sockeye salmon stocks in the Stikine River test fishery, 2015 ..... 85
Appendix A. 13. Daily test harvest taken from the Tuya Assessment Fishery located above the Tahltan River, July 2015. ..... 85
Appendix A. 14. Weekly coho salmon harvest in the Alaskan District 106 and 108 fisheries, 2015 ..... 86
Appendix A. 15. Weekly harvest of coho salmon in the Canadian lower river commercial fishery and test fisheries 2015. ..... 86
Appendix A. 16. Weekly salmon effort in the Alaskan District 106 and 108 fisheries, 2015. ..... 87
Appendix A. 17. Weekly salmon effort in the Canadian fisheries in the Stikine River, 2015. ..... 87
Appendix A. 18. Tuya assessment fishery, 2015 ..... 87
Appendix A. 19. Daily counts of adult sockeye salmon passing through Tahltan Lake weir, 2015. ..... 88
Appendix A. 20. Daily counts of sockeye salmon smolt migrating through Tahltan Lake smolt weir, 2015 ..... 89
Appendix A. 21. Daily counts of adult Chinook salmon passing through Little Tahltan weir, 2015. ..... 90
Appendix B. 1. Historic salmon harvest and effort in the Alaskan District 106 commercial gillnet fishery, 1960-2015. ..... 91
Appendix B. 2 Historic salmon harvest and effort in the Alaskan District 108 commercial gillnet fishery, 1962-2015. ..... 92
Appendix B. 3. Annual harvest of Stikine River large Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2005-2015. ..... 93
Appendix B. 4. Chinook salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2015 ..... 93
Appendix B. 5. Chinook salmon harvest in the Canadian commercial and recreational fisheries in the Stikine River, 1979-2015. ..... 94
Appendix B. 6. Chinook salmon harvest in inriver test fisheries in the Stikine River, 1985- 2015. ..... 95
Appendix B. 7. Index counts of Stikine River large Chinook salmon escapements, 1979- 2015. ..... 96
Appendix B. 8. General stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; District 106 \& 108, 1982-2015 ..... 97
Appendix B. 9. Stikine River stock proportions and harvest of sockeye salmon in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1982-2015. ..... 98
Appendix B. 10. Tahltan sockeye salmon stock proportions and harvest of in the Alaskan commercial gillnet fishery; Districts 106 \& 108, 1994-2015. ..... 99
Appendix B. 11. Stikine River sockeye salmon harvest in the U.S. Subsistence fishery, 2004-2015 ..... 99
Appendix B. 12. Stock proportions of sockeye salmon in the Alaskan District 106 and 108 test fisheries, 1984-2015 ..... 100
Appendix B. 13. All harvest in of sockeye salmon in Canadian commercial and assessment fisheries, 1972-2015. ..... 101
Appendix B. 14. Sockeye salmon stock proportions and harvest by stock in the Canadiancommercial and assessment fishery in the Stikine River, 1979-2015.102
Appendix B. 15. Tahltan sockeye salmon stock proportions and harvest by stock in the Canadian commercial and assessment fishery in the Stikine River, 1979-2015. ..... 103
Appendix B. 16. Tahltan Lake weir data with enhanced and wild Tahltan fish, 1979-2015.104
Appendix B. 17. Sockeye salmon harvest by stock in the Stikine River under Canadian ESSR licenses, 1992-2015. ..... 105
Appendix B. 18. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2015 ..... 106
Appendix B. 19. Aerial survey counts of Mainstem sockeye salmon stocks in the Stikine River drainage, 1984-2015 ..... 107
Appendix B. 20. Stikine River sockeye salmon run size, 1979-2015. ..... 108
Appendix B. 21. Coho salmon harvest in the Alaskan District 106 and 108 test fisheries, 1984-2015........................................................................................................................ 109

Appendix B. 22. Annual harvest of coho salmon in the Canadian lower and upper river commercial, Telegraph Aboriginal and the Canadian test fisheries, 1979-2015. ........... 110
Appendix B. 23. Index counts of Stikine River coho salmon escapements, 19842015.................................................................................................................................. 111

Appendix B. 24. Effort in the Canadian fisheries, including assessment fisheries in the
Stikine River, 1979-2015. ................................................................................... 112 Appendix B. 25. Counts of adult sockeye salmon migrating through Tahltan Lake weir, 1959-2015....................................................................................................................... 113
Appendix B. 26. Estimates of sockeye salmon smolt migrating through Tahltan Lake smolt
weir, 1984-2015. ...................................................................................................... 114 Appendix B. 27. Weir counts of Chinook salmon at Little Tahltan River, 1985-2015. 115 Appendix B. 28. Historical pink and chum salmon harvest in the Canadian fisheries, 19792015................................................................................................................................. 116

Appendix C. 1. Weekly Chinook salmon harvest in the U.S. fisheries in D111, 2015.. 117
Appendix C. 2. Weekly Chinook salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River 2015. .............................................. 117
Appendix C. 3. Weekly sockeye salmon harvest of Alaskan D111 traditional and terminal
common property commercial drift gillnet fishery, 2015......................................... 117
Appendix C. 4. Weekly stock proportions of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery, 2015. ...................................... 118 Appendix C. 5. Weekly sockeye salmon abundance estimates of above border run and
harvest in the Canadian fisheries in the Taku River, 2015. ....................................... 119 Appendix C. 6. Estimates of wild and enhanced sockeye salmon stock harvested in the Canadian commercial fishery in the Taku River by week, 2015..................................... 119 Appendix C. 7. Weekly coho salmon harvest in the traditional Alaskan District 111 and
StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2015.......................... 120
Appendix C. 8. Weekly coho salmon abundance estimates of above border run and harvest in the Canadian fisheries in the Taku River, 2015. ..... 121
Appendix C. 9. Weekly effort in the Alaskan traditional District 111 and StatArea 111-32 (Taku Inlet), commercial drift gillnet fishery, 2015. ..... 121
Appendix C. 10. Weekly effort in the Canadian commercial and assessment fisheries in the Taku River, 2015 ..... 122
Appendix C. 11. Daily counts of adult sockeye salmon passing through Tatsamenie weir, 2015. ..... 123
Appendix C. 12. Daily counts of adult sockeye salmon passing through Little Trapper Lake weir, 2015. ..... 124
Appendix C. 13. Daily counts of adult sockeye salmon passing through the King Salmon Lake weir, 2015. ..... 125
Appendix C. 14. Daily counts of adult sockeye salmon passing through the Kuthai Lake weir, 2015 ..... 126
Appendix C. 15. Daily counts of large Chinook salmon carcasses at the Nakina River weir, 2015. ..... 127
Appendix D. 1. All historic harvest and effort of salmon in the D111 gillnet fishery, 1960- 2015 ..... 128
Appendix D. 2. Annual harvest estimates of Taku River large Chinook salmon in the D111 fisheries, 2005-2015. ..... 129
Appendix D. 3. Annual Chinook Salmon harvest in the Canadian fisheries in the Taku River, 1979-2015. ..... 130
Appendix D. 4. Taku River large Chinook salmon run size, 1979-2015. ..... 131
Appendix D. 5. Aerial survey index escapement counts of large (3-ocean and older) Taku River Chinook salmon, 1975-2015. ..... 132
Appendix D. 6. Annual sockeye salmon harvest in the Alaskan District 111 fisheries, includes estimates of Taku wild and enhanced fish in the gillnet, seine, and personal use fisheries, 1967-2015. ..... 133
Appendix D. 7. Stock proportions and harvest of sockeye salmon in the traditional Alaska District 111 commercial drift gillnet fishery, 1983-2015. ..... 134
Appendix D. 8. Proportion of wild Taku River sockeye salmon in the Alaskan District 111 commercial drift gillnet harvest by week, 1983-2015. ..... 135
Appendix D. 9. Annual sockeye salmon harvest estimates of wild and enhanced fish in the Canadian fisheries in the Taku River, 1979-2015 ..... 136
Appendix D. 10. Annual sockeye salmon stock proportions and harvest by stock in the Canadian commercial fishery on the Taku River, 1986-2015. ..... 137
Appendix D. 11. Annual sockeye salmon weir counts, escapements, and samples at the Tatsamenie weir, 1984-2015 ..... 138
Appendix D. 12. Annual sockeye salmon weir counts, escapements, and samples at the Little Trapper weir, 1983-2015. ..... 139
Appendix D. 13. Taku River sockeye salmon run size, 1984-2015 ..... 140
Appendix D. 14. The terminal run reconstruction of Taku wild and enhanced sockeye salmon, 1984-2015. ..... 141
Appendix D. 15. Annual sockeye salmon escapement estimates of Taku River and Port Snettisham sockeye salmon stocks, 1979-2015. ..... 142
Appendix D. 16. Historical Taku River coho salmon harvested in D111 terminal fisheries, 1992-2015 ..... 143
Appendix D. 17. Historical coho salmon in the Canadian fisheries in the Taku River, 1987- 2015 ..... 144
Appendix D. 18. Historic Taku River coho salmon run size, 1987-2015 ..... 145
Appendix D. 19. Escapement counts of Taku River coho salmon. Counts are for age-. 1 fish and do not include jacks, 1984-2015. ..... 146
Appendix D. 20. Historical effort in the Alaskan District 111 and Subdistrict 111-32 (Taku Inlet) commercial drift gillnet fishery, 1960-2015. ..... 147
Appendix D. 21. Historical effort in the Canadian commercial fishery in the Taku River, 1979-2015 ..... 148
Appendix D. 22. Canyon Island fish wheel salmon counts and periods of operation on theTaku River, 1984-2015149
Appendix E. 1. Weekly salmon harvest and effort in the lower Alsek River fisheries, 2015. ..... 150
Appendix E. 2. Weekly salmon harvest and effort in the Canadian Aboriginal and sport fisheries in the Alsek River, 2015. ..... 150
Appendix E. 3. Daily counts of salmon passing through Klukshu River weir, 2015. ..... 151
Appendix E. 4. Chinook salmon harvest in the U.S. fisheries in the Alsek River, 1960 to 2015. ..... 153
Appendix E. 5. Klukshu River run reconstruction of all Chinook salmon, 2005-2015.154
Appendix E. 6. Chinook salmon harvest in the Canadian Aboriginal and recreationalfisheries in the Alsek River, 1976-2015.155
Appendix E. 7. Aerial survey index counts of Alsek River Chinook salmon escapements, 1984 to 2015. ..... 156
Appendix E. 8. Sockeye salmon harvest in the U.S. fisheries in the Alsek River, 1960- 2015. ..... 157
Appendix E. 9. Klukshu River sockeye salmon weir counts, 1976 to 2015. ..... 158
Appendix E. 10. Salmon harvest in the Canadian Aboriginal and recreational fisheries in the Alsek River 1976 to 2015. ..... 159
Appendix E. 11. Alsek River sockeye salmon escapement, 2000-2015. ..... 160
Appendix E. 12. Alsek River sockeye counts from U.S. and Canadian aerial surveys and from the electronic counter at Village Creek, 1985-2015. ..... 161
Appendix E. 13. Coho, pink, and chum salmon harvest in the U.S. fisheries in the Alsek River, 1960-2015 ..... 162
Appendix E. 14. Klukshu River weir counts of coho salmon, 1976-2015 ..... 163
Appendix F. 1. Tahltan Lake egg collection, fry plants, and survivals, 1989-2015. ..... 164
Appendix F. 2. Tuya Lake fry plants and survivals, 1991-2015. ..... 165
Appendix F. 3. Tatsamenie Lake egg collection, fry plants, and survivals, 1989- 2015. ..... 166
Appendix F.4. Trapper and King Salmon lakes egg collection, fry plants, and survivals, 1990-2015. ..... 166
Appendix G. 1. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 commercial drift gillnet, 2015. ..... 168
Appendix G. 2. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 108 sport fisheries, 2015. ..... 169
Appendix G. 3. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 commercial drift gillnet, 2015. ..... 170
Appendix G. 4. Annual stock proportion estimates (mean) of Chinook salmon harvested in the Alaskan District 111 sport fisheries, 2015. ..... 171

Appendix G. 5. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan Subdistrict 106-41/42 (Sumner Strait) commercial drift gillnet fishery, 2015. 172
Appendix G. 6. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan Subdistrict 106-30 (Clarence Strait) commercial drift gillnet fishery, 2015 .173
Appendix G. 7. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 108 commercial drift gillnet fishery, 2015. 174
Appendix G. 8. Weekly stock proportion estimates (mean) of sockeye salmon harvested in the Alaskan District 111 traditional commercial drift gillnet fishery by week, 2015...... 175

## ACRONYMS

| ADF\&G | Alaska Department of Fish and Game |
| :--- | :--- |
| AC | Allowable Catch |
| AF | Aboriginal Fishery |
| BLC | Base Level Catch |
| CAFN | Champagne Aishihik First Nation |
| CCPH | Cumulative Catch per Hour |
| CPUE | Catch per unit effort |
| CWT | Coded Wire Tag |
| DFO | Department of Fisheries and Oceans (Canada) |
| DIPAC | Douglas Island Pink and Chum (Private Hatchery) |
| ESSR | Excess Salmon to Spawning Requirement (surplus fishery license) |
| GSI | Genetic Stock Identification |
| IHNV | Infectious Hematopoietic Necrosis (a virus which infects sockeye salmon) |
| LCM | Latent Class Model |
| MEF | Mid Eye Fork (fish length measurement) |
| MR | Mark-Recapture |
| MSY | Maximum Sustained Yield |
| POH | Post-Orbital-Hyperal (fish length measurement) |
| PSC | Pacific Salmon Commission |
| PST | Pacific Salmon Treaty |
| SCMM | Stikine Chinook Management Model |
| SHA | Special Harvest Area |
| SMM | Stikine Management Model |
| SPA | Scale Pattern Analysis |
| SW | Statistical Week |
| TAC | Total Allowable Catch |

## EXECUTIVE SUMMARY

Final estimates of harvests and escapements of Pacific salmon returning to the transboundary Stikine, Taku, and Alsek rivers for 2015 are presented and compared with historical patterns. Average, unless defined otherwise, refers to the most recent 10-year average (2005-2014). Relevant information pertaining to the management of appropriate U.S. and Canadian fisheries is presented and the use of inseason management models is discussed. Results from TBR sockeye salmon Oncorhynchus nerka enhancement projects are also reviewed.

## Stikine River

The postseason estimate of the 2015 Stikine River sockeye salmon terminal run was 174,300 fish, of which approximately 93,900 fish were harvested in various fisheries including assessment/test fisheries. An estimated 93,900 Stikine River fish escaped to spawn, including 20,900 fish that migrated to the barrier in the Tuya River that were not harvested. The terminal run was 5,000 fish below average and the harvest was 20,400 fish below average. The Tahltan Lake sockeye salmon total escapement of 33,200 fish was above the goal range of 18,000 to 30,000 fish. The estimated U.S. commercial harvest of Stikine River sockeye salmon in Districts 106 and 108, including the Stikine River subsistence fishery, was 32,000 fish. The sockeye salmon harvest in the Canadian inriver commercial was 51,900 fish and the AF harvest was 8,200 fish. The inriver test fisheries harvested 1,900 sockeye salmon. Weekly inseason run projections from the SMM ranged from 103,700 to 227,800 sockeye salmon; the final inseason model prediction was 227,800 fish, with a TAC of 159,800 fish. Weekly inseason run projections using other methods in concert with the SMM ranged from 128,200 to 217,500 sockeye salmon; the final inseason run size based on this approach was 198,800 sockeye salmon with a TAC of 124,700 fish. Based on the final postseason run size estimate of 174,300 fish and an AC estimate of 51,300 Stikine River sockeye salmon for each country, Canada harvested $117 \%$ and the U.S. harvested $62 \%$ of their respective TACs. Brood stock collection removed 3,900 sockeye salmon from the escapement to Tahltan Lake leaving a natural spawning escapement of 29,300 fish. The estimated spawning escapement of 26,400 mainstem Stikine River sockeye salmon was within the goal range of 20,000 to 40,000 fish for this stock group.

The 2015 Stikine River large Chinook salmon run was estimated at 27,000 fish, of which approximately 5,700 fish were harvested in various fisheries. The estimated escapement of Stikine River large Chinook salmon was 21,600 fish; above the escapement goal of 17,400 fish and within the escapement goal range 14,000 to 28,000 fish. The run and harvest were below their respective averages. The Little Tahltan River large Chinook salmon escapement of 450 fish was below the Canadian escapement target of 3,300 fish and below the lower bound of the Canadian target range of 2,700 to 5,300 fish. The estimated U.S. commercial harvest of Stikine River Chinook salmon in Districts 108 gillnet, test, troll, subsistence, and sport fisheries was 1,400 fish. The estimated Canadian commercial, Aboriginal, assessment/test, and sport fisheries harvest was 4,300 fish. Managers used harvest in the MR, model, and other assessment estimates to generate inseason run sizes
after SW 25. The inseason run projections were consistent throughout the course of the fishery in predicting a terminal run size that was close to the preseason expectation of 30,200 large Chinook salmon. Weekly inseason run projections ranged from 28,000 to 29,300 large Chinook salmon.

The 2015 run size of Stikine River coho salmon cannot be quantified. The U.S. harvest of Stikine River coho salmon is also unknown since there is no stock identification program for this species. Mixed stock coho salmon harvest in District 106 was 112,600 fish (51\% Alaska hatchery) and District 108 was 30,200 fish ( $23 \%$ Alaska hatchery). The Canadian inriver coho salmon harvest of 5,600 fish was above average. The annual aerial surveys indicated a below average return to the 6 index sites that were surveyed by Canada. The inseason weekly CPUE of coho salmon from both the lower Stikine River Canadian fishery and sockeye salmon test fishery (incidentally harvested coho salmon) was below average.

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m}^{3}$ of debris into the river which blocked access to Tahltan River Chinook and sockeye salmon spawning sites until mid-July 2014. Remedial work was done to improve fish passage at the landslide in March 2015. It appeared that the landslide continued to restrict upstream passage, especially during periods of high water in 2015. The extent of the restriction on upstream salmon passage will be evaluated in early 2016 after radio telemetry data analysis is completed.

## Taku River

The postseason estimate of the 2015 Taku River sockeye salmon terminal run was 194,400 fish, 193,400 wild fish and 1,000 hatchery fish. The U.S. harvested 41,800 Taku River wild fish, Canada harvested 19,700 wild fish and the estimated above border spawning escapement was 131,900 wild sockeye salmon. The terminal run size was above average and the wild escapement was well above average for the same time period and well above the goal range of 71,000 to 80,000 fish. The U.S. harvested an estimated $44 \%$ of the U.S. AC and Canada harvested an estimated $55 \%$ of the Canadian AC.

The estimated 2015 Taku River large Chinook salmon terminal run was 32,060 fish; above border run was 31,270 fish and spawning escapement was 28,830 fish. The run was average and the harvest was below average. The total harvest of large Chinook salmon in the inriver assessment/test fishery and Canadian commercial, Aboriginal, and recreational fisheries in the Taku River was 2,450 fish. The traditional District 111 mixed stock drift gillnet fishery total harvest of 1,080 Chinook salmon was below average even when excluding those years in which a directed Chinook salmon fishery occurred.

The estimated above border run of Taku River coho salmon in 2015 was 70,400 fish, which was below average ( $67 \%$ of average). The Canadian inriver commercial harvest was 7,900 coho salmon with an additional 2,000 fish harvested in the assessment/test fishery and 300 fish harvested in the Aboriginal fishery. After all Canadian harvests were subtracted from the above border run the above border spawning escapement was estimated at 60,200 coho salmon, which exceeds the lower bound of the newly adopted escapement goal range of 50,000 to 90,000 fish. The U.S. harvest of 23,200 coho salmon in the traditional District

111 mixed stock fishery was well below average. Alaskan hatcheries contributed an estimated 4,800 fish; 21\% of the District 111 harvest.

#### Abstract

Alsek River The 2015 Alsek River harvest of 16,100 sockeye salmon in the U.S. commercial fishery was average. The Canadian inriver recreational fishery reported no sockeye salmon harvest while the Aboriginal food fishery harvest was approximately 1,100 fish. The Klukshu River weir count of 11,600 sockeye salmon was average and was above the escapement goal range of 7,500 to 11,000 fish. The count of 2,600 early run sockeye salmon (i.e. through August 15) and the late run count of 9,000 were both average.

The Chinook salmon run to the Alsek River was above average. The U.S. Dry Bay harvest of 240 large Chinook salmon was below average. The Canadian recreational fishery harvest of 40 fish was average and the Aboriginal harvest of 90 fish was above average. The 1,430 Chinook salmon counted through the Klukshu River weir was above average and the estimated escapement of 1,390 fish was above the escapement goal range of 800 to 1,200 Chinook salmon.

Current stock assessment programs prevent an accurate comparison of the Alsek River coho salmon run with historical runs. There was minimal effort during the U.S. Dry Bay coho salmon fishery and harvest figures are negligible. The Canadian recreational and Aboriginal fisheries harvested no coho salmon. The operation of the Klukshu River weir does not provide a complete enumeration of coho salmon into this system since it is removed before the run is over.

## Enhancement

In 2015, eggs and milt were collected from sockeye salmon escapements at Tahltan and Tatsamenie lakes. A total of approximately 4.5 million eggs were collected at Tahltan Lake and 731,000 at Tatsamenie Lake. Prior to the start of egg collection at Tahltan Lake, Canada advised Alaska that they were revising the goal to 5.5 million eggs (from 6.0 million eggs) because of a decision they had made to stop releases into Tuya Lake; their technical staff had determined that the fry from a 5.5 million level egg take could all be planted into Tahltan Lake without exceeding agreed to stocking guidelines. The revised egg-take goal at Tahltan Lake was not achieved. The egg-take goal of 2 million eggs at Tatsamenie Lake was not achieved due to low escapement however the alternative target of $30 \%$ of the female escapement used for broodstock was applied to the project as per the bilaterally agreed Taku Enhancement Production Plan.

In 2015, outplants of brood year 2014 sockeye salmon fry were as follows: 2.68 million fry into Tahltan Lake; 731,000 fry and 187,000 extended-rearing fry into Tatsamenie Lake. Green-egg to planted-fry survivals were $76 \%$, and $87 \%$ for Tahltan, and Tatsamenie lakes; respectively. An estimated 169,700 pre-emergent fry from one Tatsamenie Lake stock incubator were confirmed positive with IHNV and destroyed.

Adult sockeye salmon otoliths were processed inseason by the ADF\&G otolith lab to estimate weekly contribution of fish from U.S./Canada TBR fry planting programs to District 106, 108, and 111 gillnet fisheries and to Canadian commercial fisheries in the Stikine and Taku rivers. Contribution estimates of stocked fish to Alaskan harvests were 14,400 stocked Stikine River fish to District 106 and 108, and 200 stocked Taku River fish to District 111. Estimates of contributions to Canadian fisheries included 29,092 stocked fish to Stikine River fisheries and 130 stocked fish to the Taku River fisheries.

## INTRODUCTION

This report presents estimates of the 2015 harvest and escapement data for Pacific salmon runs to the transboundary Stikine, Taku, and Alsek rivers and describes management actions taken during the season. Harvest and effort data are presented by week, for each river for both U.S. and Canadian fisheries. Spawning escapement data for most species are reported from weir counts or other escapement monitoring techniques. Joint enhancement activities on the Stikine and Taku rivers are also summarized.

The TTC met prior to the season to update joint management, stock assessment and enhancement plans and determine preseason forecasts and outlooks for run strengths and initial TAC estimates for the various species and rivers. The results of this meeting are summarized in: PSC TTC, TCTR (15)-1 Salmon Management and Enhancement Plans for the Stikine, Taku and Alsek Rivers, 2015.

Run reconstruction analyses were conducted on the sockeye salmon Oncorhynchus nerka and Chinook salmon O. tshawytscha runs returning to the Stikine and Taku rivers and for the coho salmon $O$. kisutchrun returning to the Taku River. No estimates of marine harvest are made for Alaskan fisheries outside of District 106 and 108 for Stikine River stocks, District 111 for Taku River stocks and Subdistrict 182-30 \& 31 for Alsek River stocks.

## STIKINE RIVER

Stikine River salmon are harvested by U.S. commercial gillnet and troll fisheries as well as recreational and subsistence fisheries in Alaskan Districts 106 and 108, by Canadian commercial gillnet and assessment/test fisheries located in the lower and upper Stikine River, and by a Canadian AF in the upper portion of the river (Figure 1). In addition, Canadian terminal area fisheries are occasionally operated in the lower Tuya River and/or at Tahltan Lake when escapements are estimated to include excess salmon to spawning requirements (ESSR). A recreational fishery also exists in the Canadian sections of the Stikine River drainage. In 1995, a U.S. personal use fishery was established in the lower Stikine River; no harvests were reported in this fishery in 1995 through 2000. Approximately 30 sockeye salmon were harvested in 2001, and the personal use fishery on the Stikine River was not open in 2002 and 2003. A U.S. subsistence fishery was opened in 2004 for sockeye salmon and in 2005 for Chinook and coho salmon.

In 1993, the U.S. spring experimental troll fishery near Wrangell was expanded to include two new areas in portions of District 106 and 108 to target hatchery Chinook salmon. In 1998 an additional area was included in a portion of District 108. The three areas in District 108 and one area in District 6 have remained unchanged and have opened in the absence of District 108 directed Stikine River Chinook salmon fisheries.

In May 2014, a landslide occurred near the mouth of the Tahltan River. The landslide deposited approximately $8,000 \mathrm{~m}^{3}$ of debris into the river which blocked access to Tahltan River Chinook and sockeye salmon spawning sites until mid-July. In March 2015 select boulders at the landslide were demolished using an industrial expansion compound set into drill holes within the boulders. The resulting fragments were displaced downstream by
manual labor and by the erosional effects of the spring freshet. The exercise resulted in an increase in the channel width, ridding the site of a "pinch point" where it was observed that salmon struggled in their attempts to ascend the river in 2014. From late May to late June 2015, Chinook salmon were observed attempting to negotiate the landslide; no observation of fish succeeding in transiting the site was made until 30 June, when Tahltan River flows started to drop. Radio telemetry data, however, indicated the first radio tagged fish passed the weir on 28 June (on average approximately $50 \%$ of the fish enter the Tahltan River by late June). An assessment of the fate of early entry Tahltan River Chinook salmon will be done when the radio telemetry analyses is completed.

Figure 1. The Stikine River and principal U.S. and Canadian fishing areas.

## Harvest Regulations and the Joint Management Model

Fishing arrangements in place for salmon originating from the Canadian portion of the Stikine River watershed are provided in Annex IV, Chapter 1 of the PST and can be found at: http://www.psc.org/publications/pacific-salmon-treaty/. These arrangements include: directed fisheries for Chinook salmon; continuation of a U.S. subsistence fishery on Chinook, sockeye, and coho salmon stocks within the U.S. section of the Stikine River; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the presumed production of enhanced fish.

As in most previous years, the TTC met prior to the season to update joint management and enhancement plans, develop run forecasts, and determine new parameters for input into the inseason Chinook and sockeye salmon run projection models. The Chinook salmon model is referred to as the SCMM and served as a key management tool governing weekly fishing regimes for Stikine River Chinook salmon. The SCMM, however, was complemented inseason with a concurrent MR study and other inriver assessment methods. The sockeye salmon model is referred to as the SMM. The SMM was complemented inseason with concurrent inriver run size estimates based on fishery performance against historical fishery performance and run size estimates.

## Chinook Salmon

The SCMM model is based on the linear regression (correlation) between weekly cumulative CPUE of large Chinook salmon at the tagging site, located near the mouth of the Stikine River, and terminal run size based on MR studies conducted in 1996-2015. Most of the CPUE and run size data sets (CPUE vs. run size) are significantly correlated. Inseason model estimates were available commencing in SW 24 (Table 1). Mark-recapture estimates based on the cumulative ratio of tagged-to-untagged fish observed in the inriver commercial fishery were generated commencing in SW 26. In order to abide by Annex IV, Chapter1, Paragraph 3(a)(3)(vii), which obliges the Parties to apportion their overall TAC by historical weekly run timing, weekly fishery openings were announced based on weekly guideline harvests.

The preseason run size estimate of 30,200 large Chinook salmon was above the threshold run size limit of 28,100 fish (Table 1); hence, triggering the option to conduct a directed Chinook salmon fisheries in the U.S. and Canada. The threshold number is the sum of the midpoint escapement goal (21,000 fish) + the Canadian BLC ( 2,300 fish ) + the U.S. BLC ( 3,400 fish) + the inriver assessment/test fishery harvest ( 1,400 fish). In conjunction with the AC associated with the directed fishery, both U.S. and Canada are permitted a base level catch harvested as bycatch taken in the course of the targeted sockeye salmon net fisheries and Chinook salmon taken in traditional recreational fisheries.

Table 1. Stikine River large Chinook salmon run size based on the Stikine Chinook Management Model and mark-recapture estimates, and other methods, and weekly inseason harvest estimates from the District 108 gillnet, sport, and troll fisheries and the inriver assessment/test, Canadian gillnet, and sport fisheries, 2015.

${ }^{\text {a }}$ Average of mark-recapture and SCMM

The preseason forecast for the Stikine River large Chinook salmon terminal run was approximately 30,200 large Chinook salmon (Table 1), which indicated a run size characterized as below average. Joint Canadian and U.S. inseason predictions of terminal run size ranged from 28,100 to 29,300 large Chinook salmon (Table 1). Managers used the daily harvest and effort data transmitted from the Kakwan Point tagging site and from the commercial fishing grounds to make weekly run projections based on the SCMM and MR models. Joint weekly run size estimates were calculated on Wednesday or Thursday of the current week and were used to set the following week's fishery openings. Given the paucity
of spaghetti tags recovered inseason and the usually high flows affecting catching performance which drives the management model, managers used the preseason forecast for the entirety of the Chinook salmon fishing season (SW's 19-25). The first inseason estimate was generated in SW 26, the initial week of the targeted sockeye fishery. Based on MR data from the inriver commercial fishery tag recoveries and tag recoveries from Verrett and Little Tahltan river escapement sampling, and the U.S. harvest from District 108, the postseason estimate of the terminal run size of Stikine Chinook salmon was 27,354 large Chinook salmon, below the final inseason estimate of 29,300 large Chinook salmon (Table 1). The 2015 Little Tahltan escapement of 450 large Chinook salmon represents 2\% of the total Stikine River escapement of 21,300 large fish, compared to the average of approximately 9\%. (An estimate mortalities resulting from the 2014 Tahltan River landslide will be generated upon the final analysis of a Chinook salmon radio telemetry project conducted in 2015.)

## Sockeye Salmon

The preseason forecast for the Stikine River sockeye salmon run was approximately 171,200 fish (Table 2), and characterized as a below average run. The forecast included approximately 50,400 natural Tahltan sockeye salmon, 31,100 enhanced Tahltan fish, 34,000 enhanced Tuya sockeye salmon, and 55,700 mainstem sockeye salmon. The preseason forecast was used in SW 26 for the inriver fishery. After SW 26, Canada used the SMM and other methods to generate weekly run sizes. The U.S. used the SMM beginning in SW 28 for District 106 and 108.

In 2015, Canada was obligated under Annex IV, Chapter 1, Paragraph 4 of the PST to take corrective actions to bring future catches in alignment with Treaty provisions. This paragraph was triggered given that Canada exceeded its Treaty harvest share of sockeye salmon on three occasions during the past five years. As such, Canada reduced its lower commercial fishery TAC of sockeye salmon by $10 \%$, which was close the overage in TAC observed since 2010.

Starting in SW 27, weekly inputs of the harvest, effort, and stock composition were entered into the SMM to provide weekly forecasts of run size and TAC. Specific inputs include proportion Tahltan/Tuya from egg diameters, proportion enhanced Tuya from thermal mark analyses of otoliths in the Canadian lower river test (when in operation) and commercial fisheries; the upper river harvest in the AF and upper river commercial fishery; the catch, effort and assumed stock composition in Subdistrict 106-41 (Sumner Strait), Subdistrict 106-30 (Clarence Strait), and District 108.

The SMM provides inseason projections of the Stikine River sockeye salmon run, including: the Tahltan stock (wild and enhanced combined); the stocked Tuya stock; and the mainstem stocks. The SMM uses linear regression by historical stock specific harvest data to predict run size from cumulative CPUE for each week of the fisheries. It breaks the stock proportions in District 106 and 108 harvests, from historical postseason scale pattern analysis (SPA) into triggers of run size for Tahltan and Mainstem; the averages used each week depended upon whether the run was judged to be below average ( $0-40,000$ fish), average (40,000-80,000 fish), or above average (+80,000 fish). The SMM for 2015 was
based on CPUE data from 1994 to 2011 from the Alaska District 106 fishery and the Canadian commercial fishery in the lower river and from the lower Stikine River test fishery from 1986 to 2004. The enhanced Tuya and Tahltan stock proportions are adjusted inseason based on the analysis of otolith samples taken in Districts 106 and 108.

Generally, the SMM has used the Canadian Lower River Commercial (LRCF) fishery CPUE to estimate the inriver run size; however, the Lower River Test fishery CPUE data was available to enter into the SMM model to compare and contrast the respective run sizes generated from each of the inputs. In 2015 the upper commercial fishing zone (Flood fishery) was not opened for harvest; in years that it is opened, the harvest and effort from this area are excluded from the CPUE and not used in the model estimate. The annual weekly CPUE values were adjusted in order to make the current year data comparable with historical CPUE. For example, during 1979-1994 and 2000-2004, 2010-2014, only one net per licence was permitted, while in 1996-1999 and 2005-2009 two nets per license were allowed. Only one net was permitted in the 2015 fishing season and the model was adjusted accordingly.

In 2014 and 2015 a new model was tested: the Stikine Forecasting Management Model (SFMM). This model was based on a second order polynomial relationship between weekly cumulative harvest or CPUE in District 106-41 and yearly run size. Triggers of run size for the Tahltan stock were $\leq 98,000$ fish or $>98,000$ fish in the District 106-41 fishery, and 0, $<46,000$ fish, or $>175,000$ fish in the District 108 fishery. Triggers were not used for the mainstem stock. Additional model runs using cumulative harvest or CPUE in the District 108 sockeye salmon area was also tested. The sockeye salmon area harvest and CPUE in District 108 does not include 108-20 and 108-10 fishing areas, or midweek openings.

Table 2. Weekly forecasts of run size and total allowable harvest for Stikine River sockeye salmon as estimated inseason by the Stikine Management Model and other methods, 2015.

${ }^{\text {a }}$ Does not include test fishery harvest
The weekly inputs to the Canadian produced Tahltan sockeye salmon regression model included the cumulative weekly CPUE of Tahltan Lake sockeye salmon (1998-2008: from SW's 28 to 33 all correlations were significant and ranged from an $r^{2}$ of 0.67 in SW 28 to an $r^{2}$ of 0.91 SW 33). The contribution of Tuya origin sockeye salmon was based on otolith marks and presented as a ratio of the total Tahltan run size. The contribution of mainstem sockeye salmon was based on egg diameter measurements and presented as a ratio of total Tahltan run size or calculated based on a regression of cumulative CPUE against the inriver run size (1998-2008: from SW 28 to 33 all correlations were significant and ranged from an $r^{2}$ of 0.31 in SW 28 to an $r^{2}$ of 0.64 SW 33). The contribution of Tuya sockeye salmon (thermal marks) and mainstem sockeye salmon (large eggs) were expressed as a ratio of the total Tahltan Lake run. Preliminary results of thermal mark analyses were available inseason for the marine and lower river fisheries to account for Tuya production in the model and reduce the risk of over estimating the TAC of Tahltan sockeye salmon.

Canadian inseason predictions of terminal run ranged from 128,300 to 217,500 sockeye salmon; U.S. forecasts ranged from 103,700 to 227,800 fish (Table 2). Differences in U.S. and Canadian weekly predictions are due to different approaches to assessing the inseason
run size, with Canada electing to forego the SMM estimates exclusively and use the run reconstruction and Tahltan/mainstem sockeye salmon regression assessment methods in concert with the model estimate for all of the fishing season; the U.S. used the SMM exclusively in assessing weekly run sizes.

The inseason SMM model estimate (SW 34) of 82,366 inriver Tahltan Lake sockeye salmon, minus the inriver harvest of 25,596 fish, resulted in a projected escapement 56,764 Tahltan Lake sockeye salmon, above the Tahltan Lake weir count of 33,159 fish. The final inseason estimates using "other" management tools including the regression model that generates inriver Tahltan Lake sockeye salmon run size and Tahltan escapement from Tahltan sockeye salmon CPUE (commercial CPUE) in concert with the SMM, generated an escapement of 50,837 sockeye salmon: also well above the final weir count of 33,159 fish. It is common for inseason estimates to differ from postseason analysis; this may be attributed to late or protracted run timing and other influences not considered by the model such as environmental conditions.

Table 3. Terminal run reconstruction for Stikine River sockeye salmon, 2015.

${ }^{\mathrm{f}}$ Does not include ESSR or test fishery Harvestes.
${ }^{\mathrm{g}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for Harvestes other than in the listed fisheries.

## U.S. Fisheries

District 106 drift gillnet fishery salmon harvest was above average for 2015 , but was variable by species and included: 2,723 Chinook, 121,921 sockeye, 112,561 coho, 224,816 pink, and 232,390 chum salmon. Chum salmon harvest was well above average, Chinook and sockeye salmon harvest were above average, and coho and pink salmon harvest were below average. An estimated 1,726 Chinook salmon in the District 106 harvest (63\%) were of Alaska hatchery origin. An estimated 14,028 Stikine River sockeye salmon were harvested in District 106, approximately 11\% of the harvest. An estimated 58,877 coho salmon in the District 106 harvest were of Alaska hatchery origin.

Stikine River sockeye salmon harvests in the two major fishing areas of District 106 were again markedly different. The Sumner Strait fishery (Subdistrict 106-41/42) harvested an estimated 12,947 Stikine River sockeye salmon, contributing $18 \%$ of the total sockeye salmon harvest in that subdistrict. The Clarence Strait fishery (Subdistrict 106-30) harvested an estimated 1,080 Stikine River sockeye salmon, contributing $2 \%$ of the total sockeye salmon harvest in that subdistrict.

Effort in the District 106 drift gillnet fishery was below average most weeks, with the exception of SW30 through SW33, and ended with a season total of 2,402 boat days in 2015. District 106 was open for a near average 47 days from June 15 through September 29.

In 2015, District 108 drift gillnet salmon harvest was below average and included: 13,845 Chinook, 22,896 sockeye, 30,153 coho, 35,926 pink, and 166,009 chum salmon. Harvests of Chinook and chum salmon were above average, coho salmon harvest was average, and sockeye and pink salmon harvests were below average. Large Chinook salmon harvested in District 108 drift gillnet fishery from SW’s 25 through 29 totaled 7,991 fish. Genetic stock analysis identified 378 of the large Chinook salmon harvested during SW’s 25 through 29 as above border Stikine River origin. The District 108 drift gillnet fishery harvested an estimated 16,087 Stikine River sockeye salmon, contributing to $70 \%$ of the District 108 sockeye salmon harvest. An estimated 23\% (7,030 fish) of the District 108 coho salmon harvest were of Alaska hatchery origin.

Effort in the District 108 drift gillnet fishery was below average most weeks, with the exception of SWs 30 through 34, and ended with a season total of 1,989 boat days in 2015. District 108 opened on June 15 and closed for the season on September 29 for a total of 50 days open, which is below average when excluding years with a directed Stikine River Chinook salmon fishery.

In 2015, U.S. Federal subsistence fisheries targeting Chinook, sockeye, and coho salmon occurred on the Stikine River and were managed by the USFS. Subsistence fishing was restricted to federally qualified users and required a permit issued by the USFS to participate and was restricted from marine waters to the U.S./Canadian border. Fishing in "clearwater" tributaries, side channels, or at stock assessment sites was also prohibited. Annual guideline harvest levels were 125 Chinook, 600 sockeye, and 400 coho salmon.

Allowable gear for the fishery included: dipnets, spears, gaffs, rod and reel, beach seine, and gillnets not exceeding 15 fathoms in length with mesh size no larger than $51 / 2$ inches, except during the Chinook salmon fishery when nets with mesh up to 8 inches were allowed. Subsistence fishing was allowed from May 15 to June 20 to target Chinook salmon, June 21 to July 31 to target sockeye salmon, and August 1 to October 1 to target coho salmon. In 2015, a total of 125 permits were issued and the estimated harvests included 34 large Chinook, 1,844 sockeye, and 130 coho salmon.

Directed Chinook salmon commercial fisheries did not occur in 2015 for the third consecutive season. The preseason terminal run forecast of 30,200 Stikine River large Chinook salmon resulted in a U.S. AC of 210 fish. An AC of this size did not allow for directed commercial fisheries. However, the U.S. AC allowed for the liberalization of the District 108 sport fishery. Liberalization measures included increased daily and annual bag limits and the use of two rods per person. Inseason forecasts ranging between 28,100 and 29,500 Stikine River large Chinook salmon were similar to the preseason forecast and yielded minimal U.S. ACs. The postseason estimate of the terminal run size based on MR information was 27,354 Stikine River large Chinook salmon resulting in a U.S. AC of 254 fish (Table 1).
U.S. harvest of Stikine River large Chinook salmon in all District 108 fisheries were minimal and well below the U.S. TAC. The spring troll fishery in District 108 began on May 3 and was limited to two hatchery access areas near Anita Bay. Harvest of Stikine River large Chinook salmon in the District 108 troll fisheries was estimated to be 306 fish. The District 108 sport fishery was liberalized on May 1 and harvested an estimated 781 Stikine River large Chinook salmon. A total of large 8 fish were harvested during directed Chinook salmon subsistence fishing. An additional 26 large fish were harvested during the subsistence sockeye salmon fishery for a total of 34 large fish. The U.S. cumulative harvest estimate through SW 29 was 1,499 large fish, well below the U.S. TAC of 3,654 Stikine River large Chinook salmon.

Stikine River sockeye salmon preseason forecast indicated a below average terminal run size of 171,200 fish, with a resulting U.S. AC of 52,800 fish (Table 2). Preseason forecasts were the primary basis used for management during SW's 25 through 27. Inseason estimates of terminal run size were first produced on a weekly basis beginning in SW 27 and were used from SW 28 throughout the end of season with the final inseason estimate produced in SW 33. Inseason abundance estimates were highly variable and ranged between 103,700 and 219,600 fish. The postseason Stikine River sockeye salmon run of 174,292 fish resulted in an U.S. AC of 51,269 sockeye salmon. U.S. harvest of Stikine River sockeye salmon was estimated to be 31,514 fish based GSI analysis (Table 3).

Directed sockeye salmon drift gillnet fisheries in Districts 106 and 108 began in SW 25 at 12:00 noon on Monday, June 15, for an initial period of two days. By regulation, Monday openings occurred during the initial sockeye salmon period. Additionally, area restrictions were implemented in District 108 to conserve Stikine River Chinook salmon during directed sockeye salmon fishing. Limited inseason data and mediocre sockeye salmon harvest derived from the on the grounds surveys indicated the abundance of sockeye
salmon was insufficient to allow additional time in either district. Effort was comprised of 12 boats in Clarence Strait (106-30), 23 boats in Sumner Strait (106-41), and 45 boats in District 108. An estimated 380 Stikine River sockeye salmon were caught in the District 106 and 108 drift gillnet fisheries this week.

Districts 106 and 108 drift gillnet fisheries opened in SW 26 (June 21-June 27) for an initial three days. Fishing time was based on the average forecast of the Tahltan component of the Stikine River sockeye run and near average harvest the prior week. Area restrictions in District 108 were relaxed to the Old Stikine River closure line that restricted fishing to areas beyond the Stikine River delta. During SW 26, 32 boats fished in Sumner Strait, 11 boats fished in Clarence Strait, and 43 boats fished in District 108. On the grounds surveys of the gillnet fleet indicated above average harvest rates and below average effort in both districts, allowing for a one day extension. An estimated 2,900 Stikine River sockeye salmon were caught this week with the majority ( 1,800 fish) being harvested in District 106.

Both districts were opened for an initial four days in SW 27 (June 28-July 4) with no additional time granted. Sockeye salmon harvest rates remained near average with an overall low sockeye salmon harvest in District 108 due to low effort targeting sockeye salmon. There were 33 boats in Sumner Strait, 26 boats in Clarence Strait, and 34 boats in District 108. An estimated 5,900 Stikine River sockeye salmon were caught this week; 3,504 fish in District 106 and 2,410 fish in District 108.

During SW 28 (July 5-July 11), Districts 106 and 108 were opened for an initial three days. Inseason forecast of Stikine River sockeye salmon terminal run size was 103,700 fish with a resultant U.S. AC of 17,600 fish, which was considerably below the preseason forecasts (Table 2). The U.S. cumulative harvest of Stikine River sockeye salmon through SW 27 was 9,200 fish. On the grounds surveys of the gillnet fleet indicated above average sockeye salmon abundance. Additionally, sockeye salmon harvest rates in the Canadian commercial fishery also picked up to above average this week. Consequently, a one day extension occurred in both districts. An estimated 9,700 Stikine River sockeye were harvested during this opening with the harvest evenly split between districts. There were 21 boats in Clarence Strait, 31 boats in Sumner Strait, and 37 boats in District 108.

Assessments during SW 29 (July 12-July 18) provided an increase in the SMM with a projected run size of 123,400 sockeye salmon, which resulted in a U.S. AC of 26,400 fish (Table 2). By this week, it was evident that the SMM was slow to react to the tardiness of the Stikine River sockeye salmon run. Both districts were open for an initial three days. On the grounds surveys of the gillnet fleet indicated below average effort and sockeye salmon harvest. Due to expected low harvest of Stikine River sockeye salmon, and available AC, a one day midweek opening occurred in District 108. An estimated 4,900 Stikine River sockeye salmon were harvested in SW 29 with a cumulative harvest through SW 28 of 15,800 fish. During SW 29, 29 boats fished in Clarence Strait, 30 boats fished in Sumner Strait, and 47 boats fished in District 108.
Run size estimates and corresponding U.S. AC continued to increase in SW 30 (July 19July 25) with a predicted terminal run size of 144,600 Stikine River sockeye salmon, which
resulted in a U.S. AC of 38,600 fish (Table 2.) Both districts were open for an initial three days. On the grounds surveys of the gillnet fleet indicated above average harvest rates in District 106. Although the numbers of vessels fishing in District 108 increased this week, very few targeted sockeye salmon. Due to the low effort in District 108 and available U.S. AC, a one day midweek opening occurred in District 108. An estimated 4,300 Stikine River sockeye salmon were harvested by U.S. fisheries this week. Effort during SW 30 included 34 boats in Clarence Strait, 27 boats in Sumner Strait, and 70 boats in District 108.

Sockeye salmon harvests began to wane in SW 31; however, sockeye salmon harvest rates remained well above average for the remainder of the season. Statistical week 31 (July 26August 1) was the final week for Stikine River sockeye salmon management. Both districts were open for an initial three days beginning July 26. The inseason forecast used for SW 31 estimated a terminal run size of 167,300 Stikine River sockeye salmon with an U.S. AC of 49,600 fish (Table 2). Effort included: 36 boats fishing in Clarence Strait, 28 boats in Sumner Strait, and 76 boats in District 108. On the grounds surveys indicated above average harvest rates of sockeye salmon with average effort in District 106 and below average sockeye salmon effort and harvest in District 108. Due to the anticipated low effort and sockeye salmon harvest in District 108, in combination with the available U.S. AC, a one day midweek opening occurred in District 108. The estimated U.S. harvest of Stikine River sockeye salmon in SW 31 was 1,600 fish with a cumulative harvest through SW31 of 16,600 fish. An estimated 3,500 Stikine River sockeye salmon were harvested in the District 106 and 108 drift gillnet fisheries through the remainder of the season.

During SWs 32 through 35 (August 2-August 29), both Districts 106 and 108 were managed on pink salmon abundance. That portion of Section 6-D in District 106 along the Etolin Island shoreline was closed to gillnet fishing from SW 32 through SW 35 by regulation. Three day openings occurred in SW 32 through 34. SW 35 was open for two days. Effort was above average in both districts for SW 32 and SW 33. Effort remained above average in District 108 for SW 34, but fell below average in District 106 that week. Effort was below average in both districts in SW35.

Beginning in SW 36 (August 30-September 5), management emphasis transitioned from pink salmon to coho salmon abundance. Prior to the switch to coho salmon management, 78,200 coho salmon, approximately 69\%, of the total District 106 had been harvested. The hatchery contribution was approximately 38,800 fish in District 106 fishery prior to SW 36 and was comprised primarily of Neck Lake/Burnett Inlet enhanced summer coho salmon. During the coho salmon management period, coho salmon harvests were below average in District 106 with an estimated harvest of 18,500 hatchery fish and 16,100 wild coho salmon. Harvest of wild coho salmon in District 108 was near average with an estimated harvest of 30,100 fish. Both districts opened for two days during the first week of coho management. Starting SW 37, both districts were opened for three days each week through SW 39 and then open for two days for the final opening in SW 40. The 2015 gillnet season concluded at noon on Tuesday, September 29, in both districts.

Canadian Fisheries

Harvests from the combined Canadian commercial, Aboriginal gillnet and sport fisheries in the Stikine River in 2015 included; 4,232 large Chinook, 1,562 nonlarge Chinook, 60,046 sockeye, 5,619 coho, 179 chum, and 297 pink salmon. In addition 486 pink and 388 chum salmon were released; all of the 733 steelhead caught were released. The annual test/terminal area fishery designed to target on Tuya bound fish at a site located in the mainstem Stikine River between the mouth of the Tahltan and the mouth of the Tuya River was not prosecuted in 2015.

The harvest of large Chinook salmon was below average. Catch of nonlarge Chinook salmon, however, was above average. The sockeye salmon harvest was above average. The estimate of the total contribution of sockeye salmon from the Canada/U.S. fry-stocking program to the combined Canadian Aboriginal and commercial fisheries was 29,092 fish, $47 \%$ of the harvest. The harvest of 5,619 coho salmon was above average.

A sockeye salmon test fishery was conducted for stock assessment purposes in the lower Stikine River from 24 June to 29 August, 2015. The test fishery was located immediately upstream from the Canada/U.S. border. Test fishery harvests totaled 25 large Chinook, 59 nonlarge Chinook, 1,865 sockeye, 33 coho, 4 pink, 11 chum salmon, and 11 steelhead trout (all steelhead trout were released). The objectives of the sockeye salmon test fishery were similar to those in previous years: to provide inseason catch, stock ID and effort data for input, if necessary, into the SMM to estimate the inriver run size; and, to determine migratory timing and stock composition of the sockeye salmon run for use in the postseason estimations of the inriver sockeye salmon run.

Due to budgetary constraints no annual coho salmon test fishery was conducted in the lower Stikine River in 2015.

## Lower Stikine River Commercial Fishery

Canadian commercial fishers in the lower Stikine River harvested 3,134 large Chinook, 1,339 nonlarge Chinook, 51,660 sockeye, 5,619 coho, 297 pink, and 179 chum salmon. A total of 733 steelhead trout were released in 2015; 486 pink and 388 chum salmon were also released. In respect to the catch of large Chinook salmon, 1,891 fish were harvested in a directed Chinook salmon fishery (SW's 19-25) and 1,243 large Chinook salmon were harvested in a directed sockeye salmon fishery (SW's 26-33). The harvests of sockeye, nonlarge Chinook salmon, and coho salmon were above average, while the harvest of large Chinook salmon was below average.

The fleet targeted Chinook salmon for a total of 173 boat days, which was close the average of 189 boat days. Sockeye salmon were targeted for a total of 305 boat days, below the average of 322 boat days. The coho salmon fishery was opened for a total of 148 boat days, above the average of 97 boat days.

Past management actions to change the downward trend of Little Tahltan Chinook run size include late commercial openings, reducing the TAC by $30 \%$ until an inseason estimate is generated (usually 3-4 weeks into the fishery), and reducing the gillnet mesh size during
the sockeye salmon fishery to limit the incidental harvest of Chinook salmon, These actions have not resulted in significant improvements to Chinook salmon spawning abundance in the Little Tahltan River.

The stock composition of the lower river sockeye salmon harvest was as follows: 7,922 enhanced Tahltan fish, which accounted for $12.8 \%$ of the sockeye salmon harvest; 15,002 wild Tahltan sockeye salmon accounting for $25.0 \%$ of the harvest; 13,736 mainstem fish accounting for $22.5 \%$ of the harvest; and, 15,000 enhanced Tuya sockeye salmon accounted for $24.2 \%$ of the harvest (Table 3).

Weekly Chinook and sockeye salmon guideline harvests, based on SCMM, SMM, MR and other forecasts of the TAC apportioned by average run timing and domestic and international allocation agreements, were developed each week to guide management decisions during the Chinook and sockeye salmon seasons. For purposes of managing the lower river catch, 800 large Chinook salmon were allocated to the upper Stikine River commercial and Aboriginal fisheries, after SW 25. The allocation consisted of 100, 20, and 680 large Chinook salmon in the sport, upper commercial and AF, respectively. A total of 8,000 sockeye salmon was allocated to the upper Stikine River commercial and AF. The remaining balance of the Chinook and sockeye salmon TAC was allocated to the lower Stikine River commercial fishery. Particular attention was directed at weekly Chinook salmon guideline harvests and the inriver run and escapement projections of the various sockeye salmon stock groupings. Management through SW 25 was focused primarily on the harvest of large Chinook salmon taken in a directed commercial fishery. From SW 26 through SW 30, management emphasis switched to the Tahltan and Tuya lake sockeye salmon stock groupings, after which time the sole focus was the management of mainstem sockeye salmon stocks through the end of the sockeye salmon fishery in SW 34. Unlike past years, the switch to the mainstem sockeye management commenced in SW 31 vs SW 30. This action was in response to the late entry of both the Tahltan and mainstem sockeye groupings into the commercial fishing grounds in 2015. The coho salmon management regime commenced on SW 35.

The preseason estimate of 30,200 large Chinook salmon was above the treaty agreed to threshold run size of 28,100 fish that triggers a directed fishery. A targeted commercial fisheries, therefore, was prosecuted by Canada.

The Canadian guideline harvests in a directed Chinook salmon fishery were based on an overall AC of 1,890 large Chinook salmon. This TAC was apportioned from SW19 through SW 25. The weekly guideline harvests were derived from historical run timing data from the 2005-2009 inriver commercial fisheries and the 2000-2003, 2010-2014 inriver assessment/test fisheries. During the early component of the directed sockeye salmon fishery, when incidental Chinook salmon catches occurred, weekly guidelines of the Chinook salmon BLC and AC (defined in the PST) were generated using the same run timing as articulated above.

The Chinook salmon directed fishery regime commenced at 0800 hrs, 03 May (SW 19). The sockeye salmon fishery regime (that incidentally harvested Chinook salmon allocated
under the base level allocation and remaining AC available post SW 25) commenced at 1200 hrs 23 June (SW 26). Fishers were limited to one net with a maximum length of 135 metres ( 443 ft .). The maximum mesh size was 203 mm ( 8 in. ) when targeting Chinook or coho salmon, and 140 mm ( 5.5 in .) when targeting sockeye salmon. The fishing zone extended from the Canada/ U.S. boundary to a point near the confluence of the Porcupine and Stikine rivers and the lower 10 km reach of the Iskut River.
(Note: some of the catch figures listed in the following narrative may not match the final catch records listed in the tables. This is due to slight changes in the catches as a result of a postseason check of the catch slips and assessment of Chinook salmon large versus nonlarge size ratios.)

The first directed Chinook salmon fishery opening was posted for 24 hrs commencing at 0800 hrs 03 May, SW 19. The guideline harvest was 108 large Chinook salmon, based on a preseason run size of 30,200 large Chinook salmon and a TAC of 1,890 fish. Fishing conditions were moderate due to extremely low water. The estimated harvest taken after 6 hrs of fishing indicated a projected harvest for a 24 hr period of 104 large Chinook salmon. The fishery was held at 24 hrs. The final catch was 82 large Chinook salmon. The catch per boat day (C/B/D) of 5 large Chinook salmon was slightly below average. The cumulative catch per hour (CPUE) at the Kakwan tagging site was close to average.

The fishery was posted for 24 hrs in SW 20 with a weekly guideline harvest of 168 large Chinook salmon, based on a preseason run size of 30,200 large Chinook salmon and a TAC of 1,890 fish. The estimated harvest after 6 hrs fishing was 17 large Chinook which projected to a total catch over a 24 hr period of 68 large Chinook salmon. This catch prompted a 24 hr extension. The final harvest at the close of this week's 48 hr opening was 105 large Chinook salmon taken under very poor fishing conditions as driven by rapidly rising water. The C/B/D of 3 large Chinook salmon was approximately one quarter of average. The cumulative CPUE at the Kakwan tagging site was only $56 \%$ of average, while the harvest to date taken by the District 108 mixed stock recreational fishery was approximately $47 \%$ of above average.

The fishery was posted for 24 hrs in SW 21 with a weekly guideline harvest of 177 large Chinook salmon, based on a preseason run size of 30,200 large Chinook salmon and a TAC of 1,890 fish. The estimated harvest after 6 hrs fishing was only 10 large Chinook which projected to a total catch over a 24 hr period of 40 large Chinook salmon. This catch prompted a 24 hr extension. The final harvest at the close of this week's 48 hr fishery was 56 large Chinook salmon taken during very poor fishing conditions. The C/B/D of 4 large Chinook salmon was well below the average of 17.5 large Chinook salmon. The cumulative CPUE at the Kakwan tagging site was only $36 \%$ of average. The poor catch was attributed to very poor fishing conditions. The harvest to date taken by the District 108 mixed stock recreational fishery was close to average.

In SW 22 the fishery was posted for 24 hrs with a weekly guideline harvest of 394 large Chinook salmon, based on a preseason run size of 30,200 large Chinook salmon and a TAC of 1,890 fish. Given that only two spaghetti tags were recovered to date and exceptional
poor fishing conditions experienced at the Kakwan tagging site, which provides the metrics for the Chinook model, it was decided to continue to use the preseason run size estimate to govern this week's fish. The estimated harvest after 6 hrs fishing was 35 large Chinook which projected to a total catch over a 24 hr period of 140 large Chinook salmon. The fishery was extended 24 hrs. The estimated catch only 40 large Chinook salmon after 18 hrs fishing in day two prompted a second and final extension of 24 hrs. The final harvest taken in this week's 72 hr fishery was 262 large Chinook salmon taken under very poor fishing conditions. (Note: day three catches showed and improvement). The C/B/D of 4 large Chinook salmon was well below the average of 14 large Chinook salmon. The cumulative CPUE at the Kakwan tagging site was only $36 \%$ of average, while the harvest to date taken by the District 108 mixed stock recreational fishery was average.

In SW 23 the fishery was posted for 24 hrs with a weekly guideline harvest of 430 large Chinook salmon. Again this week, the paucity of tag returns and poor fishing conditions at the Kakwan site, required to generate an inseason estimate, resulted in defaulting to the preseason forecast of 30,200 large Chinook salmon with a TAC of 1,890 fish. The estimated harvest after 6 hrs fishing was 104 large Chinook salmon which projected to a total catch over a 24 hr period of 416 large Chinook salmon. A second catch estimate of 239 large Chinook salmon taken after 20 hrs of fishing prompted an 8 hr extension. The final harvest taken in this week's 32 hr fishery was 371 large Chinook salmon harvested under fair fishing conditions. (Water level was above average, but "flattened out"). The C/B/D of 26 large Chinook salmon was average. Although the cumulative CPUE at the Kakwan tagging site was only $38 \%$ of average, CPUE specific to this week was over double the average. The harvest to date taken by the District 108 mixed stock recreational fishery was approximately $88 \%$ of average. A below average large Chinook salmon harvest was reported from the AF located upstream near the town of Telegraph Creek, B.C. Given the catches and effort to date it was evident that the run would most likely not exceed expectations leading to next week's fishery, when, on average, the return entering the lower Stikine commercial fishing zone peaks.

The fishery was posted for 24 hrs in SW 24 with a weekly guideline harvest of 376 large Chinook salmon, based on a preseason run size of 30,200 and a TAC of 1,890 large Chinook salmon. The lack of sound data precluded the calculation of an inseason run size estimate again this week. The estimated harvest after 6 hrs fishing was 85 large Chinook salmon which projected to a total catch over a 24 hr period of 340 large Chinook salmon. The fishery was extended for 6 hrs. The final harvest taken in this week's 30 hr fishery was 408 large Chinook salmon harvested under poor fishing conditions. (Water level increased during the course of the fishery). The C/B/D of 29 large Chinook salmon was well below the average of 49 large Chinook salmon. This week's catch and CPUE were disappointing given the expectation of the Chinook salmon run reaching its peak migration timing through the fishery. The cumulative CPUE at the Kakwan tagging site was only 58\% of average, the CPUE specific to this week was also below average. Although the District 108 mixed stock recreational fishery picked up slightly this week, the average catch to date was approximately $74 \%$ of average. The cumulative harvest of 98 large Chinook salmon taken in the upper Stikine River AF fishery was below the average cumulative catch to date. A
total of 4 sockeye salmon was harvested in addition to the catch of large Chinook salmon. One sockeye salmon were harvested in the upper Stikine AF fishery.

The fishery was posted for 24 hrs in SW 25 with a weekly guideline harvest of 349 large Chinook salmon, based on a preseason run size of 30,200 and a TAC of 1,890 large Chinook salmon. For the sixth consecutive week, the lack of sound data precluded the calculation of an inseason run size estimate at the outset of this week's fishery; however, the first inseason run size estimate of 28,100 large Chinook salmon was generated after the weekly closure. The estimated harvest after 20 hrs fishing was 547 large Chinook salmon which projected to a total catch over a 24 hr period of 730 large Chinook salmon, over double the weekly guideline harvest. The final harvest was 671 large Chinook salmon harvested under good fishing conditions (low water). The C/B/D of 63 large Chinook salmon was above the seasonal average of 42 fish. The catch, which exceeded the guideline harvest for this week, was unexpected given that it was assumed that the run peaked in SW 24 when only 408 large Chinook were harvested over a 30 hr period. The cumulative CPUE at the Kakwan tagging site was only $74 \%$ of average. This week's Kakwan CPUE, however, was close to double the average CPUE specific to this week, indicating that the run may be peaking or building toward at peak, albeit a least one week later than average. The District 108 mixed stock recreational fishery was $66 \%$ of average. The incidental CPUE of large Chinook salmon in the District 108 directed drift gillnet sockeye salmon fishery was 22 large Chinook salmon, which was well above average; however, the harvest was presumed to include a large component of non-Stikine large Chinook salmon. A total of 27 sockeye salmon was harvested in the lower Stikine commercial fishery; well below average. The cumulative harvest of 504 large Chinook salmon taken in the upper Stikine AF fishery was slightly above the average cumulative catch; however, the harvest may have been affected by the Tahltan River landslide fish barrier, which may have caused fish to drop downriver from the landslide site into the AF fishing grounds. Although remedial work was done at the Tahltan landslide in March 2015, based on observations at the site and radio telemetry data, there was no evidence that the work resulted improved passage. The Little Tahltan River Chinook salmon weir was installed this week. As expected, no fish transited the weir, nor were any fish observed below the weir due to the probable effects of the Tahltan River landslide. Twenty-eight sockeye salmon were harvested in the upper Stikine AF fishery, well below the seasonal average.

In SW 26 the fishery management focus switched from large Chinook salmon to sockeye salmon, although this was the first week whereby an inseason projection of large Chinook salmon was available. The sockeye salmon management regime was centered on the Tahltan stock group and was scheduled to remain so until SW 29. Fishers were permitted one net only and the commercial fishing grounds remained the same as that defined in the Chinook salmon assessment fishery. The guideline harvest for Chinook salmon was based on the BLC of 1,500 large fish and an AC of approximately 1,000 large Chinook salmon, partitioned by historical run timing through the fishery from SW 26 through to SW 30. Notwithstanding an available TAC of large Chinook salmon, a mesh size restriction of 140 mm ( 5.5 in ) was implemented to maximize sockeye catch and minimize the catch of large Chinook salmon. As a result of this strategy it was assumed that the passage of additional fish to the Tahltan River would provide for an increase in the absolute number of spawners
to sites above the Tahltan River landslide, given that it was expected that only a fraction, if any, of the Chinook salmon entering the Tahltan River to date succeeded in negotiating the constricted river flows around the landslide.

The first targeted sockeye salmon fishery commended in SW 26. The overall sockeye salmon TAC of 52,600 including 28,500 Tahltan Lake sockeye salmon, 11,700 Tuya Lake sockeye salmon and 12,400 mainstem sockeye salmon was based on the preseason run size expectation of 171,200 fish. In accordance with Annex IV, Chapter 1, Para 4 the Tahltan Lake sockeye salmon TAC was reduced $10 \%$ (5,300 fish) to better align Canada's Treaty harvest share agreement, given that Canada exceeded its 50\% TAC allocation in three years over the past five years.

The fishery was posted for an initial 24 period commencing Sunday noon, 21 June, SW 26. The guideline catch for large Chinook salmon was 970 fish and the sockeye salmon guideline harvest was 3,000 fish, including 2,100 Tahltan Lake sockeye salmon. A harvest estimate of approximately 450 Tahltan Lake sockeye salmon and 250 large Chinook salmon after 20 hours of fishing prompted a decision to extend the fishery for an additional 24 hrs. The fleet fished under good fishing conditions due to below average flows, augmented by receding flows as the fishery proceeded. The two day fishery yielded a harvest of 631 large Chinook salmon, 385 nonlarge Chinook salmon, and 1,338 sockeye salmon, including 577 Tahltan Lake sockeye salmon, which was well below the sockeye salmon guideline harvest. The total weekly sockeye salmon harvest was comprised of $51 \%$ Tahltan, $30 \%$ Tuya, and $19 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 19 fish vs. an average of 58 fish. U.S. District 106 and 108 sockeye salmon catches and CPUE were near record lows the previous week (noteworthy is the fact that some of the fleet used larger mesh Chinook salmon gear in SW 25). Based on the U.S. and Canadian catch to date it was evident that the projected sockeye salmon abundance, based on historical run timing, was simply not available for harvest. To note: commercial fishers reported that the average size of sockeye salmon was $25 \%$ below normal. Some of the fleet switched to smaller mesh to improve exploitation rate. There was a concern that an unusually high portion of the return (small fish) was escaping the nets which in turn would artificially dampen the SMM run size estimates, given that the model is driven by CPUE observed in the Canadian fishery. The upper Stikine AF sockeye salmon catch was well below average, while the catch of large Chinook salmon was substantially above average. No Chinook salmon transited the Little Tahltan weir this week; moreover, there was not yet any indication of salmon successfully transiting the landslide flow at the Tahltan River. (Discussion among DFO and Tahltan First Nations ensued around resurrecting a fish salvage operation as was conducted in 2014.)

The fishery was posted for an initial 48 hr period in SW 27 with a Chinook salmon guideline harvest of 776 large fish and a sockeye salmon guideline harvest of 2,900 fish, including 1,900 Tahltan Lake sockeye salmon. The terminal run size dropped after the first 24 hrs of fishing from a preseason expectation of 171,200 sockeye salmon to 117,400 fish. Both the SMM and the inriver regression analysis were used to generate the first inseason sockeye salmon run size estimate. The harvest of approximately 800 Tahltan Lake sockeye salmon and 239 large Chinook salmon after one day of fishing indicated that there was
little room to extend another day. Given the projected catch for a 48 hr fishery and coupled with the substandard C/B/D of Tahltan Lake sockeye salmon the fishery was held at 48 hrs. The fishing conditions were very good due to dropping water levels. The 48 hr fishery yielded a harvest of 382 large Chinook, 258 nonlarge Chinook, and 3,160 sockeye salmon, including 1,508 Tahltan Lake origin fish. This harvest was well below the Chinook salmon guideline harvest of 776 fish and slightly under the Tahltan Lake sockeye salmon guideline harvest of 1,900 fish. The total weekly sockeye salmon harvest was comprised of $48 \%$ Tahltan, $37 \%$ Tuya, and $16 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 41 fish vs. an average of 114 fish. Typically the Tahltan Lake sockeye stock group builds towards a peak migration through the lower Stikine River fishing grounds this week. It appeared that the fish may be late entering the river or the return was exceptionally weak. The preliminary U.S. harvest reported for District 106 and 108 this week was below average. The cumulative sockeye salmon harvest in the AF fishery was 371 fish, which was below average. The Chinook salmon harvest in the AF continued to be well above average. One person was active in the upper Stikine commercial fishery this week and reported a harvest of 13 sockeye salmon. No fish were observed at the Little Tahltan; however, Chinook salmon were finally observed transiting the landslide site on 30 June. The movement of fish through the landslide site coincided with dropping water levels at the Tahltan River.

In SW 28 the fishery was posted for an initial 24 hr period with a guideline harvest of 2,323 sockeye salmon including 1,236 Tahltan Lake sockeye salmon. The run size, generated from the SMM and inriver model in SW 27, of approximately 104,600 sockeye salmon, including 38,800 Tahltan Lake origin fish, was upgraded to 128,200 fish, including 56,600 Tahltan Lake sockeye salmon. The new estimate was based on the estimated catch reported after 20 hrs of fishing. The TAC increased to 8,968 sockeye salmon including 5,989 Tahltan Lake sockeye salmon. Given the projected 24 hr catch of approximately 2,000 Tahltan Lake sockeye salmon and the updated guideline harvest for the stock grouping to 5,989 fish, the fishery was extended for 24 hrs. This week's 48 hr fishery yielded a harvest of 157 large Chinook, 186 nonlarge Chinook, 3 chum, 8 pink and 8,732 sockeye salmon, including a harvest of 5,958 Tahltan Lake sockeye salmon. The Chinook salmon harvest was well below the guideline harvest. The harvest of Tahltan sockeye salmon was well close to guideline harvest of 5,989 fish. The total weekly sockeye salmon harvest was comprised of $68 \%$ Tahltan, $30 \%$ Tuya, and $1 \%$ mainstem sockeye salmon. This week's Tahltan Lake sockeye salmon C/B/D of 133 fish was average. Week 28 marks the historical peak of the Tahltan Lake sockeye salmon through the fishery; catches to date indicate the run may be late. The preliminary U.S. harvest and CPUE estimates from District 106 were above average, whereas catches and CPUE in District 108 were approximate half of average. The upper Stikine AF fishery sockeye salmon catches were below average. One person was active in the upper Stikine commercial fishery this week and reported a harvest of only 21 sockeye salmon. The Chinook salmon catches in upper AF fishery continued to be well above the seasonal average. Radio telemetry information indicated that some of the radio tagged Chinook salmon succeeded in passing above the landslide site; some were holding below the site as well. The first sockeye transited the Tahltan Lake weir this week. The first Chinook salmon was counted through the Little Tahltan River weir as well this week.

In SW 29 the fishery was posted for an initial 24 hr opening with a guideline harvest of 7,257 sockeye salmon, including 4,970 Tahltan sockeye salmon. This week's run size estimate was adjusted recognizing that the run was approximately one week late resulting in a run size of approximately 175,300 sockeye salmon. The estimate was based on averaging the commercial CPUE model and the SMM. The Tahltan Lake component was estimated at 76,200 fish. The estimated catch of 1,800 Tahltan Lake sockeye after 20 hrs of fishing and a projected 24 hr catch of 2,200 fish prompted a 24 hr extension. This week's 48 fishery yielded a harvest of 89 large Chinook, 60 nonlarge Chinook, 15 chum, and 9,231 sockeye salmon. The Tahltan Lake sockeye salmon harvest of 5,247 fish was slightly above the guideline harvest for this week. The total weekly sockeye salmon harvest was comprised of $57 \%$ Tahltan, $35 \%$ Tuya, and $8 \%$ mainstem sockeye salmon. The Tahltan sockeye salmon C/B/D was 146 fish vs. the average of 129 fish. Historically SW 29 marked the end of the Tahltan Lake sockeye salmon management regime; however, given the late timing of Tahltan Lake sockeye salmon, and presumably mainstem sockeye salmon, it was decided that Tahltan Lake sockeye salmon abundance would govern management decision through until SW 30. The upper Stikine AF fishery catches of Chinook and sockeye salmon were well above average for this week; peak fishing activity occurred. The Tahltan Lake weir and Little Tahltan weir counts of sockeye and Chinook salmon respectively were well below average.

In SW 30 the fishery management regime remained focused on Tahltan Lake sockeye salmon abundance. The fishery was posted for an initial 48 hr period with a guideline harvest of 6,742 sockeye salmon, including 5,948 Tahltan Lake sockeye. The terminal run size estimate generated after 24 hrs of fishing changed little from SW 29. Again, the run size estimate was based on both the SMM and the inriver regression model for this week. The catch of 1,500 Tahltan Lake sockeye taken during the first 24 hrs of the opening prompted a 24 hr extension. This week's 72 hr fishery yielded a harvest of 43 large Chinook, 32 nonlarge Chinook, 3 coho, 24 chum, 45 pink, and 7,681 sockeye salmon, including a Tahltan Lake sockeye salmon harvest of 3,396 fish. The Tahltan Lake sockeye salmon harvest was below the weekly guideline harvest of 5,948 sockeye salmon. The total weekly sockeye salmon harvest was comprised of $44 \%$ Tahltan, $42 \%$ Tuya, and $14 \%$ mainstem sockeye salmon. The Tahltan Lake sockeye salmon C/B/D was well above average, whereas the mainstem sockeye salmon C/B/D of 20 fish was well below the average of 49 fish for this week, indicating that the mainstem sockeye salmon return may be late entering the fishery, or indicating an exceptional weak return. The fishery was prosecuted under very good fishing conditions. The upper Stikine AF sockeye and Chinook salmon catches were well above average. This week's Tahltan Lake weir count of 6,100 sockeye salmon was well below average for this week. The Little Tahltan cumulative weir count of 196 fish continued to lag well behind the seasonal average of approximately 1,296 large Chinook salmon.

In SW 31 the fishery regime switched from a focus on Tahltan Lake sockeye salmon abundance to the abundance of mainstem sockeye salmon. The fishery was posted for an initial 48 hr opening with a guideline harvest of 11,736 sockeye salmon including 2,171 mainstem sockeye salmon. The run size projection increased to 190,500 sockeye salmon
based on an average of the inriver commercial CPUE regression and the SMM. The mainstem projection of 49,800 fish was slightly below the preseason expectation. The increase in overall run size was driven primarily by the above average abundance of Tahltan Lake sockeye salmon in SW 30. The day one harvest of 1,114 mainstem sockeye salmon and C/B/D of only $55 \mathrm{C} / \mathrm{B} / \mathrm{D}$ of mainstem sockeye salmon resulted in a decision to hold the fishery to 48 hrs. This week's 48 hr fishery yielded a harvest of 13 large Chinook, 0 nonlarge Chinook, 23 coho, 52 pink, 21 chum, and 6,885 sockeye salmon, including 1,992 mainstem fish, close to the guideline harvest of 2,107 fish. The total weekly sockeye salmon harvest was comprised of $56 \%$ Tahltan, $15 \%$ Tuya, and $29 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D of 55 fish was well below the average 62 C/B/D. The upper Stikine AF sockeye salmon effort dropped substantially. The Tahltan Lake cumulative weir count was 10,665 sockeye salmon compared to an average of 21,000 fish. The cumulative count of large Chinook salmon through the Little Tahltan weir remained low at only 320 fish compared to an average of 1,824 large Chinook salmon.

In SW 32 the fishery was posted for an initial 24 hr period with a guideline harvest of 941 mainstem sockeye salmon. The TAC was based on an overall run size projection of 209,483 sockeye salmon including 52,552 mainstem sockeye salmon generated from averaging the SMM and inriver regression model. The sockeye salmon harvest after 20 hrs fish was 1,992 fish; the projected 24 hr catch was 2,400 sockeye salmon including approximately 1,398 mainstem sockeye salmon. Given a guideline catch of 941 mainstem sockeye salmon for this week, the fishery was held at 24 hrs . This week's 24 hr fishery prosecuted under good fishing conditions yielded a harvest of 5 large Chinook, 4 nonlarge Chinook, 43 coho, 12 chum, 48 pink, and 2,586 sockeye salmon, including a mainstem sockeye salmon harvest of 1,358 fish. The harvest of mainstem sockeye salmon was slightly above this week's guideline harvest. The mainstem sockeye salmon C/B/D was 75 fish vs. the average of 58 fish. The total weekly sockeye salmon harvest was comprised of $33 \%$ Tahltan, $15 \%$ Tuya, and $53 \%$ mainstem sockeye salmon. The Tahltan Lake cumulative weir count of sockeye salmon to date of 20,986 fish was slightly above the seasonal average. The cumulative count of large Chinook salmon through the Little Tahltan weir remained low at only 440 fish compared to an average of 2,125 large Chinook salmon. Effort in the upper Stikine AF fishery was weak with only one or two nets fishing during the course of the week.

In SW 33 the fishery was posted for an initial 24 hr period with a guideline harvest of 17,267 sockeye salmon including a harvest goal of 2,217 mainstem sockeye salmon. The TAC was based on a run size projection of 55,288 mainstem sockeye salmon generated from inriver regression models and the SMM. The catch of 961 mainstem sockeye salmon after 20 hrs of fishing, and a projected 24 hr catch of 1,158 mainstem sockeye prompted a 24 hr extension. This week's 48 hr fishery yielded a harvest of 1 large Chinook, 0 nonlarge Chinook, 165 coho, 30 chum, 50 pink, and 4,027 sockeye salmon, including a mainstem sockeye salmon harvest of 2,077 fish. The total weekly sockeye salmon harvest was comprised of $41 \%$ Tahltan, $7 \%$ Tuya, and $52 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D was 61 fish vs. the average of 40 fish. Fishing conditions were good in day one, but deteriorated in day two. Effort in the upper Stikine AF was weak. The Tahltan weir count to date was 39,307 sockeye salmon, well above average. The Little

Tahltan weir project ended on 12 August. The final count was 450 large fish and 490 nonlarge Chinook salmon. The near record low count was well below the escapement goal of 3,300 large Chinook salmon; indeed, it was below the lower end of the escapement goal range of 2,700 to 5,300 large Chinook salmon. The count of nonlarge Chinook salmon was the second highest on record.

In SW 34 the fishery was posted for an initial 24 hr period. The run projection, based on averaging the SMM and the inriver CPUE model, dropped to 181,763 sockeye salmon including a run size of to 54,493 mainstem sockeye salmon. There was no surplus mainstem sockeye TAC this week, but it was anticipated that the run size estimate would increase based on the C/B/D observed over the past two weeks, and the anticipation of the run continuing to building. The catch of 930 mainstem sockeye salmon after 20 hrs of fishing, and a projected 24 hr catch of 1,121 mainstem sockeye salmon was used to generate a new overall population estimate of 198,506 sockeye salmon including 66,276 mainstem sockeye salmon. The resulting TAC of mainstem sockeye salmon increased to 3,836 fish, which prompted a 24 hr extension. The 48 hr fishery, prosecuted under near perfect fishing conditions, yielded a harvest of 1 large Chinook, 1 nonlarge Chinook, 460 coho, 26 chum, 31 pink, and 2,642 sockeye salmon, including a mainstem sockeye salmon harvest of 2,245 fish. The total weekly sockeye salmon harvest was comprised of $9 \%$ Tahltan, $6 \%$ Tuya, and $85 \%$ mainstem sockeye salmon. The mainstem sockeye salmon C/B/D was an incredible 114 fish, while the average was 14 fish. Eight licences did not fish this week, which most likely inflated the C/B/D metric. Only one net fished the upper Stikine AF this week. The Tahltan Lake weir count as of this week was 29,521 sockeye salmon, above the escapement goal range of 18,000 to 30,000 sockeye salmon. Fish were still building at the weir at week's end. The return of sockeye salmon to Tahltan Lake was obviously late and protracted.

In SW 35 the fishery was opened for an initial 48 hr period with the management objective focused on coho salmon abundance. A total of 18 licensed fishers were active (i.e. 8 commercial fishers returned to harvest coho salmon). The guideline harvest on coho salmon was 5,000 fish for the season including a 1,000 fish guideline harvest for this week. The CPUE in both the commercial and assessment/test fisheries leading up to this opening indicated a relatively weak return of coho salmon. After 24 hrs of fishing and a harvest of 378 coho salmon the fishery was extended for 24 hrs . This week's 72 hr fishery yielded a harvest of 1,215 coho, 43 chum, 5 pink, and 2,961 sockeye salmon, $91 \%$ if which were mainstem sockeye salmon. The fishing conditions were relatively poor; the coho salmon CPUE was below average.

In SW 36 the fishery was opened for an initial 72 hr period with a guideline harvest of 2,000 fish. A total of 18 licensed fishers were active in this week's fishery. After 48 hrs of fishing and a harvest of 691 coho salmon that indicated there was room to consider more fishing time, the fishery was extended for 24 hrs . This week's 96 hr fishery yielded a harvest of 1,647 coho, and 1,500 sockeye salmon, $96 \%$ of which were mainstem sockeye salmon. The fishing conditions were very good at the outset of the fishery, but worsened as the fishery progressed; the coho salmon C/B/D was below average.

In SW 37 the fishery was opened for an initial 72 hr period. Only 7 licensed fishers were active this week. The guideline catch was 2,081 coho salmon. The catch of only 782 coho salmon in day one prompted a 24 hr extension; the catch of 1,280 coho salmon after 72 hrs prompted a second 24 hr extension. This week's 120 hr fishery yielded a catch of 2,081 coho salmon and 677 sockeye salmon. The final day of the 2015 fishing season was 10 September. The final coho salmon harvest was 5,639 fish, 696 of which were taken in the course of the sockeye salmon fishery and, therefore, not counted toward the 5,000 fish allocation as prescribed in the PST.

## Upper Stikine River Commercial Fishery

A small commercial fishery has existed near Telegraph Creek on the upper Stikine River since 1975. A total of 202 sockeye and 1 large Chinook salmon were caught in 2015, which was well below the average. The fishing effort of 9 boat days fished was below average. Generally, fishery openings were based on the lower Stikine commercial fishery openings, lagged one week. The first opening, however, was concurrent with the lower Stikine commercial fishery opening.

## Aboriginal Fishery

The upper Stikine AF fishery, which is located near Telegraph Creek, B.C., harvested 1,022 large Chinook, 198 nonlarge Chinook and 8,184 sockeye salmon in 2015. The harvest of all species was well above average. The harvest of sockeye salmon was the second highest on record, assumed to be driven by the above average run size, good fishing conditions, and increased effort.

## Recreational Fishery

The Stikine River salmon recreational fishery targets primarily Chinook salmon and its principal fishing location is located at the mouth of the Tahltan River. Minor sport fishing activities occur in upper reaches of the Tahltan River and in some tributaries of the Iskut River, including Verrett and Craig rivers. In 2015 the harvest estimate was 75 large Chinook and 25 nonlarge Chinook salmon. All of the fish were taken in the Telegraph Creek area. Access to the fishing sites near the mouth of the Tahltan River was restricted by the Tahltan First Nation Chief and Council in order to limit recreational harvest on Little Tahltan bound Chinook salmon.

## Escapement

## Sockeye Salmon

A total of 33,159 sockeye salmon were counted through the Tahltan Lake weir in 2015, $16 \%$ above the average of 28,667 fish and above the escapement goal range of 18,000 to 30,000 fish. An estimated 14,312 fish ( $49 \%$ of spawners) originated from the fry-stocking program, which was similar to the $49 \%$ contribution observed in smolts leaving the lake in 2012, the principal smolt year contributing to the 2015 return. A total of 3,871 sockeye salmon were collected for brood stock and no fish were collected for stock identification
purposes, resulting in a spawning escapement of 29,288 sockeye salmon in Tahltan Lake. Although remedial work was done at the Tahltan River landslide in March 2015, the site appears to remain a challenge for both Chinook and sockeye salmon during their migrating to their respective spawning grounds located above the landslide. The amount of enroute mortality caused by the landslide will be reviewed over the winter and spring of 2016.

The spawning escapement for the mainstem and Tuya excess stock groups are calculated using stock identification, test fishery and inriver commercial harvest data. Based on this run reconstruction approach, the mainstem sockeye salmon escapement estimate was 26,432 fish, within the escapement goal range of 20,000 to 40,000 fish. The Tuya excess estimate was 20,832 sockeye salmon, which was well above average. Aerial survey counts of mainstem sockeye salmon were of little utility in 2015 due to the overall poor viewing conditions.

## Chinook Salmon

A MR study was conducted again in 2015 concurrent with the SCMM to assess the inriver Chinook salmon abundance. Inseason MR estimates were calculated weekly, SW 26-29. The final postseason Stikine River spawning escapement, based on tag recoveries from the commercial fishery, and spawning ground recoveries, was 21,597 large Chinook salmon, $6 \%$ above the average escapement of 20,300 , and within the escapement goal range of 14,000 to 28,000 large Chinook salmon.

The 2015 Chinook salmon escapement enumerated at the Little Tahltan River weir was 450 large fish and 490 nonlarge Chinook salmon. The escapement of large Chinook salmon in the Little Tahltan River was well below the average count of 2,129 fish and well below the Canadian target escapement of 3,300 fish making the ninth consecutive year that the lower end of the Canadian escapement goal was not reached.

Stikine River Chinook salmon run timing to the Lower Stikine commercial fishing grounds appeared to be approximately one week late. Passage above Little Tahltan River weir was also later than average. Verrett Creek escapements counts could not be estimated due to high turbid water. The carcass pitch crew stationed at the creek from 4-10 August sampled a below average number of Chinook salmon; the crew characterized the run as "low in numbers", but the project was subject to sampling during periods of above average stream flows. An average run of Shakes Creek Chinook salmon was reported by residents living at the creek mouth.

## Coho Salmon

The annual coho salmon aerial survey was conducted on 07 November under excellent viewing conditions. The total count of coho salmon observed at six index sites was 1,181 fish; $44 \%$ below average. Given the below average harvests observed in the U.S. gillnet fishery, the lower Stikine commercial fishery, and the incidental coho salmon harvest taken in the lower Stikine sockeye salmon test fishery, it was expected that the survey counts would also yield a below average count.

A coho salmon drift gillnet test fishery was not conducted in 2015 due to budgetary constraints.

## Sockeye Salmon Run Reconstruction

The postseason estimate of the terminal Stikine River sockeye salmon run was 174,292 fish. Of this number, approximately 74,151 fish were of Tahltan Lake origin (wild \& enhanced), 48,929 fish were of Tuya origin (fry from Tahltan brood stock stocked into Tuya Lake), and 51,212 fish were mainstem (Table 3). These estimates are based on postseason data, including otolith recovery and GSI analysis in the U.S. Districts 106 and 108 harvests. For inriver estimates they are based on inseason and postseason otolith analysis: egg diameter stock-composition estimates for inriver harvest from the Canadian commercial, Aboriginal, ESSR, and test fishery harvests, and escapement data. The 2015 terminal run was average and above the preseason forecast of 171,200 fish.

## TAKU RIVER

Taku River salmon are harvested in the U.S. gillnet fishery in Alaskan District 111, in the northern Southeast Alaska seine and troll fisheries, in the Juneau area sport fishery, and in the inriver personal use fishery. Canadian fisheries for Taku River salmon include a commercial gillnet fishery located in the river near the Canada/U.S. border, an AF, and a sport fishery (Figure 2).

Figure 2. The Taku River and principal U.S. and Canadian fishing areas.

## Harvest Regulations

Fishing arrangements in place as a result of Annex IV, Chapter 1 of the PST can be found at: http://www.psc.org/publications/pacific-salmon-treaty/ . For salmon originating in the Canadian portion of the Taku River watershed, these arrangements include the continuation of directed fisheries for Taku River Chinook salmon stocks, first implemented in 2005; continuation of coho salmon harvest shares; and, a sockeye salmon harvest sharing arrangement based on the production of enhanced fish.

## U.S. Fisheries

The traditional District 111 commercial drift gillnet salmon fishery was open for a total of 44 days from June 21 through September 28, 2015. The harvest totaled 1,083 Chinook, 55,096 sockeye, 23,169 coho, 288,625 pink, and 475,181 chum salmon. Harvest of pink salmon was above average, while harvests of all other salmon species were below average. The traditional fishery does not include harvests from the Speel Arm SHA inside Port Snettisham.

The 2015 season was the sixteenth year of adult sockeye salmon returns to the Snettisham Hatchery inside Port Snettisham. These fish contributed to the traditional harvests in Taku Inlet and Stephens Passage, and made up nearly the entire common property harvest in the Speel Arm SHA inside Port Snettisham, which was initially opened to fishing during SW 34 to target Snettisham Hatchery sockeye salmon. This was the first year of full production for DIPAC's revitalized enhanced coho salmon program, and these fish contributed to the traditional harvests in Taku Inlet. Hatchery stocks contributed substantially to the total harvest of sockeye, chum and coho salmon and more minimally to the harvest of Chinook salmon.

A bilateral review of the escapement goal for Taku River large Chinook salmon completed in early 2009 resulted in a revised escapement goal range of 19,000 to 36,000 fish. The adjusted 2015 preseason terminal run forecast of 26,100 Taku River large Chinook salmon provided no AC for directed fisheries for either country. An inriver assessment/test fishery was conducted by Canada with a target of 1,400 large fish apportioned out over seven weeks according to average run timing. Tagging for the inriver MR project was again increased with additional effort using drifted tangle nets on both sides of the border and a pilot purse seine feasibility study in Taku Inlet, as well as the traditional Canyon Island fish wheels. A total of 2,269 tagged fish were put out by these efforts. The first inseason terminal run estimate, however, was delayed until SW 24 due to consistently high Taku River water levels complicating the analyses. The second inseason terminal run estimate of Taku River large Chinook salmon (over 30,000 large fish) allowed an initial District 111 gillnet sockeye salmon opening in SW 26 with no time, mesh or area restrictions for Chinook salmon conservation for the first time since 2010. The 2015 District 111 drift gillnet Chinook salmon harvest in SWs 26-28 was 885 fish of which $56 \%$ were large fish. Postseason GSI analysis indicates Alaskan hatchery Chinook salmon contributed $40 \%$ of the large fish harvest, and $59 \%$, or 292 fish, were of wild Taku River origin through SW 28. The Juneau area sport harvest of Taku River large Chinook salmon was estimated at

463 fish during the same time period based on GSI analysis. The spawning grounds MR estimate of Taku River spawning escapement was 28,827 large Chinook salmon.

The traditional District 111 sockeye salmon harvest of 55,096 fish was well below average and the lowest since 1988. Weekly sockeye salmon CPUE was below average through SW 33. Once management focus of the traditional fishery shifted to Taku River coho salmon abundance, the opening of the entrance to Port Snettisham in SW 34 resulted in above average sockeye salmon CPUE through SW 36 of predominantly Snettisham Hatchery sockeye salmon. Snettisham Hatchery sockeye salmon stocks began to contribute to the traditional fishery in SW 27 and otolith sampling occurred through SW 33. Of the total traditional District 111 sockeye salmon harvest, $86 \%$ occurred in and around Taku Inlet (average is 64\%), 7\% occurred in Stephens Passage south of Circle Point (average is 29\%) and $7 \%$ occurred in Port Snettisham (average is $11 \%$ ). The contributions of wild Taku River, enhanced Taku River, enhanced Port Snettisham, and other sockeye salmon stocks were derived from estimates based inseason on otolith analysis and postseason from estimates based on GSI and otolith analyses. The postseason estimated stock composition of the harvest of sockeye salmon in the traditional fishery was 40,904 (80\%) wild Taku River, 194 (0.004\%) enhanced Tatsamenie, and 6,698 (13\%) Snettisham Hatchery fish.

Table 4. Taku sockeye salmon run reconstruction, 2015. Estimates do not include spawning escapements below the U.S./Canada border.

Opportunity to harvest Snettisham Hatchery sockeye salmon inside Port Snettisham began in SW 33 with a one day opening in the entrance due to significant fish movement through the Speel Lake weir and a small fleet in the area. In SW 34, with building escapement through the weir, a portion of the Speel Arm SHA and later the entire SHA was opened
which resulted in more than $80 \%$ of the total District 111 effort fishing in the Speel Arm SHA in SW 34. The Speel Arm SHA was opened through SW 39 but did not receive any effort after SW 36.

Coho salmon stocks harvested in District 111 include returns to the Taku River, Port Snettisham, Stephens Passage, and local Juneau area streams, as well as Alaskan hatchery release sites. In early 2015 an escapement goal range of 50,000 to 90,000 Taku River coho salmon with a 70,000 fish point goal was adopted. The U.S. management intent is to pass 75,000 coho salmon above border to provide for escapement and a 5,000 fish assessment fishery, and Canada may harvest any fish surplus to the 70,000 fish escapement goal. The 2015 preseason terminal run forecast of 158,500 fish translated to a 99,000 fish inriver run estimate. The traditional District 111 coho salmon harvest of 23,169 fish was $59 \%$ of the 39,486 fish average. DIPAC enhanced coho salmon first appeared in the District 111 harvest in SW 35 and in SW 39 and SW 40 comprised $76 \%$ and $73 \%$ of the harvest respectively. CWT analyses indicate DIPAC enhanced coho salmon contributed 4,791 fish or $21 \%$ of the 2015 District 111 drift gillnet harvest.

Management of the District 111 drift gillnet fishery is based on wild Taku River sockeye salmon abundance in SWs 25-33 and on wild Taku River coho salmon abundance in SWs 34-42. The 2015 fishery began by regulation in SW 26. Management actions were limited to imposing restrictions in time, area, and gear. Because there is no bilaterally agreed forecast for Taku River sockeye salmon, early season management of the District 111 fishery is based on fishery CPUE and Canyon Island fish wheel catches. As the fishing season progresses, sufficient data is acquired to estimate the inriver run size from the inriver MR program using the Canyon Island fish wheels as event 1 and the Canadian inriver fishery as event 2 , and to use that estimate in conjunction with historical migratory timing and fishery harvest data to project the season's Taku River sockeye salmon run size. In the first week of sockeye salmon management starting June 21, Section 111-B was open for three days with an above average Taku River sockeye salmon run forecast by Canada and no gear or area restrictions for Chinook salmon conservation. Effort was the highest above average for the season this week with 72 boats ( $148 \%$ of average) fishing. The sockeye salmon harvest was $56 \%$, and the CPUE was $40 \%$ of average. The total Chinook salmon harvest was 541 fish with approximately 188 fish estimated as Taku River origin large fish based on inseason CWT analyses.

In SW 27, Section 111-B was opened for two days due to the SW 26 low above border run projection of 20,500 Taku River sockeye salmon. Although this estimate was based on little data and fish wheel catches were decent for the time, the SW 26 sockeye salmon CPUE in the D111 fishery was very poor and effort was well above average. Seventy-three boats harvested 217 Chinook salmon of which 133 were estimated to be Taku River large fish based on inseason CWT analysis. The sockeye salmon harvest was $37 \%$ and CPUE was $59 \%$ of average. The inseason above border run projection generated midweek in SW 27 to inform the decision for the SW 28 opening was 39,200 Taku River sockeye salmon substantially below the escapement goal.

Fishing time for SW 28 was again set for two days in Section 111-B. Although some of the weak inriver indicators could be attributed to technical issues with one of the Canyon Island fish wheels and a Tulsequah flood starting on July 1, the D111 gillnet sockeye salmon harvests continued to be weak and low sockeye salmon bycatch in the inriver Chinook salmon MR drift nets was also occurring. A six-inch minimum mesh size restriction was implemented in Stephens Passage south of Circle Point to conserve wild Port Snettisham sockeye salmon stocks transiting the area while allowing opportunity to harvest enhanced DIPAC chum salmon returning to the area and this restriction remained in place through SW 32. Effort fell from the previous week to 61 boats which harvested 127 Chinook salmon, 71 of which were Taku River large fish based on inseason CWT analysis. The total District 111 gillnet harvest of Taku River large Chinook salmon for the Chinook salmon accounting period SWs 18-28, is 292 fish based on postseason GSI analysis. Sockeye salmon harvest and CPUE were respectively $35 \%$ and $88 \%$ of average. The midweek inseason projection available when the decision for the SW 29 fishery was made was for an above border run of 73,500 sockeye salmon, projecting a total escapement of 64,300 fish, below the minimum of the escapement goal range, with historically one-third of the run passed above border.

Table 5. U.S. inseason forecasts of D111 terminal run size, total allowable catch, inriver run size, and the U.S. harvest of wild Taku River sockeye salmon for 2015.

|  | Inriver <br> Run | Terminal <br> Run | Total <br> TAC | US <br> TAC | Projected ${ }^{\text {a }}$ <br> US harvest |

| ${ }^{\text {SForecast based on estimate including entire weeks data. }}$ |  |  |  |  |  |

With the first three inseason estimates of sockeye salmon abundance available when the following weeks fishery decisions were made projecting insufficient numbers of fish to achieve the escapement goal for the Taku River, let alone providing TAC for directed fisheries, fishing time for SW 29 was set for one day in Taku Inlet north of Circle Point, with an additional area restriction closing Taku Inlet north of Greely Point, and two days in Stephens Passage south of Circle Point. The intention of this new management approach was to conserve Taku River sockeye salmon yet still provide some opportunity on other stocks in the area, primarily enhanced DIPAC chum salmon. This was the first 24-hour opening of Taku Inlet during sockeye management since 1988, but this time with the
majority of Taku Inlet closed. Section 111-C was open concurrently with the area south of Circle Point to target pink salmon based on aerial survey indications of strong abundance. Effort for the week was the highest of the season, but only $83 \%$ of average for the week, with 93 boats predominantly targeting enhanced chum salmon during the peak of those returns. Sockeye salmon harvest and CPUE were $11 \%$ and $17 \%$ of their respective averages. Otolith analysis revealed that $8 \%$ of the sockeye salmon harvest from Taku Inlet, and $13 \%$ from Stephens Passage, were of Snettisham Hatchery origin. The enhanced Tatsamenie sockeye salmon contribution to the Taku Inlet harvest was the highest of the season at $0.6 \%$ of the harvest. The sockeye salmon above border run projection generated midweek after the weekly fishery closed increased significantly to 124,200 fish with projected escapement at 114,800 fish.

Fishing time for SW 30 was set for two days in Section 111-B and 111-C. Both sections were extended for an additional day, for a total of three days of fishing based on good fish wheel sockeye salmon catches and average to above average CPUE from the first day of the D111 gillnet fishery. Effort stayed similar to the previous week with 91 boats making landings. The sockeye salmon harvest for the entire opening was $49 \%$ of average while CPUE was $58 \%$ of average. Otolith analysis revealed that $10 \%$ of the sockeye salmon harvest from Taku Inlet, and 24\% from Stephens Passage, were of Snettisham Hatchery origin. TBR enhanced sockeye salmon of Tatsamenie Lake origin contributed less than 1\% in both Taku Inlet and Stephens Passage. The weekly Taku River sockeye salmon total escapement projection dipped slightly to 110,400 sockeye salmon.

Fishing time for SW 31 was set for three days in Section 111-B and 111-C. Both sections were extended for an additional two days, for a total of five days of fishing, due to increasing Taku River sockeye salmon run size estimates, the small fleet fishing in D111, and challenging marine weather conditions in the first couple days of the opening. Effort dropped from the previous week to 67 boats, $65 \%$ of average for the week. Stephens Passage effort levels remained well below average all season, mostly due to the below average sized chum salmon prevalent in 2015 and the six-inch minimum mesh size restriction in place to conserve wild Port Snettisham sockeye salmon. The sockeye salmon harvest improved to $93 \%$ of average while CPUE was $90 \%$ of average with the total weekly sockeye salmon harvest in the traditional fishery the highest of the season. Otolith analysis revealed that $6 \%$ of the sockeye salmon harvested in Taku Inlet and $67 \%$ of the harvest in Stephens Passage were of Snettisham Hatchery origin. TBR enhanced Tatsamenie Lake origin sockeye salmon contributed $0.5 \%$ and $3 \%$ to Taku Inlet and Stephens Passage harvests respectively. This was the highest weekly contribution of enhanced Tatsamenie fish in Stephens Passage; however the sample size was quite small. The weekly Taku River sockeye salmon run size estimate placed the current escapement past all fisheries at 81,400 fish, which is above the upper end of the goal range, and projected a final escapement for the season of 115,500 fish.

Fishing time for SW 32 was set for four days in Section 111-B and 111-C with the six-inch mesh size restriction in place in Stephens Passage south of Circle Point. Effort declined from the previous week to 51 boats, and sockeye salmon harvest and CPUE were $66 \%$ and $93 \%$ of their respective averages. Effort also declined precipitously throughout the opening
mirroring chum salmon catch rates. Otolith analysis indicated that $19 \%$ of the sockeye salmon harvest from Taku Inlet and 80\% from Stephens Passage were of Snettisham Hatchery origin, and TBR enhanced Tatsamenie Lake origin sockeye salmon contributed less than $1 \%$ of the Taku Inlet and Stephens Passage harvest. The weekly Taku River sockeye salmon run estimate fell slightly from the previous week to an above border projection of 114,500 fish and a total escapement projection of 101,100 fish.

Fishing time for SW 33 was set for three days in Section 111-B and 111-C and the six-inch minimum mesh size restriction south of Circle Point was removed for the season. The opening was extended one day, for a total of four days of fishing, due to a small fleet, Taku River sockeye salmon run estimates projecting escapement above the upper end of the goal range, and encouraging movement of sockeye salmon through the Speel Lake weir. Effort declined again from the previous week to 49 boats and most of the effort at the end of the opening was concentrated in the entrance to Port Snettisham, which was opened for the first time of the season during the one-day extension. Sockeye salmon harvest and CPUE for the last official week of sockeye salmon management were $60 \%$ and $75 \%$ of their respective averages. Otolith analysis indicated that $20 \%$ of the sockeye salmon harvest from Taku Inlet and 53\% from Stephens Passage were of Snettisham Hatchery origin. TBR enhanced Tatsamenie Lake origin fish accounted for less than $1 \%$ of the Taku Inlet and Stephens Passage harvests. This was the final week of otolith sampling from the D111 gillnet fishery. The weekly Taku River sockeye salmon terminal run size estimate increased from the previous week and projecting total escapement at 107,262 fish.

The fall drift gillnet season in District 111 occurred over seven weeks, beginning on August 16 in SW 34, and ending on September 28 in SW 40. During this time, management in Section 111-B switches from sockeye to coho salmon abundance.

Fishing time for SW 34 was set for three days in Section 111-B and 111-C, with the opening delayed until Monday to accommodate the Golden North Salmon Derby taking place in Juneau area waters. Both sections were extended one day, for a total of four days of fishing due to a well below average fleet size predominantly focused on returns of enhanced sockeye salmon to the Snettisham Hatchery. There were two area extensions into the Speel Arm SHA during the week with the entire SHA opening for the final 24 hours of the fishery when it became evident that escapement of wild Speel Lake sockeye salmon would achieve the lower end of the goal range. A total of 42 boats made landings throughout the week with 16 of these fishing outside the Speel Arm SHA, and only nine boats fishing in Taku Inlet. The sockeye salmon harvest for the traditional fishery was $61 \%$ of average, while CPUE was $155 \%$ of average. The first Taku River coho salmon inriver run estimate was produced this week and expanded by average run timing projected an above border run of 78,500 fish, below the preseason forecast. The above average weekly coho salmon harvests and catch rates in the early part of the season appeared to have little correlation with the fall run.

Fishing time in Section 111-B and 111-C during SW 35 was set for three days in anticipation of a small fleet mostly targeting enhanced sockeye salmon inside Port Snettisham and the Speel Arm SHA. The waters inside Port Snettisham were extended two
additional days to provide more opportunity for harvest of enhanced sockeye salmon. A total of 37 boats made landings throughout the week with 18 boats participating in the traditional fishery outside of the Speel Arm SHA. Coho salmon harvest and CPUE in the traditional fishery were $27 \%$ and $74 \%$ of average, respectively. The projected inriver run estimate for Taku River coho salmon increased from the previous week to 83,600 fish.

Section 111-B was opened for four days in SW 36 with indications of building Taku River coho salmon abundance and a traditional fishery fleet size in the previous week that was $41 \%$ of average. Section 111-C was closed for the remainder of the season as the pink salmon return to the area appeared complete. The Speel Arm SHA was opened until further notice to provide opportunity for enhanced sockeye salmon arriving late and only a handful of boats made landings there. A total of 31 boats, $70 \%$ of average, made landings in the traditional fishery with coho salmon harvest and CPUE at $56 \%$ and $69 \%$ of average, respectively. CWT analysis indicated that $13 \%$ of the traditional coho salmon harvest was comprised of Alaska hatchery fish. The inseason Taku River coho salmon estimate projected an inriver run of 75,000 fish, dropping by more than 5,000 fish from the previous week.

Fishing time in SW 37 was set for three days in Section 111-B due to below average effort in previous weeks and indications of strong Alaska hatchery coho salmon abundance. The Speel Arm SHA remained open until further notice and received no effort throughout the week. This week was the first opening of the season where effort predominantly targeted coho salmon and the 34 boats fishing was just below average. The coho salmon harvest was $64 \%$ of average while CPUE was $92 \%$ of average. CWT analysis indicated that $42 \%$ of the coho salmon harvest was comprised of Alaska hatchery fish. The weekly Taku River coho salmon inriver run projection fell to 68,800 fish.

Fishing time in SW 38 was set for two days in Section 111-B. This was approximately half of the historical average open time for the week, and was a result of the inriver coho salmon projection falling below the 75,000 fish U.S. above border management target. The increasing enhanced fish contribution to the gill net fishery and increased commercial troll CPUE in waters leading to District 111 supported this minimal opening in spite of the weak above border run size projection. The Speel Arm SHA was open concurrently with Section 111-B and again attracted no effort. Effort in the traditional fishery fell from the previous week to 21 boats with the coho salmon harvest $29 \%$ of average while CPUE was $82 \%$ of average. CWT analysis indicated that Alaska hatchery fish contributed $12 \%$ to the weekly coho salmon harvest. A weekly Taku River coho salmon inriver run size estimate was not available at the time the decision had to be made for the SW 39 fishery.

Fishing time in Section 111-B was again set for two days in SW 39. This opening was based on an anticipated drop in effort, positive indicators from the troll fishery outside of D111, continued presence of enhanced DIPAC coho salmon in the harvest and increased wild Taku River coho salmon CWT recoveries in the D111 gillnet fishery. Effort fell from the previous week to 17 boats. The Speel Arm SHA was opened for the last time this season and had no effort. Coho salmon harvest and CPUE were 136\% and 213\% of their respective averages. CWT analysis indicated that Alaska hatchery fish contributed $76 \%$ to the weekly
coho salmon harvest. The Taku River coho salmon inriver run projection based on SW 38 data generated early in SW 39 fell to 56,300 fish but once data obtained in SW 39 was incorporated, the inriver projection increased to 62,200 fish, the first increase in the run size projection in several weeks.

Based on the strong presence of enhanced DIPAC coho salmon in the SW 39 harvest, fishing time in Section 111-B was set for one day in SW 40. In addition, the area restriction in Taku Inlet closing the waters north of the latitude of Greely Point was utilized - the same closure used in SW 28 during sockeye salmon management to minimize harvest on Taku River stocks while allowing some opportunity on other stocks in the area. Effort again fell from the previous week to six boats with coho salmon harvest and CPUE at 76\% and 325\% of their respective averages. The Alaska hatchery contribution was estimated by CWT analysis to be $73 \%$ of the coho salmon harvest. The Taku River coho salmon inriver run projection fell from the previous week to 60,700 fish. With another decreasing Taku coho run size projection, the D111 gillnet fishery was closed for the season.

The District 111 fall chum salmon harvest in SWs $34-40$ was $12 \%$ of average. Escapement numbers for Taku River chum salmon are unknown; however, the number of fall chum salmon caught by the fish wheels at Canyon Island was used as an index of escapement. The 2015 fish wheel catch of 95 chum salmon was $34 \%$ of average.

The District 111 traditional drift gillnet pink salmon harvest of 288,600 fish was $202 \%$ of average. The escapement number to the Taku River is unknown; however the number of pink salmon caught by the fish wheels at Canyon Island was used as an index of escapement. The total of 24,244 pink salmon caught in the fish wheels was more than five times the 2013 parent-year and $211 \%$ of the 1995 to 2013 odd-year average.

Several other fisheries in the Juneau area harvested transboundary Taku River salmon stocks in 2015. A number of Chinook salmon stocks are known to contribute to the Juneau area sport fishery, including wild fish from the Chilkat River, as well as hatchery stocks, but the major contributor of large, wild fish is from the Taku River. Of the Chinook salmon harvested, 463 fish were estimated to be of Taku River origin through SW 28 based on postseason GSI analysis. Personal use permits were used to harvest an estimated 900 Taku River sockeye salmon along with an estimated incidental harvest of 29 Taku River large Chinook salmon. Common property purse seine fisheries were conducted in the Amalga Harbor SHA in District 111, northwest of Juneau for the fourth consecutive season, to target returning DIPAC enhanced summer chum salmon. There were four total openings in 2015, occurring on Thursdays in July, each lasting six hours. Some portion of the incidental sockeye salmon harvest from these fisheries is assumed to be of Taku River origin, but the magnitude of the contribution is unknown. DIPAC conducted GSI analysis of the 2013 and 2014 harvest; samples averaged 35\% Taku River origin. No GSI analysis was conducted in 2015; incidental sockeye salmon (unknown origin) harvest in the Amalga Harbor purse seine fisheries was 912 fish. Otolith analysis did not indicate any TBR enhanced sockeye salmon in the harvest.

## Canadian Fisheries

The Taku River commercial fishery harvest was 868 large Chinook (greater than 660 mm MEF, mostly 3 -ocean or older), 305 nonlarge Chinook, 19,747 sockeye, and 7,886 coho salmon in 2015. Sockeye salmon originating from Taku fry plants contributed an estimated 123 fish to the harvest, comprising $0.7 \%$ of the total commercial sockeye salmon harvest. The harvest of large Chinook salmon was below the average and nonlarge Chinook salmon was below average as well. In 2005, as a result of the new Chinook salmon agreement which allows directed Chinook salmon fishing if abundance warrants, catch accounting for nonlarge salmon was revised from a commercial weight-based designation (previously referred to "jacks" which were typically fish under 2.5 kg or 5 kg , depending on where they were being marketed), to a length-based designation ("nonlarge" Chinook salmon i.e. less than 660 mm in length MEF). Hence, comparisons with catches prior to 2005 should be viewed accordingly. The catch of sockeye salmon was near average and the coho salmon catch was average. There were 43 days of fishing; well below average. The seasonal fishing effort of 302 boat-days was well below average. As is typical, both set and drift gillnets were used, with the majority of the catch taken in drift gillnets. No Chinook salmon were harvested in a directed Chinook salmon fishery but were caught as bycatch in the sockeye and coho salmon fisheries. The maximum allowable mesh size was 20.4 cm ( 8.0 inches) except for the period of June 21 to July 4, at which time it was reduced to 14.0 cm ( 5.5 inches) to minimize the incidental catch of Chinook salmon.

In addition to the commercial fishery catches, 129 Chinook, 85 sockeye, and 299 coho salmon were harvested in the Aboriginal fishery. All but 50 of the Chinook salmon were harvested in the commercial fishing area on the lower river with the remainder from the Nakina River. Based on commercial catch data, it is estimated that 67 of the Chinook salmon caught on the lower river were large and 12 were nonlarge; the Nakina River catch is assumed to have been large fish only. On average, 139 Chinook, 152 sockeye and 147 coho salmon are harvested annually in the Aboriginal fishery.

A test fishery to capture coho salmon for stock assessment purposes took place starting September 13 through October 10 (SWs 38-41). The fishery landed 1,998 coho and 43 sockeye salmon.

Complete recreational harvest figures are not available, but as in recent years it is assumed that about 105 large Chinook salmon were retained in this fishery. The catches of other salmon species are again believed to have been negligible.

The bilateral preseason forecast for the Taku River Chinook salmon terminal run was 26,100 large fish, well below average run size of 34,931 fish. The forecast generated by the Taku River Chinook salmon model produced a terminal run size estimate of 36,900 fish. However, due to consistent overestimation in recent years, this preseason forecast was reduced by $41 \%$ reflecting forecast performance for the past 5 -years. An additional consideration for reducing the model produced forecast was the general poor performance of Chinook salmon stocks in recent years throughout northern British Columbia and Alaska.

At a run size of this magnitude, factoring in the revised interim MSY escapement point target of 25,500 fish, there was no AC for either the U.S. or Canada based on the preseason forecast.

Table 6. Weekly large Chinook salmon guideline harvest for the Canadian assessment fishery in the Taku River for 2015.

| SW | Start Date | Assessment Harvest | Directed Harvest | Preseason <br> Guideline |
| :---: | :---: | :---: | :---: | :---: |
| 19 | 3-May | 147 |  | 150 |

| 25 | 14-Jun | 105 |  | 140 |
| Total |  | 1,357 | 0 | 1,400 |

The inseason management of Taku River Chinook salmon depends on abundance estimates generated from the joint MR program in the lower Taku River with tags being applied below the border and recoveries typically being made in the Canadian assessment/test and/or commercial fisheries. In recent years, when the preseason forecast or inseason projections have indicated no AC, the commercial fishery has operated in an assessment mode and served as the test fishery identified in the PST agreement. In 2015, the assessment fishery was conducted using a target of 1,400 fish as specified in the agreement.

The 2015 management plan indicated that the Chinook salmon assessment (test) fishery was scheduled to open at noon Sunday, May 3. Extensions and subsequent weekly fishing periods would be made until the assessment targets were achieved. Attempts were to be made to spread the weekly harvest over 3 openings, to a maximum of 4 . Mesh sizes would be restricted to between 100 mm ( 4 inches) and 204 mm ( 8 inches) and net length would be up to 36.6 m ( 120 ft .). Use of set nets was prohibited during the assessment fishery and fishers were restricted to a total of one drift net. If reliable inseason run projections were greater than 31,900 large Chinook salmon, a directed Canadian commercial fishery may be considered (provided the weekly guideline exceeded the test fishery target) in accordance with weekly projections of terminal run size and guideline harvests. The Canadian catch would be managed with the objective of meeting escapement and agreed Canada/U.S. and domestic harvest sharing provisions. Additionally, weekly guideline harvests would be reduced by $30 \%$ in response to the low production of Taku River Chinook salmon observed in recent years. In the event that reliable run projections (i.e. estimates made after SW 21) fell below an escapement of 16,150 fish, suspension of the assessment fishery would be considered.

The Chinook salmon assessment fishery opened on May 3 (SW 19) for an initial 12 hour period with a weekly catch guideline of 150 fish. The fishery was extended for an additional two periods of 5 hours each. The fishery ended for the week after the third opening with a
total catch of 147 large Chinook salmon. There were 2 licenses present and the CPUE averaged 80 fish per boat day (fbd) which was well above average ( 27 fbd ) for SW 19. Water levels were below average and remained steady through the fishing period.

The initial opening for SW 20 was set for 12 hours beginning on May 10 and an additional two periods were added (20 and 18 hours respectively). The weekly guideline harvest was 280 large Chinook salmon. Three to four licenses fished and caught a total of 261 fish. The weekly average CPUE was 34 fbd which was near average ( 38 fbd ) despite increasing water levels.

The assessment fishery opened for 20 hours on May 17 to start SW 21. Two additional fishing periods of 20 hours were added plus a final period of 24 hours. The weekly guideline harvest was set at approximately 320 pieces and up to five licenses fished catching a total of 298 large Chinook salmon. The combined weekly CPUE was 22 fish per boat day, below the average of 30 fbd. The water level was high and rose steadily during the fishing period.

For SW 22, the assessment fishery opened for 12 hours on May 24. Two additional fishing periods of 4 and 5 hours were added. The weekly guideline harvest was set at approximately 170 pieces and up to five licenses fished catching a total of 232 large Chinook salmon. The combined weekly CPUE was 61 fish per boat day, well above the average of 37 fbd . The catch rates observed during the third opening were three times the average for that date. The water level peaked and remained steady during the weekly fishing period. To date, a reliable inseason estimate had not been generated.

The initial opening for SW 23 was set at 5 hours with a weekly target of approximately 180 large Chinook salmon. Catch rates were three times the weekly average and five licenses fished catching 151 large Chinook salmon. No further fishing time was allocated for the week. Water levels had begun to drop since the peak in SW 22. A terminal run estimate after the weekly fishing period suggested a run size at or below the escapement target but was considered to be unreliable.

The assessment fishery opened for 4 hours on June 7 to start SW 24. An additional fishing period of 2 hours was added. The weekly guideline harvest was set at approximately 160 pieces and four licenses fished catching a total of 163 large Chinook salmon. The combined weekly CPUE was 163 fish per boat day, four times the average of 40 fbd . The water level was below average for the period fished. After the weekly fishing period, a joint terminal run estimate of 22,731 large Chinook salmon was generated, insufficient to conduct a directed harvest.

The final week (SW 25) of the Chinook salmon assessment fishery opened for 3 hours. An additional fishing period of another 3 hours was added. The weekly guideline harvest was set at approximately 140 pieces and five licenses fished catching a total of 105 large Chinook salmon. The combined weekly CPUE was 84 fish per boat day, three times the average of 28 fbd . Fishing conditions were good as the water levels remained below
average. A joint terminal run estimate of 30,435 large Chinook salmon was made which was a significant improvement over the previous week.

The assessment fishery catches noted in Table 7 total 1,357 large Chinook salmon. The Chinook salmon bycatch in the sockeye salmon fishery was 868 large fish (no directed Chinook salmon harvest for 2015); adding the Aboriginal fishery catch of 117 and an assumed recreational harvest of 105 fish, the actual BLC was 1,090 large Chinook salmon, 27\% below Canada’s BLC. Efforts to minimize commercial bycatch included mesh size restrictions in the first two weeks of the sockeye salmon fishery. Additionally, reduced openings and low effort early in the sockeye salmon season helped to reduce incidental Chinook salmon harvest.

Table 7. Forecasts of terminal run size, allowable catch (AC), weekly guidelines, and actual catch of Taku River large Chinook salmon, 2015.

*: No directed Chinook salmon fishery in 2015.
As per normal procedures, weekly fisheries for sockeye and coho salmon opened at noon Sunday. Fishing periods were set with a view to achieving weekly guideline harvests. Extensions to weekly fishing periods were considered if the weekly guidelines were not achieved. For both drift and set gillnets, net length was restricted to a maximum of 36.6 m (120 ft.); mesh sizes were restricted to between 100 mm (4 inches) and 204 mm (8 inches) except for the period from June 21 (SW 26) through July 04 (SW 27) when the maximum permissible was 14.0 cm ( 5.5 inches) in order to reduce the bycatch of Chinook salmon.

The preseason forecast for wild Taku sockeye salmon was based on stock recruitment and sibling analyses, and projected a run of 216,000 fish, above the average run size of 175,000 fish. Approximately 6,700 enhanced fish from Tatsamenie Lake were forecasted, slightly below the average Tatsamenie enhanced run size of 7,600 fish. Based on the treaty arrangement, an enhanced run of 5,001-15,000 fish provides Canada with a $21 \%$ share of the TAC, with management based on weekly estimates of the TAC of wild fish. Subtracting the escapement target of 75,000 wild sockeye salmon from the forecast of 216,000 resulted in an overall TAC of 141,000 fish; $21 \%$ of that was approximately 30,000 fish.

The forecast for the run of wild Tatsamenie fish was 6,100 fish, below the average of approximately 10,200 fish. The egg-take goal for the 2015 season was based on a target of $30 \%$ of the escapement up to a maximum of 2.0 million eggs. During SWs 31-33 (July 26August 15), management attention focused on Tatsamenie sockeye salmon to ensure an adequate number of sockeye salmon escaped to Tatsamenie Lake to support wild production and egg-take objectives.

As in past years, guideline harvests were developed each week for both sockeye and coho salmon fisheries to guide management decisions so that: a) the catch was consistent with conservation and Treaty goals; and b) management was responsive to changes in projections of abundance, i.e. abundance-based.

The following summarizes the fishery management on a weekly basis and generally captures catch estimates and stock assessment information made inseason. Sockeye salmon catches in relation to run projections are for wild fish; CPUE data is for wild and enhanced fish combined. Guideline harvests presented in Table 8 are based on run projections made the previous week; additionally, those identified in the verbiage were generally based on the previous week's run projection. Weekly enhanced contributions to the overall catch are based on calculations made inseason. Guidelines identified in Table. 8 were set using a 21:79 harvest split up to SW 31 and 20:80 thereafter.

The management plan indicated that the sockeye salmon fishery would be restricted to a 48 hrs period in SW 26 (June 21-27) due to the poor returns observed at Kuthai Lake over the past 10 years. Additionally, modifications could be made based on Chinook salmon escapement concerns. The weekly guideline based on the preseason forecast was 1,840 wild fish (Table 8). Weekly effort included six licenses, below average, and the CPUE of 54 fbd was near the weekly average of 51 . CPUE for Chinook salmon ( 29 fbd ) was well above the weekly average of 12 fbd . Water levels were below average and stable. The fishery was held at two days, resulting in a weekly catch of 653 sockeye salmon and 350 large Chinook salmon. A joint large Chinook salmon estimate generated after the week suggested the terminal run was approximately 27,100 fish.

Statistical week 27 (June 28-July 04) was opened on two days. The weekly guideline harvest for the week, based on the preseason forecast, was 2,052 sockeye salmon. Five licenses fished on day 1; the CPUE of 65 fbd was above the weekly average of 53. As a result, the fishery was extended to three days but the remainder of the week saw catch rates well below average. CPUE for large Chinook salmon was 14 fbd , well above the weekly average of 9 fbd . Water levels remained below average for the fishing period but spiked later in the week due to a Tulsequah flood event. Weekly catch totals were 751 sockeye salmon and 244 large Chinook salmon. The terminal run projection after the final day of fishing was 104,163 fish, well below the preseason forecast.

Table 8. Canadian inseason forecasts of terminal run size, total allowable catch (TAC), and spawning escapement of wild Taku sockeye salmon, 2015.

|  | Terminal |  | Projected | Canadian | Inseason <br> SW | Surplus | Actual <br> Run |

| 33 | 170,193 | 95,193 | 124,547 | 19,039 | 14,938 | 4,504 | 14,386 |

Note: Terminal run assessments and weekly guidelines based on previous week's run size projections. *Surplus AC was calculated using the final estimate for each SW.

Statistical week 28 (July 05-11) was opened again on two days. The weekly guideline was set at 491 sockeye salmon. The allowable maximum mesh size was increased from 14.0 mm ( 5.5 inches) to 204 mm (8 inches) in order to reduce bycatch of pink salmon which were present in the fishery. Day 1 CPUE ( 48 fbd ) was below the weekly average of 55 fbd . Projections made after day 1 suggested that the run remained well below the preseason forecast of 216,000 fish. Additionally, Canyon Island sockeye salmon catches were below average. Based on the poor run outlook, no additional fishing time was added for the week. The weekly catch was 586 sockeye salmon, bringing the cumulative to 1,996 fish, well below the cumulative guideline of 4,383 fish. A total of 157 large Chinook salmon was also caught. Weekly licenses fishing averaged six, and the water remained stable and below average during the fishing period. The weekly sockeye salmon CPUE was 49 fbd, below the average of 55 fbd . The run projection made after the close of the fishery was 89,601 fish, significantly below the SW 27 estimate.

Using the previous week's projection, the weekly guideline for SW 29 (July 12-18) was 349 sockeye salmon. An opening of two days was posted based on the lower than average number of licenses fishing and the catch rates observed the previous week. The opening was characterized by declining and below average water levels. The catch rate for the first day of the fishery was 95 fbd versus an average of 70 fbd for this period. The second day also saw catch rates well above the weekly average but no further fishing time was allocated due to the previous run outlooks. The weekly catch was 1,109 sockeye salmon. Eleven of those were estimated to have been enhanced Tatsamenie fish. The number of licenses fishing for the week held at six. A run projection of 138,002 fish, made after day 2, was above the estimates generated in SWs 27-28.

Statistical week 30 (July 19-25) was opened on three days due to improving run outlooks. The weekly guideline was set at 1,748 sockeye salmon. River levels were slightly above average to start the week but steadily declined through the fishing period. CPUE was below average to start but improved up to day 3, an additional 24 hrs period was added for a total of four days. The weekly CPUE ( 97 fbd ) had improved to near average ( 102 fbd ). The weekly catch was 3,293 sockeye salmon and coho salmon catches ( 405 fish) had also
increased significantly. The cumulative sockeye salmon catch after week 30 was 6,354 wild fish, near the guideline of 6,480 fish. Thirty-three enhanced Tatsamenie fish were also caught. The licenses fished averaged approximately nine. After day 4 of the fishery, a run projection of 194,312 fish was made which was well above the previous week's estimate. Additionally, the projected escapement using the final weekly estimate provided a surplus AC to Canada of approximately 42,000 fish (as per Annex IV, Chapter 1 of the PST).

For SW 31 (July 26-August 01), the weekly guideline was set at 3,702 sockeye salmon based on the much improved run outlook from SW 30. The initial opening was three days with a view that Tatsamenie fish should be near peak timing. A run projection made after day 2 suggested the run size was similar to that of SW 30 and two additional days of fishing were added. The escapement projection was approximately 143,000 sockeye salmon which allowed for a surplus of 3.5 k fish over and above the weekly guideline. The catch rates were well above average for the beginning of the fishing period but finished average (112 fbd) for the week. The weekly catch was 4,781 wild sockeye salmon and only 48 enhanced Tatsamenie fish which was very concerning. Up to nine licenses fished and the river level was stable and below average. The final weekly run projection was 173,442 fish with an escapement estimate of approximately 135,000 wild sockeye salmon.

Statistical week 32 (August 02-08) opened for three days. The weekly guideline was 3,231 fish based on the final run projection in SW 31. After day 1, the run projection had decreased to approximately 170,000 fish and the daily catch rate was well below average. In light of this and the poor showing of enhanced Tatsamenie fish in SW 31, the decision was made not to add any further fishing time. The weekly CPUE was 67 fbd (versus an average of 118 fbd ) for 7-9 licenses; fishing conditions were favourable as water levels were near average. The weekly catch was 1,582 wild and only 16 enhanced Tatsamenie sockeye salmon.

Statistical week 33 (August 09-15) started with a weekly guideline harvest of 1,526 fish. With the drop in the run projection, below average catch rates, and the poor enhanced Tatsamenie catches in the previous two weeks, the fishery was opened on two days only. River levels were near average for the beginning of the week and rose slightly by the end of the fishing period. The fishery was extended for 24 hours due to a day 1 run projection near the previous week, and good catch rates in the fishery ( 88 fbd versus average 67 fbd ) and at the wheels. Weekly licenses fished averaged nine. A total of 1,686 fish were caught, of which 1,669 were wild and 17 were enhanced.

This marked the end of the directed sockeye salmon fishery. The run projection after SW 33 was 170,770 wild fish, below the preseason forecast; the cumulative weekly inseason guideline was 14,938 fish at a $20 \%$ harvest share. The actual harvest of wild fish was 14,386 fish. The escapement projection was 124,504 wild fish, well above the goal range of 71,000 to 80,000 fish.

Adding the wild sockeye salmon taken in the directed coho salmon fishery (5,120 fish) brought the total commercial harvest to 19,506 wild fish. The inseason catch of enhanced
sockeye salmon was 190 which included fish primarily from Tatsamenie Lake and a small number of Stikine origin fish.

Postseason figures for the above are presented in the Sockeye Salmon Run Reconstruction section.

The forecast for the total run of Taku River coho salmon in 2015 was 158,500 fish. This forecast was generated using the relationship between the CPUE in smolt tagging and the total run estimates seen over the past eighteen years. The average total run of Taku River coho salmon is 178,000 fish. Assuming average U.S. exploitation rates, this translated to an inriver run of approximately 99,900 fish. Based on the bilaterally agreed to escapement goal of 70,000 fish (range: 50,000-90,000 fish), the U.S. intent was to manage its fisheries to target a minimum above border run of approximately 75,000 coho salmon. A directed Canadian harvest of 5,000 fish would be permitted starting in week 34 for assessment purposes. Canada was also permitted to harvest all coho salmon in excess of 70,000 plus the fish allocated for assessment purposes. Approximately 2,000 coho salmon would be set aside for a test fishery to be conducted as commercial effort dissipated.

Statistical week 34 (August 16-22) was opened on three days based on the above forecast. The weekly guideline harvest was set at 3,300 coho salmon (projected ~ 30,000 surpluses to escapement target). Catch rates for the week were below average ( 37 fbd versus 62 fbd ) but sockeye salmon catches were well above average for this time of the year. In light of the below average coho salmon catches and Tatsamenie sockeye salmon concerns, the fishery was held at three days. Fishing conditions were favourable and the number of licenses was above average ( $\sim 7$ licenses versus 6 ). A total of 809 coho salmon were landed plus 1,622 sockeye salmon. The MR estimate after day 3 indicated that 20,759 fish had crossed the border; this projected to 81,185 fish, well below the preseason forecast.

Statistical week 35 (August 23-29) was opened on three days with a guideline harvest of approximately 1,200 fish. Coho salmon catch rates for the week were below average (56 fbd versus 70 fbd), but sockeye salmon CPUE was the second highest on record. No further fishing time was allocated, again, due to the below average coho salmon catches and Tatsamenie sockeye salmon concerns. A run projection made after day 3 ( 85,548 fish) was near the SW 34 projection. Water levels were slightly above average, and nine licenses fished for the week. A total of 1,506 coho and 2,286 sockeye salmon were caught, which surpassed the sockeye salmon record set in 2005 (1,279 fish).

A four day opening was posted for SW 36 (August 30-September 05) with a weekly guideline harvest of 1,800 coho salmon. By day 3 , the run projection had declined by approximately 10,000 fish to 75,013 fish. No additional fishing time was added as the above border run projection minus the harvest to date was below the escapement target of 70,000 coho salmon. River levels were generally near average and nine licenses fished for the week. A total of 2,511 coho salmon were caught, well above average for this period which was in contrast to the current run projection. The CPUE of 70 fbd was near average ( 79 fbd ). Sockeye salmon catches continued to be strong for the time of the year with a harvest of 1,161 fish. In light of the most recent run projection, it was agreed jointly that

Canada would open the inriver fishery for a 24 hrs period in SW 37 to provide assessment information until the test fishery began the following week. A total of 633 coho salmon were caught for the one day opening and no further commercial fishing time was allocated for the remainder of the season.

## Escapement

## Sockeye Salmon

Spawning escapement of sockeye salmon into the Canadian portion of the Taku River drainage is estimated from the joint Canada/U.S. MR program. Counting weirs operated by DFO at Little Trapper and Tatsamenie lakes and by the TRTFN at Kuthai and King Salmon lakes provide some information on the distribution and abundance of discrete spawning stocks within the watershed.

The sockeye salmon MR program has been operated annually since 1984 to estimate the above border run size, spawning escapement is then estimated by subtracting the inriver harvest. The postseason estimate of above border run in 2015 was 152,372 fish; subtracting the inriver harvest of 19,800 fish (19,715 commercial, 85 Aboriginal, and 49 assessment/test fish) indicates that 132,523 sockeye salmon reached the spawning grounds. Using otolith thermal mark data from Tatsamenie Lake broodstock, it was estimated that 641 of these were enhanced fish. The wild spawning escapement was above average, and above the interim escapement goal range of 71,000 to 80,000 sockeye salmon. The Canyon Island fish wheel catch of 5,069 sockeye salmon was above average.

The sockeye salmon count through the Kuthai Lake weir was 341 fish. An aerial survey did not take place in 2015. The 2015 count was $24 \%$ of the average of 1,423 fish and $21 \%$ of the primary brood year (2010) escapement of 1,626 fish.

The King Salmon Lake weir count of 1,683 fish was just below the average of 1,701 fish and $57 \%$ of the primary brood year escapement estimate

The Little Trapper Lake weir count was 13,253 sockeye salmon, well above both the average of 8,683 fish and the 2010 primary brood year count of 3,347 fish. Run timing was about average, with the peak occurring on August 6. There were no removals for artificial spawning.

The Tatsamenie Lake weir count of 1,537 sockeye salmon was $82 \%$ below the average of 8,739 fish and also below the primary brood year count of 2,032 fish. The run was about two weeks late with the midpoint occurring approximately September 11. Based on thermal mark data noted above, 641 fish or $42 \%$ of the escapement was enhanced. A total of 598 fish were removed for brood stock.

## Chinook Salmon

Spawning escapement of Chinook salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. MR program. Tag application took place from

April 29 through August 3 using fish wheels and drift gillnets to capture fish. The fish wheels were located at Canyon Island and drift gillnets were used in the lower river from the Wright River just upstream of the U.S./Canada border. Catches in the drift gillnet accounted for $69 \%$ of the tags applied. Tag recovery effort consisted of assessment/test or commercial fisheries from May 3 through June 20 (SW’s 19-25), as well as the sockeye and coho salmon commercial fisheries (SW’s 26-37). In addition, there was spawning ground sampling in July through September on the Nakina, Tatsatua, Kowatua, Nahlin, and Dudidontu rivers, as well as on Tseta Creek. Spawning ground data was used to give an inriver run estimate of 31,274 large Chinook salmon resulting in an escapement estimate of 28,827 fish after accounting for inriver harvest.

Aerial surveys of large Chinook salmon to the five escapement index areas were as follows: Nakina 1,340 fish (average); Kowatua 622 fish (average); Tatsamenie 434 fish (below average); Dudidontu 289 fish (average); and Nahlin 612 fish (below average). Viewing conditions were good to excellent for all surveys and the total peak count of 3,297 large Chinook salmon which expands to 17,144 large fish using an expansion factor of 5.2.

The carcass weir on the Tatsatua River operated to obtain tag and age, sex, and length data. A total of 264 large Chinook salmon were encountered, either on the weir or through supplemental angling, and this was below average. Comparisons between years should be made cautiously as water levels, effort and fish distribution can have a significant effect on the numbers of fish observed.

## Coho Salmon

Spawning escapement of coho salmon in the Canadian portion of the Taku drainage was estimated from the joint Canada/U.S. MR program. Tag application occurred from July 6 until October 3 (SW 40) and recovery occurred until October 9 (SW 41). The tag recovery effort consisted of the commercial fishery followed by a four week test fishery which commenced September 13 (SW 38) and caught approximately 500 fish per week. The postseason inriver MR estimate was 70,361 fish. Taking into account the inriver harvest of 10,183 fish ( 7,886 commercial, 299 Aboriginal, and 1,998 assessment/test fish) the spawning escapement estimate was 60,178 fish. This was $57 \%$ of the average ( 105,539 fish) and below the 2015 escapement objective of 70,000 fish.

## Pink Salmon

There is no program to estimate the escapement of Taku River pink salmon; however, the Canyon Island fish wheels were used as an index of escapement. A total of 24,246 pink salmon were captured in the fish wheels in 2015; this was well above the average (10,348 fish).

## Chum Salmon

Chum salmon escapement numbers to the Taku River are unknown; however, the numbers of fall chum captured by the fish wheels at Canyon Island were used as an index of
escapement. A total of 95 chum salmon were captured in the wheels in 2015, which was below average.

## Sockeye Salmon Run Reconstruction

An estimated 40,904 wild and 194 enhanced Taku sockeye salmon were harvested in the traditional U.S. District 111 drift gillnet fishery. This estimate was made by postseason GSI analysis. An additional 893 wild and 7 sockeye salmon were estimated to have been taken in the U.S. inriver personal use fishery. The estimated total U.S. harvest of Taku sockeye salmon was 41,797 wild and 201 enhanced fish (Table 5).

In the Canadian commercial fishery, the postseason harvest estimate of Taku sockeye salmon was 19,592 wild and 123 enhanced Tatsamenie Lake fish. Also, harvested was 32 from the Stikine, and no fish from U.S. domestic stocks; total Canadian commercial harvest was 19,747 (19,715 Taku fish and 32 non-Taku enhanced fish). An estimated 84 wild and 1 enhanced sockeye salmon were taken in the Canadian Aboriginal fishery. Therefore, the estimated Canadian treaty harvest of Taku sockeye salmon was 19,676 wild and 124 enhanced fish (Table 5). The test fisheries harvested 49 fish.

The postseason estimate of the above border run size of sockeye salmon, based on the joint Canada/U.S. MR program was 152,372 fish. Deducting the Canadian inriver harvest noted above from the above border run estimate results in an estimated escapement of 132,523 sockeye salmon; 131,882 wild fish. The escapement of Taku River sockeye salmon originating from the fry planting program was estimated to be 641 fish from brood stock otoliths collected at Tatsamenie Lake. The terminal run of Taku River sockeye salmon was estimated at 194,371 fish; 193,405 wild and 967 enhanced fish. Based on the escapement goal of 75,000 fish, the wild AC was 118,405 fish and combining wild and enhanced terminal run the TAC was 119,371 sockeye salmon. The harvest sharing agreement based on total terminal enhanced run was $80 \%$ U.S. and $20 \%$ Canada.

#### Abstract

ALSEK RIVER Alsek River salmon stocks contribute to the U.S. commercial gillnet fisheries located in Dry Bay, at the mouth of the Alsek River (Figure 3). Unknown quantities of Alsek River origin fish may also be taken in the U.S. commercial gillnet and troll fisheries in the Yakutat area. No commercial fishery exists in the Canadian portions of the Alsek River drainage, although Aboriginal and recreational fisheries occur in the Tatshenshini River and some of its headwater tributaries (Figure 3).

## Harvest Regulations \& Management Objectives

Although harvest sharing of Alsek River salmon stocks between Canada and the U.S. has not yet been specified, Annex IV does call for the development and implementation of cooperative abundance-based management plans and programs for Alsek River Chinook and sockeye salmon. In February 2013, the bilateral TTC and bilateral TBR Panel agreed to the revised biological escapement goals for Alsek River Chinook and sockeye salmon. These were: Alsek River Chinook salmon MSY target of 4,700 fish (escapement goal range 3,500-5,300 fish), Klukshu River Chinook salmon MSY target of 1,000 fish (escapement goal range of 800-1,200 fish), Alsek River sockeye salmon MSY target of 29,700 fish (escapement goal range of 24,000-33,500 fish), and Klukshu River sockeye salmon MSY target of 9,700 fish (escapement goal range 7,500-11,000 fish). The principle escapementmonitoring tool for Chinook and sockeye salmon stocks on the Alsek River is the Klukshu weir, operated by the DFO in cooperation with the Champagne-Aishihik First Nation (CAFN). The weir has been in operation since 1976. To make the management objectives of Chinook and sockeye salmon better defined in terms of Klukshu stocks, the revised goals, expressed in terms of Klukshu escapements, were used in 2015. Mark-recapture programs to estimate the total inriver abundance and the fraction of the escapement contributed by the Klukshu stocks were in operation since 1997 for Chinook salmon and since 2000 for sockeye salmon. These however were discontinued in 2005. Currently, total Alsek River run estimates for Chinook and sockeye salmon are generated using GSI analysis and the expansion of the Klukshu River weir counts.

Figure 3. The Alsek River and principal U.S. and Canadian fishing areas.

## Preseason Forecasts

The Klukshu River Chinook salmon escapements in 2009 and 2010 were 1,571 and 2,358 fish, respectively. For comparison, the average is approximately 1,100 Chinook salmon. Based on the primary brood year escapements, the production outlook for 2015 was 2,000 fish (reduced by $15 \%$ to account for forecast error) Klukshu River Chinook salmon, above the average of approximately 1,400 fish and above the revised escapement goal range.

The 2015 Alsek River sockeye salmon run was expected to be approximately 84,000 fish; this was above the average run size estimate of approximately 63,000 sockeye salmon. The outlook for 2015 was based on a predicted run of 19,400 Klukshu River sockeye salmon
derived from the latest Klukshu River stock-recruitment data (2011 Eggers et al.) and an assumed Klukshu River contribution to the total run of $23 \%$, which was based on MR results (2000-2004) and run size estimates using GSI (2005-2006, 2011-2014). Principal contributing brood years were 2010 (Klukshu River escapement of 18,550 sockeye salmon) and 2011 (Klukshu River escapement of 20,800 sockeye salmon); the average Klukshu River sockeye salmon escapement was approximately 14,500 fish. Based on the current stock-recruitment analysis, the range of Klukshu River escapements that appears most likely to produce optimum yields is 7,500 to 11,000 sockeye salmon.

The Klukshu River early sockeye salmon run counts in 2010 and 2011 were 5,073 and 5,635 fish, respectively. The average count was approximately 2,500 sockeye salmon which is above the minimum management target of 1,500 fish used by DFO. The early run to the weir was expected to be above this level in 2015.

The coho salmon partial escapement estimates at the Klukshu River weir in 2011 (2,110 fish) and 2012 (1,270 fish) suggested the run in 2015 would be above average. The recent average weir count was approximately 2,000 coho salmon.

## U.S. Fisheries

Preseason expectations were for average to above average runs for both sockeye and Chinook salmon. These projections were based on parent-year escapements to the Klukshu River. In 2015, the Alsek River recorded an above average run for sockeye salmon and the escapement goal was attained. Chinook salmon runs were also above average in 2015, and the escapement goal as measured at the Klukshu River was achieved.

In 2015 management decisions were made by monitoring fishery performance data and comparing it to historical CPUE for a given opening to adjust time and area openings. The Alsek River commercial fishery opened on June 7 for one day. The sockeye salmon harvests were above average and the Chinook salmon harvests were below average. Fifteen permits harvested 75 Chinook and 381 sockeye salmon during the first opening. Peak sockeye salmon harvest occurred during SW 28 with 12 permits harvesting 5,147 fish. Effort started to decline by SW 32 and by SW 33 coho salmon management strategies were in place. Coho salmon are targeted starting in mid-August and effort becomes minimal. Fishing times remained at three days per week from SW 33 through SW 39. Commercial fishing was opened 7 days a week from SW 40 until the season closed on October 28. The river was not fished during those last four weeks of the season.

The 2015 Dry Bay commercial set gillnet fishery harvested 243 Chinook and 16,104 sockeye salmon (Table 9). No coho, pink, or chum salmon were harvested in 2015. A test fishery for Chinook salmon was conducted in the Alaska portion of the Alsek River in 2005-2008 and from 2011-2012. The test fishery for Chinook salmon was not conducted in 2014 or in 2015.

## Canadian Fisheries

Due to the absence of a harvest monitor position in 2015, catches from the food fishery were estimated based on fishery performance data compared with the weir counts. The harvest estimate for 2015 was comprised of the fish taken from the Klukshu River weir (elders only) and an estimate of catches above/below the weir (based on the past relationship with the weir count and harvest). An estimated 87 Chinook, 1,084 sockeye and no coho salmon were harvested in the food fishery. The recent average catches are 57 Chinook, 1,109 sockeye, and 6 coho salmon.

Catch estimates for the Tatshenshini River recreational fishery were an estimated 44 Chinook salmon retained (48 fish released), and no sockeye salmon were retained (20 fish released). There were no recorded coho salmon caught although this is considered incomplete as fishing may have taken place after monitoring had ceased. These catches were $98 \%$ of average for Chinook and $0 \%$ for sockeye and coho salmon.

Management of salmon in Yukon is a shared responsibility between DFO and the Salmon Sub-Committee (SSC). The SSC was established in 1995 pursuant to the Comprehensive Land Claim Umbrella Final Agreement between the Government of Canada, the Council for Yukon Indians and the Government of the Yukon. The Committee is a public board consisting of ten members, $70 \%$ of which are appointed by Yukon First Nations. Two CAFN members sit on the SSC. Although the Committee currently operates by consensus, the voting structure of the Committee is organized so that, should a vote be necessary, $50 \%$ of the votes reside with appointees of Yukon First Nations.

Table 9. Harvest and Klukshu index escapement data for Alsek River sockeye, Chinook, and coho salmon for 2015.

|  | Chinook | Sockeye | Coho |
| :---: | :---: | :---: | :---: |
| Escapement Index ${ }^{\text {a }}$ |  |  |  |
| Klushu Weir count | 1,432 | 11,588 | 1,810 |
| Klushu Escapement | 1,388 | 11,363 | 1,810 |
| Harvest ${ }^{\text {b }}$ |  |  |  |
| U.S. Commercial | 243 | 16,104 | 11 |
| U.S. Subsistence/P.U. | 5 | 111 | 6 |
| U.S. Test | 0 | 0 | 0 |
| Canadian Aboriginal | 87 | 1,084 | 0 |
| Canadian Recreational | 44 | 0 | 0 |
| Total harvest | 379 | 17,299 | 17 |

${ }^{\text {a }}$ Klukshu River salmon stocks represent an assumed large and variable portion of the total Alsek River salmon escapement.
${ }^{\mathrm{b}}$ U.S. harvest estimate differs from Joint Interception Committee estimate because no estimates are made for harvest other than the listed fisheries.

The 2015 Alsek-Tatshenshini management plan, adopted by CAFN, SSC, and DFO, was based on the escapement objectives described in the Harvest Regulations \& Management Objectives section above. For Chinook and early run sockeye salmon management, the status of the Klukshu weir counts was reviewed about July 18 to ensure weir and spawning escapement targets were on track. The status of the late run sockeye salmon was also reviewed in the first week of September. Adjustments to inseason fishing regimes in the recreational and Aboriginal fisheries in 2015 were not deemed necessary as escapement needs were projected to be met. Additionally, there were no significant surpluses that warranted liberalization of the possession limits in the recreational fishery. Other key elements of the plan are described below.

The center of Aboriginal fishing activity in the Alsek River drainage occurs at the CAFN village of Klukshu, on the Haines Road, about 60 km south of Haines Junction. Salmon are harvested by means of gaff, small gillnets, sport rods, and traditional fish traps as the fish migrate up the Klukshu River and into Klukshu Lake. The fishing plan for the Aboriginal fishery in the Klukshu River and adjacent areas allowed for fishing by any means (as established in the communal license) 7 days a week. Conservation thresholds that might invoke restrictions in the Aboriginal fishery were projected Klukshu weir counts of < 800 Chinook, < 1,500 early, and < 7,500 total sockeye salmon. Food fisheries also exist on Village Creek and in the headwaters of the Tatshenshini River and tributaries thereof (Goat Creek, Stanley Creek, Parton River, and the Blanchard River). The plan did not restrict the fishery other than to reserve harvests of Chinook salmon at Goat Creek, Stanley Creek, and the Parton River for elders only.

The majority of the recreational fishing effort on the Alsek drainage occurs in the Tatshenshini River, at and just downstream of the mouth of the Klukshu River in the
vicinity of the abandoned settlement of Dalton Post. The management plan prohibited the retention of sockeye salmon in the recreational fishery prior to August 15 unless the weir count projection for the early run was $>4,500$ sockeye salmon. The Chinook salmon daily catch limit was one per day, two in possession. For other salmon species, the daily catch and possession limits were two and four fish, respectively. However, the aggregate limit for all salmon combined was two salmon per day, four fish in possession. Recreational salmon fishing was permitted in the Tatshenshini River seven days a week. Headwater areas in the vicinity of the British Columbia/Yukon border were to be closed in late July to protect spawning Chinook salmon. Conservation thresholds that were expected to invoke additional restrictions in the recreational fishery were projected Klukshu weir counts of < 1,000 Chinook and < 10,500 sockeye salmon (early and late runs combined).

A mandatory Yukon Salmon Conservation Catch Card (YSCCC), introduced by the SSC in 1999, was required by all recreational salmon fishers in 2015. The purpose of the YSCCC is to improve harvest estimates and to serve as a statistical base to ascertain the importance of salmon to the Yukon recreational fishery. Anglers are required to report their catch via mail by the late fall. Information requested includes the number, sex, size, date and location of salmon caught and released.

Since 2001, CAFN has imposed a fishing area closure from the Klukshu River bridge crossing up to the new weir location to allow for better staging opportunities for salmon in the vicinity of the Klukshu/Tatshenshini confluence.

## Escapement

Total drainage abundance programs are being investigated as part of the development of abundance-based management regimes and to accurately assess whether the escapement goals for Alsek River Chinook and sockeye salmon stocks are appropriate and if so, are being achieved. At this time, there are no programs in place to estimate the drainage-wide coho salmon escapement. A large and variable proportion of the drainage-wide escapement of each species is enumerated at the weir on the Klukshu River. Current escapement monitoring programs including the Klukshu weir, Village Creek electronic counter, GSI based run reconstructions, and aerial surveys allow annual comparisons of escapement indices. The most reliable long-term comparative escapement index for Alsek River drainage salmon stocks is the Klukshu River weir count. Escapements for 2015 are shown in Table 9.

## Sockeye Salmon

In 2015, the Klukshu River sockeye salmon weir count was 11,588 fish and the escapement estimates was 11,363 (Table 9). The count of 2,604 early run fish (count through August 15) was above the average of 2,498 fish as was the count of 8,984 late run fish with an average of 8,361 . The total escapement of 11,363 fish was above the upper end of the recommended escapement goal range of 7,500 to 11,000 fish. No sockeye salmon count was obtained at Village Creek in 2015 due to technical issues with the video counting system.

## Chinook Salmon

The most reliable comparative Chinook salmon escapement index for the Alsek River drainage is the Klukshu River weir count. In 2015, the Chinook salmon weir count was 1,432 fish and the escapement estimate was 1,388 fish (Table 9). The 2015 escapement estimate was above the escapement goal range of 800 to 1,200 Klukshu Chinook salmon.

## Coho Salmon

The Klukshu River coho salmon weir count was 1,810 fish. As in past years, the weir count cannot serve as a reliable run strength indicator as the weir is normally removed well before the end of the coho salmon run to the Klukshu River.

## ENHANCEMENT ACTIVITIES

## Egg Collection

In 2015, sockeye salmon eggs were collected at Tahltan Lake on the Stikine River for the twenty-seventh year and in the Tatsamenie Lake system on the Taku River for the twentysixth year of this program.

## Tahltan Lake

In 2015, Tahltan Fisheries were contracted to perform the egg take. The egg-take goal had been set at 6.0 million eggs in the approved Stikine River Enhancement Plan. Prior to the start of the season Canada advised Alaska that they were revising the goal to 5.5 million because of a decision they had made to not stock sockeye salmon fry into Tuya Lake based on domestic issues; Canadian technical staff determined that the fry from a 5.5 million level egg take could all be planted into Tahltan Lake without exceeding agreed to treaty stocking guidelines. A total of 1,770 females and 1,772 males were spawned over the course of 12 egg take days conducted from September 4th to 27th. This produced approximately 4.83 million sockeye salmon eggs for delivery to Snettisham Hatchery in Alaska (based on an estimated fecundity of 2,730). This year's total egg take of 4.83 million eggs fell short of the 2015 Canadian egg take target of 5.5 million eggs, but is higher than both the 2014 egg take of 3.73 million eggs and the long-term yearly average (since 1989) of 4.58 million eggs. Despite extending fishing two days beyond the guideline last fishing day low catches of female sockeye and ripe females limited egg takes during the first half of the egg take project. Two of the twelve lots of eggs being transported to the hatchery were delayed by one day due to weather, and four were delayed by two days. The eggs looked good upon arrival at Snettisham Hatchery and egg survival to 100 CTU was $85.3 \%$. Egg count at the hatchery indicated an actual egg take total of 4.5 million vs 4.83 million due to a significantly lower than average fecundity in 2015 which was observed at both Tahltan and Tatsamenie lakes (lowest on record).

Tatsamenie Lake

In 2015, B. Mercer and Associates Ltd was contracted to collect eggs at Tatsamenie Lake. Broodstock was captured for the twenty-first year near the assessment weir at the outlet of Tatsamenie Lake and held until ripe. Escapement through the weir was 1,537 fish, with about 920 fish (60\%) being females. An estimated 731,000 sockeye salmon eggs were delivered from Tatsamenie Lake to Snettisham Hatchery for incubation and thermal marking. While this fell short of the bilaterally agreed-to egg-take goal of 2.0 million eggs in the approved Taku Enhancement Production Plan; it was the maximum eggs that could be collected without exceeding the recognized Canadian regulation restricting broodstock to no more than $30 \%$ of escapement. Two of the four lots of eggs being transported to the hatchery were delayed by a day due to weather. These delays are largely due to short day length in the late fall. Average egg survival to 100 CTU was $82 \%$.

## King Salmon Lake

In 2015, no eggs were collected.

## Incubation, Thermal Marking, and Fry Plants

Snettisham Hatchery is operated by DIPAC, a private aquaculture organization in Juneau. A cooperative agreement between ADF\&G and DIPAC provides for Snettisham Hatchery to serve the needs of the joint TBR enhancement projects.

Egg incubation and thermal-marking at Snettisham Hatchery went smoothly in 2014/2015. In 2015, brood year 2014 fry were transported to the appropriate systems from May 18 to May 30. There were modest IHNV losses of the 2014 brood year. An estimated 169,700 Tatsamenie fry in a single incubator were confirmed positive with IHNV and destroyed.

## Tahltan Lake

In 2015, a total of 2.68 million sockeye salmon fry were stocked back into Tahltan Lake. These fish were from eggs collected in Tahltan Lake in the fall of 2014. Survival from green-egg to stocking fry was $76 \%$. Fry stocking took place on May 18, 19 and 20.

## Tuya Lake

In 2015 no fry were stocked in Tuya Lake due to Canadian domestic concerns.

## Tatsamenie Lake

In 2015, a total of 917,500 sockeye salmon fry were stocked in Tatsamenie Lake. These fish were from eggs collected at Tatsamenie Lake in the fall of 2014. Survival from greenegg to stocked fry was $87 \%$. Approximately 731,000 sockeye salmon fry were released directly into the lake on May 22nd. Approximately 187,000 sockeye salmon fry were delivered to four onshore extended rearing tanks, located near the northeast end of the lake, on May 30th at 0.99 grams. Elevated mortality was noted on June 6th. A pathology sample was sent to Nanaimo and several treatments were tried without effect. On June 26, a seven day antibiotic treatment was started which stabilized the mortality rate. The intended lake
net pen rearing portion of the onshore project was cancelled as a precautionary measure. Approximately 172,000 sockeye salmon fry were released from the onshore tanks directly into the lake at 1.4 grams. Fry were released in batches of approximately 5,000 fry into littoral zone habitat in the northern half of the lake. A second group of 45,000 sockeye salmon fry, from the May 22nd delivery, were to be long-term reared in net pens in the lake. While showing no signs of the increased mortality seen in the onshore tanks, the lake net pen fry were released on June 12 at 0.8 grams as a precautionary measure. This was the seventh year of this program. Full evaluation of the success of this study will not be available until these fish return as adults.

## King Salmon Lake

On May 23, 2015 approximately 169,000 sockeye salmon fry were released into King Salmon Lake at 0.2 grams. These fish were from eggs collected in King Salmon Lake in the fall of 2014. The survival from green egg to stocked fry was $89 \%$.

## Sockeye Supplementation Evaluation Surveys

## Acoustic, Trawl, Beach Seine and Limnological Sampling

Standard limnological surveys were conducted at Tatsamenie and Tahltan lakes. No surveys were conducted on Tuya or Trapper lakes. No hydroacoustic surveys were conducted in 2015.

## Thermal Mark Laboratories

## ADF \& G Thermal Mark Laboratory

During the 2015 season, the ADF\&G Thermal Mark Lab processed 18,468 sockeye salmon otoliths collected by ADF\&G and DFO staff as part of the U.S./Canada fry-stocking evaluation program. These collections came from commercial and test fisheries in both U.S. and Canadian waters on the Taku and Stikine rivers over a 14 -week period. The laboratory provided estimates on hatchery contributions for 86 distinct sample collections. Estimates of the percentage of hatchery fish contributed to commercial fishery catches were provided to ADF\&G and DFO fishery managers 24 to 48 hours after samples arrived at the lab.

Contribution estimates of stocked fish to Alaskan harvest were 14,365 stocked Stikine River fish to District 106 and 108 gillnet fisheries, and 201 stocked Taku River fish to District 111 gillnet fisheries. Estimates of contributions to Canadian fisheries included 28,785 stocked fish to Stikine River fisheries and 124 stocked fish to the Taku River fisheries.

## Canadian Thermal Mark Laboratory

Subsamples of juvenile and adult otolith samples collected at the study lakes during the 2015 season are being analyzed at the DFO thermal mark lab in Whitehorse.

## APPENDICES

## Standards

Large Chinook salmon are MEF length $\geq 660 \mathrm{~mm}$
Unless otherwise stated Chinook salmon are large
Test fisheries for Chinook salmon became commercial assessment/test fisheries starting in 2004
Data not available to estimate harvests of Alaska Hatchery pink and chum salmon
All harvests of Tahltan, Trapper, and Tatsamenie lakes, unless otherwise noted, include both wild and hatchery fish.
Bold numbers are incomplete numbers
Italicized numbers are used when the GSI estimates do not meet acceptable levels of precision and accuracy agreed upon by the TTC (April 2013): to estimate the proportion of mixtures within $10 \%$ of the true mixture $90 \%$ of the time.

Appendix A. 1. Weekly harvest of Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2015.

Appendix A. 11. Harvest by stock and week for sockeye salmon in the Canadian upper river commercial and Aboriginal fisheries in the Stikine River, 2015.
In the absence of otolith analysis the fraction of Tuya, Tahltan wild, and Tahltan enhanced was calculated based on the lower River fraction
from the previous week (used week 25 fraction from lower river for both weeks 24-25)

Appendix B. 3. Annual harvest of Stikine River large Chinook salmon in the U.S. gillnet, troll, recreational, and subsistence and estimates of Stikine River bound Chinook salmon in District 108, 2005-2015.
GSI used for sport and gillnet. Troll is based on GSI 2005-2008 and CWT 2009-present.
For detailed GSI stock comp estimates see Appendix G. 5.

Appendix B. 18. Estimated proportion of inriver run comprised of Tahltan, Tuya, and mainstem sockeye salmon, 1979-2015
In 1979-1988, there were US estimates and 1983-1988, they overlapped with estimates from Canada and the All tahltan estimate was oftened averaged. The estimates are from the LRCF, test, or average of LRCF and Test.

## Appendix D. 4. Taku River large Chinook salmon run size, 1979-2015.

Run estimate does not include spawning escapements below the U.S./Canada border. U.S. harvest estimates after 2004 are based on GSI (gillnet and sport fish) and CWT (troll) and harvest in the fisheries between SW 18-28.

Appendix D. 19. Escapement counts of Taku River coho salmon. Counts are for age-. 1
fish and do not include jacks, 1984-2015.
Because of variability between methods, visibility, observers, and timing, these counts are not an index of run strength.
