## REPORT OF THE <br> INTERNATIONAL PACIFIC SALMON FISHERIES COMMISSION FOR THE YEAR 1977

The Annual Report for 1974 described some of the changes that have taken place in the sockeye fishery over a period of 20 years and the effects of these changes on the traditional net fisheries within Convention Waters. In 1977 a substantial increase occurred in the proportion of the harvest of pink salmon by Canadian troll fisheries in Convention Waters west of the Bonilla-Tatoosh Line. This troll catch amounted to $47.3 \%$ of the Canadian Convention Waters catch of pink salmon, compared to the previous high of $24.8 \%$ in 1969 (Table 1). The 1977 Canadian West Coast troll catch in Convention Waters exceeded the previous record catch made in 1967, and the exploitation rate of $13.65 \%$ was the highest yet recorded (Table 2).

Table 1. Canadian troll catch of pink salmon in Convention Waters west of Bonilla Line and percentage of Canadian Convention Waters catch.

| Year | Troll <br> Catch | Canadian Convention <br> Waters Catch | Percent <br> Troll |
| :--- | ---: | :---: | :---: |
| 1957 | 40,867 | $2,634,720$ | 1.55 |
| 1959 | 186,295 | $2,312,906$ | 8.05 |
| 1961 | 54,161 | 545,128 | 9.94 |
| 1963 | 350,749 | $4,173,288$ | 8.40 |
| 1965 | 68,544 | 592,467 | 11.57 |
| 1967 | 920,092 | $4,156,922$ | 22.13 |
| 1969 | 213,920 | 861,505 | 24.83 |
| 1971 | 420,309 | $2,137,337$ | 19.67 |
| 1973 | 415,476 | $2,060,679$ | 20.16 |
| 1975 | 222,675 | $1,255,890$ | 17.73 |
| 1977 | 982,517 | $2,075,478$ | 47.34 |

* Data for years 1969-77 includes small catches in Area 20.

Table 2. Exploitation of pink salmon by Canadian troll fisheries in Convention Waters west of the Bonilla-Tatoosh Line.

|  | 1959 | 1901 | 1963 | 1965 | 1967 | 1969 | 1971 | 1973 | 1975 | 1977 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |
| Total Stock Available <br> in Convention Waters <br> (millions) | 6.31 | 3.47 | 15.46 | 2.99 | 10.00 | 3.21 | 6.60 | 6.25 | 3.80 | 7.20 |
| Troll Exploitation <br> (percent) | 2.95 | 1.56 | 2.27 | 2.29 | 9.20 | 6.66 | 6.37 | 6.65 | 5.86 | 13.65 |

As a consequence of the higher exploitation rate and the smaller stock size, the outside troll catch proportion of the catch in 1977 was over twice as large as in 1967. The catch by Canadian trollers north of Convention Waters in 1977
was a record 832,100 pinks, nearly double the catch in 1967, and the percentage of Canadian harvest of pinks made in this area reached a record $28.62 \%$ (Table 3 ). The increases in troll catch since 1957 have resulted in a decline in the percentage of harvest of southern approach pinks by Canadian fishermen in Convention Waters east of the Bonilla Line from $97 \%$ in 1957 to $37.6 \%$ in 1977.

Table 3. Catches of pink salmon from southern approach stocks by Canadian fishermen in Convention Waters and in the non-Convention Waters troll fishery.

| Year | Convention Waters |  |  |  | Non-Convention Waters |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | East of Bonilla | \% | West of Bonilla Troll | \% | Lat. $48^{\circ} \mathrm{N}$ to Cape Scott Troll* | \% | Total |
| 1957 | 2,593,853 | 97.07 | 40,867 | 1.53 | 37,500 | 1.40 | 2,672,220 |
| 1959 | 2,126,611 | 87.02 | 186,295 | 7.62 | 130,960 | 5.36 | 2,443,866 |
| 1961 | 490,967 | 77.81 | 54,161 | 8.58 | 85,870 | 13.61 | 630,998 |
| 1963 | 3,822,539 | 86.70 | 350,749 | 7.96 | 235,576 | 5.34 | 4,408,864 |
| 1965 | 523,923 | 82.66 | 68,544 | 10.81 | 41,397 | 6.53 | 633,864 |
| 1967 | 3,236,830 | 70.73 | 920,092 | 20.10 | 419,437 | 9.17 | 4,576,359 |
| 1969 | 647,585 | 56.28 | 213,920 | 18.58 | 289,727 | 25.17 | 1,151,232 |
| 1971 | 1,717,028 | 64.54 | 420,309 | 15.80 | 523,222 | 19.68 | 2,660,559 |
| 1973 | 1,645,203 | 66.65 | 415,476 | 16.83 | 407,843 | 16.52 | 2,468,522 |
| 1975 | 1,033,215 | 61.57 | 222,675 | 13.27 | 422,320 | 25.16 | 1,678,210 |
| 1977 | 1,092,461 | 37.58 | 982,517 | 33.79 | 832,332 | 28.63 | 2,907,310 |

* Data from Canada Fisheries Service.

The increasing share of catch by the outside troll fishery and the decreasing share of catch by the inside net fisheries in all Convention Waters is of great concern to the net fishermen. The net fisheries are subject to restrictive weekly regulations to obtain division of catch and the required escapement, wheneas the outside troll fishery is subject only to an overall season regulation. The net fishermen have advised the Commission of their contention that regulatory control for management of the sockeye and pink salmon stocks should apply to the outside troll fisheries also. The Commission has been concerned about this question for a number of years and has advised the governments of this concern on two occasions. Starting in 1971, the troll fishery in Area 20 has been limited to the same days as the net fishery during the period of Commission control. Regulations applicable to the Convention Waters west of the Bonilla-Tatoosh Line could be recommended, but such regulations probably would be of little practical value if the adjacent non-Convention Waters were not similarly regulated. The Commission believes, as a matter of principle, that all fisheries in Convention Waters should be subject to management requirements for conservation and division of catch. The relative freedom of the troll fishery from management controls to date, if continued, will have increasing impact on the inside net fisheries.

## COMMISSION MEETINGS

The International Pacific Salmon Fisheries Commission held twenty-two formal and twenty-one telephone meetings during 1977 with the approved minutes of the meetings being submitted to the Governments of Canada and the United States.

Commissioner Donald W. Moos resigned in September 1977 and Mr. Gordon Sandison, Director of Washington State Department of Fisheries, was appointed the new United States Commissioner. At the end of 1977, the Commission membership was as follows:

## Canada

W. R. Hourston

Richard A. Simmonds

United States
Donald R. Johnson
William G. Saletic
Gordon Sandison

At the February 4 meeting, the Commission appointed Mr. Tom Philpott as alternate member of the Advisory Committee for the balance of Mr. Glenn Schuler's appointment representing United States Reef Net Fishermen. The Commission also approved the appointment of Mr. Gerald Simmons for another four-year term as Advisory Committee member representing United States Troll Fishermen. Advisory Committee member Mr. Lloyd Monk passed away suddenly on March 4 and Mr. Jack O'Connor was appointed June 27 to complete the term as the Canadian representative for Salmon Processors. At the end of 1977, the membership of the Advisory Committee was as follows:

Canada<br>J. Brajcich<br>Purse Seine Fishermen<br>J. O'Connor<br>Salmon Processors<br>F. Nishii<br>Gill Net Fishermen<br>N. Carr<br>Purse Seine Crew Members<br>M. Guns<br>H. English<br>Sport Fishermen

G. Simmons

Troll Fishermen
E. Engman

Sport Fishermen

The first meeting of 1977 was held February 4 with Mr. Donald R. Johnson serving as Chairman and Mr. W. R. Hourston as Vice-Chairman and Secretary. The Commission met with government officials and the Advisory Committee regarding the tentative recommendations for regulatory control of the 1977 sockeye and pink salmon fishery in Convention Waters, as submitted to the Committee by the Commission on December 10, 1976. The regulations were moved for adoption as submitted to the industry on December 10,1976 , but failed to get the
required approval of the Commission. Further discussion of the regulations was deferred until the next Commission meeting. The Commission met with the Secretary of the Pension Society and approved the revised retirement proposal of the Society.

On March 25 the Commission met with the Advisory Committee to discuss a proposal from the United States Government to amend the Commission's tentative regulations. After discussion, the proposal was unanimously opposed by all the Adrisory Committee and it was the concensus of the Advisory Committee that the Commission should proceed with the regulations it had submitted to the industry at the December 1976 Annual Meeting. The Commission agreed that the Commissioners of each country should discuss this matter further with their respective governments. The budget for fiscal year 1977-78 was approved by the Commission.

The Commission met at Chilko Lake on May 6 to view the sockeye fry and smolt migrations. The draft for the 1976 Annual Report was approved.

On June 1 the Commission met in Richmond, British Columbia, to discuss the proposed 1977 regulations. The Commission reriewed comments made by the Advisory Committee at the February 4 meeting and after certain revisions, approved the recommended regulations for submission to the two national governments. The Commission approved a recommendation to the Minister of Fisheries and the Environment that the Indian Food Fishery at the Nautley and Stella Reserves be limited to one day per week from July 25 to August 10, to protect the escapement of the Early Nadina sockeye.

The Commission met June 27 and reviewed correspondence that was received from the United States Government approving the Commission's regulations for the 1977 sockeye and pink salmon fishery in Convention Waters, with the exception of United States Indians, "who are entitled to exercise fishing rights by virtue of treaties with the United States in United States Convention Waters and are fishing in accordance with federal regulations providing for the exercise of such fishing rights".

The Commission also discussed regulations from the Federal Register by the National Marine Fisheries Service and the Bureau of Indian Affairs concerning Indian fishing time in United States Convention Waters. The Commission also approved an emergency order that its regulations for 1977 in United States Convention Waters apply to all citizens without exception.

During the period July 4 to October 7 inclusive, the Commission held fourteen formal and twenty-one telephone meetings for adjustment of fishing regulations to achieve the desired escapement and, as nearly as practicable, equitable division of the allowable catch of Fraser River sockeye and pink salmon.

On July 8 the Commission met with a representative of Washington State Department of Fisheries to review the State's catch reporting procedures. On July 15 the Comimission met with representatives of the State, the Bureau of Indian Affairs and the National Oceanic and Atmospheric Administration to discuss the catch reporting question. On July 22 the Commission passed an Emergency Order that when fishing is closed under Commission regulations, the catching or taking of sockeye and pink salmon is prohibited. On August 11 the Commission met with its Advisory Committee and representatives of the governments of Canada and the United States to discuss the action of the United States with respect to the Commission's regulations for 1977 and other factors bearing on the management of the sockeye and pink runs by the Commission. On August 26 the Commission, accompanied by members of the Advisory Committee, inspected the sockeye spawning in the Horselly River system.

The Commission met October 18 in Bellingham to discuss the problems associated with the unreported catches of sockeye salmon in the commercial fishing area in the Fraser River. It was ascertained that 140,000 sockeye be added to the Canadian catch on this account. A review was made of the troll fishery catches of sockeye in 1974 and of pink salmon in 1977 in Canadian Convention Waters, to consider the problems that may be encountered in 1978.

The Commission met on December 2 to review the Annual Meeting presentation. The twenty-second and final formal meeting of the year was held on December 9 in Vancouver, British Columbia, when the Commission held its Annual Meeting with its Advisory Committee and approximately 400 representatives of industry, government and press. Regulatory problems that occurred during 1977 were reviewed by the Chairman and Vice-Chairman. The catch and escapement statistics for the 1977 sockeye and pink salmon season were presented by the staff. Reports were also presented on the following topics: 1. Production of sockeye and pink salmon from Commission spawning channels; 2. Even year pink salmon research, lake productivity studies, prespawning mortality of Horsefly sockeye, and occurrence of IHN disease in Chilko sockeye; 3. Protection of the environment; and 4. Engineering investigations, including flood damage to Weaver Creek spawning channel. Prospects for the 1978 fishing season were reviewed and tentative regulations for the 1978 fishery were proposed for consideration by the industry and their representatives on the Commission's Advisory Committee.

## 1977 REGULATIONS

Recommendations for regulations governing the 1977 sockeye and pink salmon fishery in Convention Waters were adopted at a meeting of the Commission held on June 1, 1977 and were submitted to the two national governments for approval on June 1, 1977. The recommendations for Canadian Convention Waters were implemented during the fishing season under the Fisheries Act, British Columbia Fishery Regulations and subsequently by Order-in-Council dated November 24, 1977. On June 17, 1977, the United States Government informed the Commission regarding its recommended 1977 regulations as follows: "The United States Government has approved the recommended regulations except as
to U.S. Indians who are entitled to exercise fishing rights by virtue of treaties with the United States in U.S. Convention Waters and are fishing in accordance with Federal regulations providing for the exercise of such fishing rights." The National Marine Fisheries Service was designated as the enforcing agency in cooperation with other federal agencies.

The recommendatons of the Commission were as follows:

## Canadian Convention Waters

"The International Pacific Salmon Fisheries Commission appointed pursuant to the Convention between Canada and the United States of America for the protection, preservation and extension of the Sockeye Salmon Fisheries of the Fraser River System, signed at Washington on the 26th day of May, 1930, as amended by the Pink Salmon Protocol signed at Ottawa on the 28th day of December, 1956, hereby recommends that, in the interests of such fisheries, the following Fraser River Sockeye and Pink Salmon Fishery Regulations for the season of 1977 be adopted by Order-in-Council pursuant to Section 34 of the Fisheries Act, namely:

1. (1) No person shall fish for sockeye or pink salmon in the waters of the southerly portion of District No. 3 in that portion of Area 20 lying westerly of a line driawn true south from Sheringham Point Lighthouse to the International Boundary with nets from the 26 th day of June, 1977 to the 23rd day of July, 1977, both dates inclusive.
(2) No pertson shall fish for sockeye or pink salmon with purse seines in the waters described in subsection (1) of this section:
(a) From the 24th day of July, 1977 to the 30 th day of July, 1977, both dates inclusive, except from half past six o'clock in the forenoon to half past six o'clock in the afternoon of Monday; and
(b) From the 31st day of July, 1977 to the 3rd day of September, 1977, both dates inclusive, except from half past six o'clock in the forenoon to half past six o'clock in the afternoon of Monday and Tuesday of each week; and
(c) From the 4th day of September, 1977 to the 17 th day of September, 1977, both dates inclusive, except from seven o'clock in the forenoon to seven o'clock in the afternoon of Monday and Tuesday of each week.
(3) No person shall fish for sockeye or pink salmon with gill nets in the waters described in subsection (1) of this section:
(a) From the 24th day of July, 1977 to the 30th day of July, 1977, both dates inclusive, except from half past six o'clock in the afternoon of Monday to half past six o'clock in the forenoon of Tuesday; and
(b) From the 31st day of July, 1977 to the 3rd day of September, 1977, both dates inclusive, except from half past six o'clock in the afternoon of Monday to half past six o'clock in the forenoon of Tuesday; and from half past six o'clock in the afternoon of Tuesday to half past six o'clock in the forenoon of Wednesday of each week; and
(c) From the 4th day of September, 1977 to the 17 th day of September, 1977, both dates inclusive, except from seven o'clock in the afternoon of Monday to seven o'clock in the forenoon of Tuesday; and from seven o'clock in the afternoon of Tuesday to seven o'clock in the forenoon of Wednesday of each week.
(4) No person shall troll commercially for sockeye or pink salmon in the waters described in subsection (1) of this section from the 24th day of July, 1977 to the 17th day of September, 1977, both dates inclusive, except at times that net fishing may be permitted within that area.
2. No person shall fish for sockeye or pink salmon with nets in the waters of the southerly portion of District No. 3 embraced in Areas 17 and 18:
(1) From the 26 th day of June, 1977 to the 16 th day of July, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week; and
(2) From the 17 th day of July, 1977 to the 6 th day of August, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Wednesday of each week; and
(3) From the 7th day of August, 1977 to the 27 th day of August, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week; and
(4) From the 28th day of August, 1977 to the 10 th day of September, 1977, both dates inclusive, except from eight o"clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week, in the following described waters:
(a) The waters lying westerly of a straight line drawn from Thrasher Rock Light to Law Point on Gabriola Island, thence along the easterly shoreline of Gabriola Island to Josef Point, thence in a straight line to Cordero Point on Valdez Island and along the easterly shoreline of Valdez Island to Vernaci Point, thence in a straight line to Race Point on Galiano. Island and along the easterly shoreline of Galiano Island to Burrill Point, thence in a strajght line to Georgina Point on Mayne Island, thence along the easterly shoreline of Mayne Island to Campbell Point, thence in a straight line to Winter Point on Saturna Island, thence along the easterly shoreline of Saturna Island to East Point, thence due south in a straight line to the International Boundary.
3. No person shall troll commercially for sockeye or pink salmon in that portion of the waters described in section 2 lying easterly of a line from Thrasher Rock Light, thence in a straight line to Salamanca Point on the southerly end of Galiano Island, thence in a straight line to East Point on Saturna Island, thence due south in a straight line to the International Boundary, from the 7th day of August, 1977 to the 27 th day of August, 1977, both dates inclusive, except at the times and locations that net fishing may be permitted within that area.
4. No person shall troll commercially for sockeye or pink salmon in that portion of the waters described in section 2 lying easterly of a straight line from Thrasher Rocik Light to Law Po:nt on Gabriola Island, thence along the easterly shoreline of Gabriola Island to Josef Point, thence in a straight line to Cordero Point on Valdez Island and along the easterly shoreline of Valdez Island to Vernaci Point, thence in a straight line to Race Point on Galiano Island and along the easterly shoreline of Galiano Island to Burrill Point, thence in a straight line to Georgina Point on Mayne Island, thence along the easterly shoreline of Mayne Island to Campbell Point, thence in a straight line to Winter Point on Saturna Island, thence along the easterly shoreline of Saturna Island to East Point, thence due south in a straight line to the International Boundary, from the 28th day of August, 1977 to the 10 th day of September, 1977, both dates inclusive.
5. No person shall fish for sockeye or pink salmon with nets or by commercial trolling in that portion of the watters described in section 2 lying easterly of a straight line from Thrasher Rock Light to Law Point on Gabriola Island, thence along the easterly shoreline of Gabriola Island to Josef Point, thence in a straight line to Cordero Point on Valdez Island and along the easterly shoreline of Valdez Island to Vernaci Point, thence in a straight line to Race Point on Galiano Island and along the easterly shoreline of Galiano Island to Burrill Point, thence in a straight line to Georgina Point on Mayne Island, thence along the easterly shoreline of Mayne Island to Campbell Point. thence in a straight line to Winter Point on Saturna Island, thence along the easterly shoreline of Saturna Island to East Point, thence due south in a straight line to the International Boundary, from the 11th day of September, 1977 to the 30 th day of September, 1977, both dates inclusive.
6. No person shall fish for sockeye or pink salmon with gill nets in the Convention Waters portion of District No. 1:
(1) From the 26 th day of June, 1977 to the 16 th day of July, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week; and
(2) From the 17 th day of July, 1977 to the 6 th day of August, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Wednesday of each week; and
(3) From the 7th day of August, 1977 to the 10 th day of September, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week; and
(4). From the 11th day of September, 1977 to the 24th day of September, 1977, both dates inclusive, except from eight o'clock in the forenoon of Monday to eight o'clock in the forenoon of Tuesday of each week in the following described waters:
(a) Those waters lying westerly of a line projected from Point Grey to the westerly end of the North Arm Jetty, thence to Sandheads Light and thence to the International Boundary at the junction of District No. 1 and Area 17 and Area 18; and
(5) From the 25th day of September, 1977 to the 8 th day of October, 1977, both dates inclusive.
7. No person shall troll commercially for sockeye or pink salmon in that portion of the waters described in section 6 lying east and south of a straight line projected from Gower Point at the westerly entrance to Howe Sound to Thrasher Rock Light, from the 7th day of August, 1977 to the 30th day of September, 1977, both dates inclusive, except at the times and locations that net fishing may be permitted within that area.

All times hereinbefore mentioned shall be Pacific Daylight Saving Time."

## United States Conyention Waters

"The International Pacific Salmon Fisheries Commission appointed pursuant to the Convention between Canada and the United States of America for the protection, preservation and extension of the Sockeye Salmon Fisheries of the Fraser River System, signed at Washington on the 26th day of May, 1930, as amended by the Pink Salmon Protocol signed at Ottawa on the 28th day of December, 1956, hereby recommends to the United States Government that regulations to the following effect in the interest of such fisheries, be adopted for the year 1977, and that an approved copy of said regulations be forwarded to the Director of Fisheries of the State of Washington for implementation by virtue of authority in him vested by Section 6 of Chapter 112 of the Laws of the State of Washington of 1949, namely:

1. (1.) No person shall fish for sockeye or pink salnon with purse seines in the Convention Waters of the United States of America lying westerly of a straight line drawn from Angeles Point in the State of Washington across Race Rocks to William Head in the Province of British Columbia:
(a) From the 26 th day of June, 1977 to the 13 th day of August, 1977, both dates inclusive, except from five o'clock in the forenoon to half past nine o'clock in the afternoon of Monday and Tuesday of each week; and
(b) From the 14 th day of August, 1977 to the 17 th day of September, 1977, both dates inclusive, except from five o'clock in the forenoon to nine o'clock in the afternoon of Minday and Tuesday of each week.
(2) No person shall fish for sockeye or pink salmon with gill nets in the waters described in subsection (1) of this section:
(a) From the 26 th day of June, 1977 to the 2 nd day of July, 1977 ; from the 10 th day of July, 1977 to the 16 th day of July, 1977 ; from the 24 th day of July, 1977 to the 30 th day of July, 1977; and from the 7th day of August, 1977 to the 13 th day of August, 1977, ail dates inclusive, except from seven o'clock in the afternoon of Monday to half past nine o'clock in the forenoon of Tuesday and from seven o'clock in the afternoon of Tuesday to half past nine o'clock in the forenoon of Wednesday of each week; and
(b) From the 3rd day of July, 1977 to the 9 th day of July, 1977; from the 17 th day of July, 1977 to the 23rd day of July, 1977; and from the 31st day of July, 1977 to the 6th day of August, 1977, all dates inclusive, except from seven o'clock in the afternoon of Sunday to half past nine o'clock in the forenoon of Monday and from seven o'clock in the afternoon of Monday to half past nine o'clock in the forenoon of Tuesday of each week; and
(c) From the 14 th day of August, 1977 to the 20 th day of August, 1977; from the 28 th day of August, 1977 to the 3rd day of September, 1977; and from the 11th day of September, 1977 to the 17 th day of September, 1977, all dates inclusive, except from six o'clock in the afternoon of Sunday to nine o'clock in the forenoon of Monday and from six o'clock in the afternoon of Monday to nine o'clock in the forenoon of Tuesday of each week; and
(d) From the 21st day of August, 1977 to the 27th day of August, 1977; and from the 4 th day of September, 1977 to the 10 th day of September, 1977, all dates inclusive, except from six o'clock in the afternoon of Monday to nine o'clock in the forenoon of Tuesday and from six o'clock in the afternoon of Tuesday to nine o'clock in the forenoon of Wednesday of each week.
(3) No person shall fish for sockeye or pink salmon with commercial trolling gear in the waters described in subsection (1) of this section from the 26th day of June, 1977 to the 17 th day of September, 1977, both dates inclusive, except from Monday to Friday of each week on those days when purse seine fishing is permitted within that area.
2. (1) No person shall fish for sockeye or pink salmon with purse seines in the Convention Waters of the United States of America lying easterly of a straight line drawn from Angeles Point in the State of Washington across Race Rocks to William Head in the Province of British Columbia:
(a) From the 26 th day of June, 1977 to the 13 th day of August, 1977, both dates inclusive; except from five o'clock in the forenoon to half past nine o'clock in the afternoon of Monday and Tuesday of each week; and
(b) From the 14 th day of August, 1977 to the 24 th day of September, 1977, both dates inclusive, except from five o'clock in the forenoon to nine o'clock in the afternoon of Monday and Tuesday of each. week.
(2) No person shall fish for sockeye or pink salmon with reef nets in the waters described in subsection (1) of this section:
(a) From the 26th day of June, 1977 to the 2 nd day of July, 1977; from the 10 th day of July, 1977 to the 16th day of July, 1977; from the 24 th day of July, 1977 to the 30 th day of July, 197.7; and from the 7 th day of August, 1977 to the 13th day of August, 1977, all dates inclusive, except from seven o'clock in the afternoon to half past nine o'clock in the afternoon of Monday, from five o'clock in the forenoon to half past nine o'clock in the afternoon of Tuesday and from five o'clock in the forenoon to seven o'clock in the afternoon of Wednesday of each week; and
(b) From the 3rd day of July, 1977 to the 9 th day of July, 1977; from the 17 th day of July, 1977 to the 23 rd day of July, 1977 ; and from the 31 st day of July, 1977 to the 6th day of August, 1977, all dates inclusive, except from half past ten oclock in the forenoon to half past nine o'clock in the afternoon of Sunday, from five o'clock in the forenoon to half past nine o'clock in the afternoon of Monday, and from five o'clock in the forenoon to half past ten o'clock in the forenoon of Tuesday of each week; and
(c) From the 14th day of August, 1977 to the 20th day of August, 1977; from the 28th day of August, 1977 to the 3 rd day of September, 1977; and from the 11th day of September, 1977 to the 17th day of September, 1977, all dates inclusive, except from half past ten o'clock in the forenoon to nine o'clock in the afternoon
of Sunday, from five o'clock in the forenoon to nine o'clock in the afternoon of Monday, and from five o'clock in the forenoon to half past ten o'clock in the forenoon of Tuesday of each week; and
(d) From the 21st day of August, 1977 to the 27th day of August, 1977; from the 4 th day of September, 1977 to the 10 th day of September, 1977 ; and from the 18 th day of September, 1977 to the 24 th day of September, 1977 , all dates inclusive, except from seven, o'clock in the afternoon to nine o'clock in the afternoon of Monday, from five o'clock in the forenoon to nine o'clock in the afternoon of Tuesday, and from five o'clock in the forenoon to seven o'clock in the afternoon of Wednesday of each week.
(3) No person shall fish for sockeye or pink salmon with gill nets in the waters described in subsection (1) of this section:
(a) From the 26 th day of June, 1977 to the 2 nd day of July, 1977; from the 10 th day of July, 1977 to the 16th day of July, 1977; from the 24th day of July, 1977 to the 30 th day of July, 1977; and from the 7 th day of August, 1977 to the 13 th day of August, 1977, all dates inclusive, except from seven o'clock in the afternoon of Monday to half past nine o'clock in the forenoon of Tuesday and from seven o'clock in the afternoon of Tuesday to half past nine o'clock in the forenoon of Wednesday of each week; and
(b) From the 3 rd day of July, 1977 to the 9 th day of July, 1977; from the 17 th day of July, 1977 to the 23rd day of July, 1977; and from the 31st day of July, 1977 to the 6th day of Augusit, 1977, all dates inclusive, except from seven o'clock in the afternoon of Sunday to half past nine o'clock in the forenoon of Monday, and from seven o'clock in the afternoon of Monday to half past nine o'clock in the forenoon of Tuesday of each week; and
(c) From the 14th day of August, 1977 to the 20th day of August, 1977; from the 28th day of August, 1977 to the 3rd day of September, 1977 ; and from the 11 th day of September, 1977 to the 17 th day of September, 1977, all dates inclusive, except from six o'clock in the afternoon of Sunday to nine o'clock in the forenoon of Monday, and from six o'clock in the afternoon of Monday to nine o'clock in the forenoon of Tuesday of each week; and
(d) From the 21st day of August, 1977 to the 27 th day of August, 1977; from the 4 th day of September, 1977 to the 10 th day of September, 1977; and from the 18th day of September!, 1977 to the 24th day of September, 1977, all dates inclusive, except from six o'clock in the afternoon of Monday to aine o'clock in the forenoon of Tuesday, and from six o'clock in the afternoon of Tuesday to nine o'clock in the forenoon of Wednesday of each week.
3. (1) No person shall fish for sockeye or pink salmon with nets within the described waters of subsection (1) of section 2 lying southerly and easterly of a line projected from Dungeness Light to Smith Island Light to Lawson Reef Lighted Buoy to Northwest Island, thence due east to Fidalgo Island from the 14th day of August, 1977 to the loth day of September, 1977, both dates inclusive, except with nets having mesh not less than 8 inches extension measure at times when fishing by each gear is permitted in State Fishing Area 7.
(2) No person shall fish for sockeye or pink salmon with nets in that portion of the waters described in subsection (1) of section 2 lying northerly and westerly of a straight line drawn from Iwersen's Dock on Point Roberts in the State of Washington to Georgina Point Light at the entrance to Active Pass in the Province of British Columbia from the 28 th day of August, 1977 to the 3rd day of September, 1977, and from the 25 th day of September, 1977 to the 8 th day of October, 1977, all dates inclusive.
(3) No person shall fish for sockeye or pink salmon with nets in that portion of the waters described in subsection (1) of section 2 lying westerly of a straight line drawn true south from the southeast tip of Point Roberts in the State of Washington (otherwise known as Lily Point) to the International Boundary from the 4th day of September, 1977 to the 24th day of September, 1977, both dates inclusive.
4. The foregoing recommended regulations shall not apply to the following United States Convention Waters:
(1) State Fishing Area 7B including Hale Passage and Bellingham Bay and all Convention Waters of Area 7B lying easterly and inside of a line projected from Carter Point on Lummi Island to the most northerly tip of Vendovi Island, thence to Clark Point on Guemes Island following the shoreline to Southeast Point on Guemes Island, thence to March Point on Fidalgo Island, and
(2) State Fishing Areas 6 B and 7 C , and
(3) Preserves previously established by the Director of Fisheries of the State of Washington for the protection of other species of food fish.

All times hereinbefore mentioned shall be Pacific Daylight Saving Time."

## Emergency Orders

In order to provide for adequate racial escapement of Fraser River sockeye and pink salmon and for an equitable share of the season's catch by fishermen of the United States and Canada, the approved regulations as detailed above were later adjusted by the Commission as follows:

June 27, 1977-The Commission announced an emergency order that the regulations as approved by the Commission on June 1, 1977 for the 1977 season for sockeye and pink salmon fishing in United States Convention Waters apply to all citizens without exception. The Commission delayed the scheduled opening 24 hours for the week commencing July 3 in United States Convention Waters to avoid a commercial fishery operation on Independence Day.

July 4, 1977-To provide additional harvest of Early Stuart sockeye, the Commission approved an additional 24 hours fishing in Areas 17, 18 and District No. 1 of Canadian Convention Waters, making a total of two days fishing for the current week.

July 8, 1977-In order to secure escapement of Early Stuart sockeye, the Commission approved not opening any of the Convention Waters easterly of the Bonilla-Tatoosh Line to net fishing at the scheduled times for the week commencing July 10 . District No. 1 and those waters of Areas 17 and 18 easterly of a line from Thrasher' Rock Light to Salamanca Point to East Point and due south to the International Boundary of Canadian Convention Waters were also closed to commercial troll fishing.

July 12, 1977 -In the interest of division of catch and to provide additional harvest of the Early Stuart run, the Commission approved the following regulatory changes: 1. That all United States Convention Waters open for one day of fishing on July 14. 2. That Areas 17, 18 and District No. 1 of Canadian Convention Waters open from 4:00 p.m. July 13 to $8: 00 \mathrm{a} . \mathrm{m}$. July 15.

July 15, 1977-In order to secure escapement of Early Stuart sockeye, the Commission approved not opening any Convention Waters easterly of the Bonilla-Tatoosh Line to net fishing at the scheduled times for the week commencing July 17. District No. 1 and those waters of Areas 17 and 18 easterly of a line from Thrasher. Rock Light to Salamanca Point to East Point and due south to the International Boundary of Canadian Convention Waters would also be closed to commercial troll fishing commencing July 17.

July 18, 1977-In the interest of division of catch, the Commission approved fishing in Areas 17, 18 and District No. 1 of Canadian Convention Waters effective 4:00 p.m. July 20 to 8:00 a.m. July 22.

July: 22, 1977-In the interest of division of catch, the Commission approved a reduction of 24 hours fishing in United States Convention Waters to one day of fishing for the week commencing July 24.

July 29, 1977-The Commission approved the following regulation changes: 1. That Area 20 of Canadian Convention Waters open as scheduled for the week commencing July 31 but for only one day fishing. 2. That United States Convention Waters scheduled opening be advanced 24 hours for one day fishing. 3. That Areas 17, 18 and District No. 1 of Canadian Convention Waters open either July 31. or August 1, with an announcement to be made on July 31 for that week's fishing.

July 31, 1977-In the interest of division of catch, the Commission approved 24 hours fishing in Areas 17, 18 and District No. 1 of Canadian Convention Waters effective 4:00 p.m. August 1.

August 1, 1977-In the interest of division of catch, the Commission approved an additional 24 hours of fishing in Area 20 of Canadian Convention Waters making a total of two days for the week.

August 4, 1977-To provide additional harvest of Quesnel River system runs, the Commission approved 24 hours additional fishing in Areas 17, 18 and District No. 1 of Canadian Convention Waters, effective 8:00 a.m. August 6.

August 5, 1977--In the interest of obtaining additional harvest of the Horsefly River run, the Commission approved the following regulation changes: 1. That United States Convention Waters opening be advanced 24 hours for one day of fishing for the week comencing August 7. 2. That Area 20 of Canadian Convention Waters open 24 hours earlier than scheduled for two days fishing. 3. That Areas 17, 18 and District No. 1 of Canadian Convention Waters not open as scheduled on August 8.

August 8, 1977-In the interest of obtaining additional harvest of the Horsefly River run, the Commission approved the following regulatory changes: 1. That fishing in Area 20 of Canadian Convention Waters be extended 24 hours, making a total of three days for the current week. 2. That United States Convention Waters open for one day fishing on August 9.3. That District No. 1 of Canadian Convention Waters open for 24 hours at 8:00 a.m. August 10.

August 19, 1977-In the interest of division of catch, the Commission approved a delay of 24 hours in the scheduled opening in Area 20 of Canadian Convention Waters, for one day fishing.

August 23, 1977-In the interest of division of catch and the need for additional harvest of the pink salmon run, the Commission approved the following regulation changes: 1. That fishing in United States Convention Waters be extended 24 hours, making a total of three days fishing for the current week. 2. That fishing be extended one day in Area 20 of Canadian Convention Waters, making a total of two days for the week.

August 26, 1977-In the interest of securing escapement of pink salmon into Georgia Strait and to allow harvest of sockeye in Canadian Convention Waters, the Commission approved the following regulations: 1. That United States Convention Waters and Area 20 of Canadian Convention Waters not open as scheduled for the week commencing August 28. 2. That District No. 1 of Canadian Convention Waters easterly of the Brunswick Cannery-Oak Street Bridge line open for fishing from 7:00 a.m. to 7:00 p.m. August 29.

August 29, 1977-In the interest of division of catch and to provide additional harvest of pink salmon stocks, the Commission approved the following regulatory changes: 1. That United States Convention Waters open August 29 for two days fishing. 2. That fishing in Area 20 of Canadian Convention Waters open for two days fishing commencing August 31. 3. That District No. 1 of Canadian Convention Waters west of the Apex Line open for 24 hours fishing at 8:00 a.m. August 31. 4. That the waters of Areas 17 and 18 of Canadian Convention Waters, except in the scheduled closed portions, open for 24 hours at 8:00 a.m. August 31.

August 30, 1977-Due to the oil spill in the Fraser River, the Commission approved the following regulatory changes: 1. That the opening on August 31 in District No. 1 of Canadian Convention Waters be cancelled. 2. That United States Convention Waters westerly of the Lily Point line be closed effective 9:00 p.m. August 30 .

September 2, 1977-In the interest of the harvest of the pink salmon run, the Commission approved the following regulation changes: 1. That United States Convention Waters open as scheduled but for one day only. 2. That the scheduled opening in a portion of Areas 17 and 18 of Canadian Convention Waters be delayed 24 hours to 8:00 a.m. September 6. 3. That the waters in District No. 1 of Canadian Convention Waters easterly of the Brunswick Cannery-Oak Street Bridge line open for 12 hours fishing at 8:00 a.m. September 6 and that the waters westerily of the Apex Line open 8:00 a.m. September 6 for 24 hours fishing.

September 7, 1977-In the interest of division of catch, the Commission approved an additional 24 hours fishing westerly of the Apex Line in District No. 1 of Canadian Convention Waters starting 8:00 a.m. September 8.

September 9, 1977-In the interest of division of catch and because of the declining numbers of pink salmon in Juan de Fuca Strait, the Commission approved the following regulatory changes: 1. That control of Area 20 of Canadian Convention Waters and Areas 4B, 5 and 6C of United States Convention Waters be relinquished effective 12:01 a.m. September 11, one week earlier than scheduled. 2. That Areas 6, 6A, 7 and 7A of United States Convention Waters be closed until further notice.

September 13, 1977-In the interest of division of pink salmon catch and harvest of sockeye, the Commission approved an additional 24 hours fishing westerly of the Apex Line in District No. 1 of Canadian Convention Waters, effective 8:00 a.m. September 14.

September 15, 1977-In the interest of division of pink salmon catch and harvest of Weaver Creek sockeye, the Commission approved the following regulation changes: 1. That Areas 6, 6A, 7 and 7A of United States Convention Waters open for one day of fishing on September 16, with the waters westerly of the Lily Point line closed. 2. That United States Convention Waters and Canadian Convention Waters still under Commission control not open as scheduled for the week commencing September 18.

September 19, 1977-In the interest of division of catch and the declining numbers of pink salmon in United States Convention Waters, the Commission approved the following regulatory changes: 1 . That District No. 1 of Canadian Convention Waters westerly of the Apex Line open for 24 hours, effective 8:00 a.m. September 21. 2. That control of Areas 6, 6A, 7 and that portion of 7A easterly of the Lily Point line of United States Convention Waters be relinquished effective 12:01 a.m. September 20. 3. That the waters westerly of the Lily Point line in United States Convention Waters remain closed.

October 3, 1977--In the interest of additional harvest of Weaver Creek sockeye, the Commission approved fishing from 8:00 a.m. to 7:00 p.m. October 5 in District No. 1 of Canadian Convention Waters lying easterly of the Brunswick Cannery-Oak Street Bridge line.

October 7, 1977-Due to the declining abundance of sockeye and pink salmon, the Commission relinquished regulatory control of the remaining Convention Waters still in the Commission's control effective October 9 as scheduled, thus completing the Commission's regulatory obligations for Convention Waters for the 1977 season.

## SOCKEYE SALMON REPORT

## The Fishery

The total 1977 Fraser River sockeye run was estimated at $5,781,000$ compared with a preseason forecast of $7,000,000$. The number of Fraser sockeye entering Convention Waters was $5,018,000$ of which $3,658,000$ ( $72.9 \%$ ) were caught commercially, $246,528(4.9 \%)$ were taken by the Indian food fishery, and $1,113,453$ ( $22.2 \%$ ) were recorded on the spawning grounds (see Tables I to VI in Appendix). An estimated 103,000 non-Fraser sockeye, mainly from the run to

Cedar River in Washington State, were also caught in Convention Waters. The estimated catches of Fraser River sockeye in non-Convention Waters in Johnstone Strait and northern Strait of Georgia and coastal waters north of Convention Waters, were 72S,000 and 35,000 respectively. The non-Convention Waters catch of Fraser sockeye migrating through Johnstone Strait was $12.6 \%$ of the total run, compared with $4.8 \%$ in 1973, the preceding cycle year. The total commercial catch of Fraser River sockeye in non-Convention Waters fisheries in 1977 was $13.2 \%$ of the total Fraser sockeye run, compared with $5.9 \%$ in 1973.

The total 1977 Convention Waters catch of $3,760,762$ was $1,445,789$ smaller than in the brood year and the total Fraser sockeye run was $1,097,000$ smaller. In the Convention area, Canadian fishermen caught 1,971,153 (52.41\%) and United States fishermen caught $1,789,609$ ( $47.59 \%$ ) (Appendix Tables I and II).

In Canadian Convention Waters, 657,725 (33.4\%) sockeye were taken in the waters westerly of William Head while $1,313,428$ ( $66.6 \%$ ) sockeye were caught easterly of William Head mainly near or in the Fraser River. The total catch and percentage made in the western area was the lowest on the cycle since 1965 when $173,860(16.7 \%)$ sockeye were taken. The percentage and catch by purse seines $(22.74 \%, 448,214)$ was considerably below the brood year ( $43.67 \%$, $1,126,314$ ) but only slightly below the average of cycle years 1961-1973 ( $24.56 \%$, 476,325 ). The total gill net catch of $1,487,900$ was the largest on the cycle since 1941 and the catch of $1,295,440$ in District 1 was the largest for any year since 1958.

In United States Convention Waters, the purse seine catch $(822,995)$ was the smallest on the cycle since 1965 and percentage ( $45.99 \%$ ) was the lowest ever. The percentage caught by gill nets ( $50.28 \%$ ) was the largest recorded for this gear although total catch in $1977(899,757)$ was below the brood year catch of $1,075,698$ fish. Reef nets caught 65,984 sockeye in 1977, the lowest catch on the cycle since 1965 and the percentage ( $3.67 \%$ ) was the lowest ever on the cycle.

Fishing effort in United States Convention Waters showed a significant increase compared to previous cycle years (Table 4).

Table 4. United States Convention Waters maximum daily gear deliveries near peak of run.

| Year | Purse Seines | Gill Nets | Reef Nets | Total |
| :---: | :---: | :---: | :---: | :---: |
| 1965 | 153 | 432 | 55 | 640 |
| 1969 | 183 | 519 | 44 | 746 |
| 1973 | 151 | 725 | 48 | 924 |
| 1977 | 212 | 1,021 | 53 | 1,286 |

The increased numbers of fishing gear in 1977 associated with smaller run size and additional fishing days granted by the United States Government outside

Commission regulations, resulted ini only 11 days fishing under Commission regulations during the period June 27-August 16 compared with 22 days fishing in 1973 from June 25-August 15.

In Canadian Convention Waters, there was a reduction in the total amount of fishing effort operating near the peak of the run compared to previous cycle years (Table 5).

Table 5. Canadian Convention Waters maximum daily gear deliveries near peak of run.

| Year | Purse Seines | Gill Nets | Total |
| :---: | :---: | :---: | :---: |
| 1965 | 67 | 1,211 | 1,278 |
| 1969 | 89 | 1,082 | 1,171 |
| 1973 | 129 | 1,178 | 1,307 |
| 1977 | 110 | 980 | 1,090 |

The total catch of sockeye by Indians in United States Convention Waters under United States Government regulations was approximately 196,000. In total, Indians had 31 fishing periods in State Areas 7 and 7 A and 39 fishing periods in State Area 4B. The all-citizen fishery had 18 fishing periods. The total Indian catch made outside Commission regulations was about $11 \%$ of the total United States season's catch.

The major portion of the return in 1977 was composed of Early Stuart, Horsefly and Late Stuart sockeye. In the brood year (1973) these three races comprised $66.9 \%$ of the total return compared with an estimated $71.1 \%$ in 1977. The Early Stuart run in 1977, estimated at $1,333,000$, was about the same size as in 1973 ( $1,367,000$ ). These returns were possibly the largest ever to the system. The 1977 Horsefly-Mitchell River runs were the largest since 1917, totaling an estimated $2,167,000$ sockeye compared with $1,627,000$ in the brood year. For unknown reasons, the 1977 Late Stuart run return was only an estimated 608,000 fish compared with a return of $1,607,000$ in 1973. Total effective female spawners for the respective brood years was almost identical (116,702 and 114,300). The decline in the Late Stuart race had a major impact on total sockeye catch in Convention Waters. Within the Late Stuart spawning areas, it appears that production from the Tachie River and Kuskwa Creek populations was disproportionately low in 1977.

Rates of production for different races were quite variable in 1977. Early Stuart, Horsefly and Scotch Creek runs had high rates of return, whereas Late Stuart, Chilko, Stellako, Raft and Birkenhead River runs had low rates of return.

The average weight of 4 -year-old sockeye was 6.09 pounds, above the long term cycle average of 5.65 pounds. The increased production of the large Weaver Creek sockeye resulting from the spawning channel was again evident. The long term (1917-1977) cycle average weight of 4-year-old sockeye from August 4-

September 1 when Weaver Creek sockeye are present, has been 5.75 pounds. In 1977 during this time period, the average weight was 6.49 pounds, the highest of any year on the cycle.

## Escapement

The net escapement of $1,113,453$ sockeye represented $22.2 \%$ of the 1977 Fraser run to Convention Waters and $19.3 \%$ of the calculated total Fraser River run. The total escapement was slightly below the brood year level and was characterized by excellent escapements into some systems but less than desirable numbers of spawners in other areas.

The escapement of 118,017 Early Stuart sockeye was disappointing when compared to the total of 300,653 recorded in 1973. Although the number of days of fishing authorized by the Commission in 1977 was greatly reduced compared to 1973 (18 and 10 respectively), and run size was about equal for the two years, the total escapement arriving at the spawning grounds was reduced to just slightly better than the 1969 level. The escapement objective was 400,000 Early Stuart sockeye past the commercial fishing boundary at Mission. Echo sounding and test fishing in the Fraser River indicated that about 300,000 Early Stuart sockeye escaped past Mission. The estimated 102,000 Early Stuart sockeye taken on extra days of fishing authorized by the United States, would have been additive to the gross escapement to the Fraser River. The substantial unreported catches of sockeye in the lower Fraser commercial area also are believed to have been made largely from the Early Stuart run. The end result of excessive fishing was that the escapement was only a little more than one-third as large as in the brood year. All of the individual spawning creeks had escapements below the brood year level.

The Bowron River escapement of 2,500 was just slightly more than half as large as in 1973. The Early Nadina race continued to decline to the lowest level on the cycle since 1945. Even though the spawning channel was available for the Late Nadina run starting in 1973, the total escapement of 16,896 was only 159 larger than in the brood year. The Stellako escapement was down 7,303 fish from the brood year level and was the lowest number on the cycle since 1945. The Stellako and Early Nadina escapements were down by $23.8 \%$ and $46.3 \%$ compared with the brood year, whereas the spawning channel-assisted Late Nadina run showed a slight increase in escapement.

The escapements to Upper Pitt River, Seymour River and Scotch Creek were larger than the brood year escapements, with the latter two races more than twice as large as in 1973. The Scotch Creek escapement of 13,586 was the largest yet recorded. The Gates Creek run also showed significant improvement and was more than three times larger than in 1973, and the largest on record for the cycle. Other races migrating at the same time, such as Raft River and Chilko sockeye, had escapements below the brood year level. The decrease at Chilko was not significant but the Raft run continued to show a precipitous decline on this cycle, reaching the lowest number since 1941.

The most dramatic increase in escapement occurred at Horsefly and Mitchell Rivers where 515,000 returned, compared with 278,000 in 1973 . This was the largest escapement since 1913. A most significant aspect of the Horsefly escapement was the spawning of about 75,000 sockeye in the lower areas of the river near Horsefly, where early reports indicate large numbers of sockeye spawned.

While the Horsefly escapement increased by 237,000 in 1977 compared to 1973, the Late Stuart population migrating at the same time declined by 68,000 fish from 214,343 in 1973 to 146,629 in 1977. The 1977 escapement was the lowest on the cycle since 1945. The most noticeable decrease occurred at Kuskwa Creek and Tachie River where escapement levels were down $55.1 \%$ and $44.3 \%$ respectively from brood year levels. The Middle River poptulation $(80,420)$ was down 11,459 fish, or only a $12.5 \%$ reduction. If a large Horsefly escapement had not been obtained, the Late Stuart population would have been even smaller.

The Birkenhead River escapement declined significantly from 139,295 in 1973 to only 43,139 in 1977, and was the lowest on the cycle since 1965.

Late run escapements to Harrison River and Cultus Lake were below those recorded in 1973. The escapement of 55,145 sockeye to Weaver Creek increased by about 5,000 compared to 1973 . The 33,040 sockeye spawning in the channel was the largest number to date. However, a disastrous flood early in November will greatly reduce fry production in the spring of 1978 from both the creek and channel. For several hours a $\log$ jam on the highway bridge forced the flow of Weaver Creek over the dyke protecting the channel, causing severe silting of the gravel bed.

The escapements to Portage Creek, Lower Shuswap River and Adams River were all considerably larger than in 1973. The Lower Shuswap River escapement has increased from only 583 in 1965 to 14,695 in 1977, the largest escapement on record for this cycle. The Portage Creek escapement of almost 8,000 was the largest on record for the cycle.

Success of spawning was good in all areas except at Horsefly River ( $61.8 \%$ ), Mitchell River ( $63.8 \%$ ), Gates Creek ( $75.1 \%$ ) and Chilko River ( $68.7 \%$ ). For the entire escapement to all areas, success of spawning was $73.5 \%$. The continued problem in the Quesnel area was discouraging, but total egg deposition there was the largest since 1913.

Echo sounders were used again to estimate the daily sockeye escapements at two sites in the lower Fraser River. The data from the two sites and from test fishing did not agree during portions of the sockeye migration. Although the total adult sockeye escapement estimate was only $7 \%$ lower than the spawning ground and Indian fishery catch total, major discrepancies existed in the estimation of the escapement of individual stocks. Racial analysis was implicated, as were estimation procedures in the echo sounding program.

The Indian subsistence catch of 246,528 was the largest on record for the cycle and was about 84,000 larger than in 1973. The Commission is becoming increasingly concerned about the continued growth in the catch of the Indian food fishery along the Fraser River. In addition to the reported catches, there are unreported catches by illegal fishing for which no estimate can be made. It is common knowledge that substantial quantities of these salmon are sold to the public. The Commission has to take these circumstances into consideration in managing the commercial fisheries and setting escapement goals past the commercial fishing boundary at Mission. Substantial reduction in fishing time has occurred in the commercial net fishing areas in both countries during the past twenty years. The number of Indian fishing permits has doubled in the last twenty years but corresponding reduction in fishing time has not taken place in the Fraser River Indian food fishery.

## PINK SALMON REPORT

## The Fishery

The total 1977 Fraser River pink salmon run was estimated at $8,173,000$, about $3,773,000$ larger than the predicted $4,400,000$ return. The run was $2,173,000$ larger than the average run size of $6,000,000$ recorded from 1959 through 1975 .

The marine survival of fry produced by the 1975 brood spawning was $2.9 \%$ (Table 6), or the same as the average survival rate of $2.9 \%$ recorded for the previous seven brood years (1961-1973). The total number of pink salmon in 1977 was above the average return due to the large number of fry which migrated to sea in the spring of $1976(279,000,000)$. This was the third largest fry migration since 1962.

Table 6. Fraser River pink salmon production. (Fry production data not available prior to 1961.)

|  | Brood Year |  |  |  |  |  |  |  |  |  |

The total number of pink salmon entering Convention Waters in 1977 was estimated to be $7,565,000$ fish (Table 7) compared to $4,363,000$ in the brood year. Fraser River pink salmon formed $80.2 \%$ of the total pink salmon run reaching Convention Waters, compared to $83.7 \%$ in 1975. The harvest of 484,231 United States pink salmon in Convention Waters constituted $35.4 \%$ of the United States run to Convention Waters, whereas $60.2 \%$ of the Fraser run to Convention Waters was harvested in the commercial fisheries. Closures in certain areas of Convention Waters and reduced number of days fishing were regulatory methods employed in response to a request by the State of Washington to afford maximum protection to their various stocks of pink salmon migrating through Convention Waters. The preseason prediction by the State was for a total return well below escapement requirements.

Table 7. Calculated catches and percentage harvest from pink salmon runs entering Convention Waters in 1977.

|  | Source of Run |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | United States | Fraser River | Canada Non-Fraser | Total |
| Total Entering Convention Area | 1,369,423 | 6,065,688 | 130,304 | 7,565,415 |
| Catch in Canadian Convention Waters |  |  |  |  |
| Westerly of William Head | 421,144 | 1,313,949 | 39,476 | 1,774,569 |
| Easterly of William Head | - | 296,518 | 4,391 | 300,009 |
| Total | 421,144 | 1,610,467 | 43,867 | 2,075,478 |
| Percent Harvest | 30.75 | 26.55 |  |  |
| Catch in United States Convention Waters | 63,087 | 2,038,554 | 66,789 | 2,168,430 |
| Percent Harvest | 4.61 | 33.61 |  |  |
| Total Catch in Convention Area | 484,231 | 3,649,021 | 110,656 | 4,243,908 |
| Percent Harvest | 35.36 | 60.16 |  |  |

The 1977 catch in Convention Waters was $4,243,908$ compared with $2,509,045$ in 1975 (Appendix Table XI). The division of catch was Canada 2,075,478 pinks ( $48.90 \%$ ), and the United States 2,168,430 (51.10\%).

The outstanding feature of the fishery was the catch distribution by gear within the Canadian fishery. Troll fishermen caught 987,610 pink salmon in all Convention Waters, amounting to $47.59 \%$ of the total Canadian catch. The catch and percentage were the highest yet recorded, exceeding the 975,268 recorded in 1967 and $25.29 \%$ in 1969. Although the total catch made in 1977 by trollers was only 12,342 larger than in 1967 , the timing of the catch and its proportion of the total run was distinctive.

The catch in 1977 by trollers was made early in the season compared with 1967. As of August 1, 1967, only $11.7 \%$ of the season's total troll catch in Convention Waters had been landed, whereas in 1977 by the same date $34.2 \%$ of the season's total catch had been taken. Trollers in 1967 had taken $53.0 \%$ of the total catch by all gear by August 15, whereas in 1977 the troll catch to the same date formed $67.9 \%$ of the total catch. The large early season troll catch created a serious early season division problem before the run reached United States Convention Waters. On August 21 the Canadian total catch of pink salmon was estimated at $1,207,000$, and for the United States only 284,000 . A division difference of this magnitude had never before been encountered, and the season's total predicted catch by Canada had been exceeded before run size had been determined and before net fishermen had an opportunity to fish.

The estimated total West Coast catch by trollers of Fraser pinks by fishermen of both countries in all areas in 1967 formed $14.0 \%$ of the total Fraser run, and in 1977 the catch by trollers increased to about $21.4 \%$ of the Fraser run.

The percentage of the total catch made by purse seines declined from $50.88 \%$ in 1975 to only $38.89 \%$ in 1977. The percentage taken in 1977 was the lowest since 1969 , when only $32.23 \%$ was taken by seiners. Gill nets in 1977 took only $13.52 \%$ of the total catch, down from the $29.98 \%$ taken in 1975 , and the percentage for 1977 was the lowest on record.

Catch distribution of pink salmon in Canadian Convention Waters showed that about one-half ( $47.3 \%$ ) of the total catch was made before the fish reached the net fishing area. In 1969, which was the previous high year, $24.8 \%$ of the catch was made in the outside fishery. The long term average removed by the troll fishery from 1957-1975 was $16.0 \%$. The unprecedented high percentage recorded in 1977 emphasizes the effect of the troll fishery on the catch in the net fishing area. The percentage of the Convention Waters catch taken in Area 20 $(38.2 \%)$ was the lowest since 1947 when the fishing capabilities of the area were just being developed. From 1957 to 1975 the Area 20 fishery had taken, on the average, $61.3 \%$ of the season's annual catch. The District 1 catch of only 262,196 pinks was the lowest since 1969 and percentage ( $12.6 \%$ ) the lowest since 1963.

In United States Convention Waters, purse seines caught $82.49 \%$ of the total catch, the highest percentage since 1967 when $83.71 \%$ were taken. Gill nets caught $9.15 \%$, the lowest since 1969 . The reef net catch of only 30,069 was the lowest catch since 1965 and percentage ( $1.40 \%$ ) was the lowest since 1935, the first year of records. The troll catch of 163,416 was the best since 1967 and the percentage of $7.54 \%$ was the largest since 1965 .

## Escapement

The total 1977 escapement of pink salmon to the Fraser River was 2,387,811 fish (Appendix Table XIV), or about $29.2 \%$ of the total run. Of the total run reaching Convention Waters $(6,066,000), 39.4 \%$ arrived at the spawning grounds. The total escapement in 1977 was over one million larger than in the brood year and was the largest since 1957.

The total Early run escapement of 2,195,769 was the largest thus far under Commission management. It exceeded the previous maximum recorded in 1957 by about 584,000 fish. Not only was the increase in numbers of spawners encouraging, the distribution of the escapement was also favorable. The total escapement above Hell's Gate of $1,417,000$ was the best on record, approximately 650,000 higher than in 1975 and most likely the largest since 1913. The Thompson River escapement of 972,941 was more than double the 1975 total of 480,350 which had been the largest on record since 1945 when the Hell's Gate fishways were completed. There still was room for many more spawners based on field observations. Pink salmon were observed spawning in the North and South Thompson Rivers, Little River, Adams River and even in the Lower Shuswap River. Early historical records indicate similar widespread distribution of pink salmon. The Seton Creek escapement of 389,541 fish was also the largest on record. Both spawning channels were filled to capacity with combined totals exceeding any year to date. The escapement of 19,904 pinks into Portage Creek. in 1977 was almost 10,000 less than in 1975. A very significant improvement occurred in the numbers of fish utilizing the vast main Fraser River area. In 1975 there were only 315,049 spawners in this area, and in 1977 the total was 775,016 . However, this number is still considerably below the $1,264,000$ spawners in 1957.

The effect of the severe flooding in the fall of 1975 was evident in the Late run escapements. Despite reduced fishing effort on the Late runs, the total escapement of 183,796 Late run pinks was the poorest recorded since 1957. The Chilliwack-Vedder River escapement of only 48,561 fish was down $40.2 \%$ compared with 1975. This decline was expected because of the flood in that river in 1975. However, the $29: 6 \%$ reduction in the Harrison River escapement was unexpected.

The total Late run escapement in 1977 constituted the lowest percentage ( $7.7 \%$ ) of the total Fraser River's escapement since 1957. During the period 1957 through 1975, the Late run escapement averaged $25.2 \%$ of the total annual escapement. It is quite apparent that a much larger Fraser River pink salmon run would have resulted in 1977 had the Late run contributed a normal share of seaward migrating fry, since the brood year percentage of the total escapement, $20.4 \%$ ( $279,000 \mathrm{fish}$ ), was adequate to have added substantial numbers of pinks to the return.

The estimated rate of return per spawner for Early run pinks in 1977 was 6.71 while the Late run was only 2.28. If the Late run spawners in 1975 had experienced an equivalent rate of return compared with the Early run, an estimated additional $1,237,000$ Late run pinks would have been produced. It is unfortunate that construction of the pink salmon spawning channel on the Chilliwack River was not approved by the Canadian Government, as this facility would have offset some of the adverse effects of the flood.

Spawning conditions in all areas were good in 1977 except for a flood at Weaver Creek and Chehalis River on November 1.

Field observations in 1977 and the analysis contained in the Commission's 1971 Annual Report indicate that, with proper distribution of spawners, much larger escapements than those recorded in 1957 and in 1977 would be desirable.

Echo sounders were also used for the first time to estimate the daily pink salmon escapements at two sites in the lower Fraser River. The pink salmon escapement estimate was about $20 \%$ low, apparently due to the same problems affecting the sockeye estimate. The lack of accuracy suggests that basic procedures in the echo sounding program require examination and improvement.

A reduction in fishing time in certain Convention Waters net fishing areas associated with extensive closures to fishing during specified time periods (West Beach), contributed in part to greatly increased escapements into a few Washington State streams (Appendix Table XV) in 1977 compared with 1975 levels.

## SPAWNING CHANNEL OPERATIONS

Fry production from the 1976 spawning of sockeye at channels operated by the Commission is given in Table 8.

Table 8. Sockeye fry production at spawning and incubation channels from the 1976 brood year spawning.

| Site | Eqgs <br> Deposited | Fry <br> Produced | Percent <br> Survival |
| :--- | :---: | :---: | :---: |
| Upper Pitt | $4,648,000$ | $3,861,000$ | 83.1 |
| Weaver Creek | $65,059,000$ | $52,753,000$ | 81.0 |
| Gates Creek | $26,177,000^{*}$ | $17,533,000^{* *}$ | 67.0 |
| Nadina River | $2,413,000$ | $1,593,000$ | 66.0 |

* Includes 318,000 eggs planted from moribund females.
** Includes 251,400 fry from the planted eggs.
At the Nadina River channel an additional 4,127,000 eggs were tranferred from the Stellako River and planted green in the upper portion of the channel in an area from which the small population of spawners had been excluded. These eggs produced 717,000 fry, which is a survival of only $17.4 \%$. The poor survival of this plant is believed to have been the result of planting procedure. The number of fry from the Weaver channel is over three times more than from the previous cycle and is the largest number produced on any year to date. The density of spawners in the channel in 1976 ( 0.9 females per sq yd) was the highest of any year, and there is no indication of any density effect on fry output up to this density. Fry production from the Gates Creek channel was nearly three times more than for the previous cycle and was the largest of any year.

The total Pitt River run in 1977 was estimated at 75,783 sockeye, of which 32,871 were produced by the channel (Figure 1). The small run is partly attributable to the low fry production in 1973, the brood year for the four year old fish. The total Weaver Creek adult run in 1977 was estimated at 334,642 sockeye, of

FIGURE 1-Sockeye production from Pitt River and Pitt River incubation channel.
which 301,817 were produced by the channel (Figures 2, 3). The percentage survival from eggs to adults for both the creek and channel was next to the lowest since 1965. Despite this, this was the second largest return from the channel, the highest being in the brood year 1973. The total Gates Creek run in 1977 was estimated at 11,184 , of which 10,748 were produced by the channel. This run was nearly three times larger than in the brood year and is a significant gain for this off year. The first returns from the Nadina River channel were obtained in 1977 from the brood year spawning in 1973. The Late Nadina adult run was estimated at 79,101 sockeye, of which $77.6 \%$ or 61,382 were produced by the channel. This was the dominant cycle for Late Nadina, and the run was the smallest on the cycle since start of records in 1953.

The 1977 egg take of $4,909,000$ for the Pitt River incubation channel was the largest yet obtained. At Weaver Creek, the number of sockeye spawners was increased to 33,040 , the largest number yet obtained and 1.5 times more than in the brood year. This increase was made to obtain a higher density of spawners than in previous years to provide further information on the effect of density of spawners on fry output. However, a flash flood on November 1 resulted in a large $\log$ jam on the public road bridge adjacent to the channel, which raised the creek level, causing a large flow of muddy water and debris across most of the spawning channel site. Spawning was almost finished at the time and there was little, if any, loss of eggs from the channel. However, substantial amounts of silt were deposited in the channel and it is anticipated the survival rate of the eggs will be substantially below normal for the channel.

At Gates Creek channel, the number of spawners increased from 668 in 1973 to 1713 in 1977. The escapement of 2889 sockeye to the Gates Creek system was the largest yet recorded on this cycle, and reflects the combined effects of

FIGURE 2-Sockeye production from Weaver Creek and Weaver Creek channel.

FIGURE 3-Number of adult sockeye produced from spawning in Weaver Creek spawning channel compared to the number produced by natural spawning in the creek, by cycle years.
improved production attributable to the channel and improved passage of the run at the Seton Creek powerhouse tailrace in 1977.

At the Nadina River channel, the number of spawners increased from 8786 in 1973 to 16,286 in 1977. Much of the increased escapement was obtained from the river population which decreased from 7951 in 1973 to 610 in 1977. The fish selected the spawning channel in 1977, whereas in 1973 considerable effort was needed to put fish into the channel.

A detailed report (Progress Report 36) on the channels and the benefits they have produced to fishermen was published during 1977.

## REHABILITATION

As mentioned in previous Annual Reports, the scope of work in rehabilitation has been curtailed because of lack of agreement between the two countries in funding the Commission's development program recommended in 1972.

The 1975 transplant of Seymour River sockeye eggs to the Upper Adams River, in distinct contrast to the 1974 transplant, apparently did not result in any sockeye migration from Adams Lake in 1977. Only one smolt was observed during the normal spring period for such immigration. No jacks were seen at Upper Adams River in the fall of 1977 as forerunners of the anticipated return from the 1974 transplant. The return of four year old adults in 1978 now must be awaited as the final measure of success of this transplant, which was a follow-up of earlier attempts to replace the extinct Upper Adams sockeye run.

## RESEARCH

Research into the lacustrine biology of sockeye was conducted in the lakes throughout the Fraser system with emphasis on Cultus and Shuswap Lakes. Sockeye abundance, distribution, growth and plankton standing crop, species composition and other limnological parameters such as water temperature, clarity and conductivity were examined.

The 1977 plankton standing crop in all the major sockeye rearing lakes remained at a level considered stable for this cycle. Four lakes, Chilko, Fraser, Harrison and Pitt, had sockeye escapements of considerable size in 1976. The increase in the 1977 standing crop at Chilko and the decrease at Harrison compared to 1973 data was consistent with the relative size of the 1976 spawning population (Table 9).

Both Fraser and Pitt Lakes indicate an increase in the 1977 standing crop when compared with 1973, and yet both had an increase in the number of effective spawners. These data indicate a general increase in zooplankton production over the levels of 1973.

Table 9. Mean standing crop and number of effective female spawners as an index to number of fry present in residence year.

| Lake | Mean Standing Crop (c.c.) |  | No. Effective | Female Spazeners |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | 1973 | 1977 |  | 1972 | 1976 |
| Fraser | 2.05 | 2.65 |  | 19,900 | 63,900 |
| Chilko | 0.49 | 0.54 |  | 333,300 | 211,600 |
| Harrison | 0.33 | 0.21 |  | 41,200 | 78,300 |
| Pitt | 0.12 | 0.15 |  | 5,400 | 18,200 |

The standing crop of plankton in Shuswap for 1977 was approximately 3 times that of 1973 and second only in the cycle to the level recorded for 1961 (Figure 4). The data suggest an overall periodicity of zooplankton abundance, with superimposed annual variations as a result of cropping by sockeye.

FIGURE 4-Average plankton volumes at Sorrento, Shuswap Lake, showing years of lake residence of fry.

An examination of species composition of plankton at Shuswap indicates that with large sockeye populations, the percentage of cladocerans in the zooplankton population is decreased (Table 10). The very low plankton standing crop in 1971 (Figure 4) would have presented a less than favourable food situation for sockeye and may have contributed to the relatively small size ( 3.50 gm ) of the Shuswap smolts in 1972. The standing crops of zooplankton have recovered from the low levels from 1968-1975, and the major spawning populations in 1970 and 1974 did not have lasting effects on the zooplankton levels in Shuswap Lake.

Table 10. Average percentage of cladocerans and copepods present at Sicamous and Sorrento stations of Shuswap Lake.

|  | Percent Cladocerans |  |  | Percent Copepods |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

| $1971^{*}$ | 4.62 | 7.50 | 95.38 | 92.50 |  |
| 1974 | 20.99 | 22.11 | 79.01 | 77.89 |  |
| $1975^{*}$ | 10.22 | 17.22 | 89.78 | 82.78 |  |
| 1976 | 17.23 | 22.08 | 82.77 | 77.92 |  |

* Year of dominant cycle residence.

The sockeye feeding behaviour study started in 1976 at Cultus Lake continued in 1977. Acoustic surveys located sockeye during feeding, and trawl and plankton samples were collected simultaneously. A comparison was then made with the plankton sample and the gut content of the sockeye. The fry appeared to be selecting the cladocerans Daphnia and Bosmina and at times Leptodora. Calonoids and cyclopoids were taken in small amounts or not at all during these sample times (Table 11). The fry also appeared to select for adult organisms over immature forms (Table 12).

Table 11. Comparison of relative abundance in plankton sample with relative abundance in git of sockeye fry from Cultus Lake.

Acoustic surveys were made of thirteen sockeye rearing lakes in the Fraser system, with only Chilko and Lillooet Lakes not strveyed. Population estimates were made for each lake, but further analysis is required to separate the kokanee. The method used had limitations where high densities of fish occurred, such as in Harrison, Pitt and Cultus Lakes. This limitation will be overcome by improved equipment for data collection and analysis.

Prespawning mortality had a major impact on the dominant Horsefly run with a loss of $40.3 \%$ of the female sockeye prior to spawning (Table 13). In spite of this, the number of effective female spawners was increased substantially over the brood year, and was the largest since 1913.

Table 13. Comparison of Horsefly-McKinley female sockeye population, 1969, 1973 and 1977.

|  | Female <br> Date | Percent <br> Mortality | Effective <br> Females |
| :---: | :---: | :---: | :---: |
| 1969 | 158,333 | 52.0 | 75,964 |
| 1973 | 139,579 | 27.5 | 101,231 |
| 1977 | 246,989 | 40.3 | 147,378 |

A study on the possible causes of the mortalities was carried out by the Fish Health group of the Pacific Biological Station in cooperation with Commission staff. There was no obvious difference in the microbiology of the fish examined compared to previous cycles. There was, however, an extremely heavy sporozoan parasitic infection in the kidney of the moribund fish which was not detected in previous cycles, and the virus IHN was found in a low percentage of samples examined.

Studies of possible methods of alleviating some of the impact of this mortality have been continued. Previous tests have shown that eggs from moribund females could be successfully fertilized. In 1976 approximately 300,000 eggs from moribund Gates Creek females were fertilized and planted in an isolated part of the channel. This group of eggs had an egg to fry survival of $80 \%$. Fry from this
group were raised over summer in 1977 at the Sweltzer Creek Research Station and no differences in quality could be detected when they were compared to control fish. Therefore, in 1977 approximately $6,400,000$ eggs were stripped from moribund Horsefly females. These eggs were fertilized and planted in a previously prepared gravel bed in McKinley Creek at the outlet of McKinley Lake. The gravel in this section is similar to that used in spawning channels. The fry will be enumerated in the spring of 1978.

Four years ago it was reported that the virus Infectious Haematopoietic Necrosis, or IHN, had been isolated from 1972 brood Chilko fry. This was the first known case of IHN in wild fish. In the spring of 1973 the numbers of fry entering Chilko Lake were substantially lower than expected (Figure 5). The 630 million eggs deposited in 1976 should have produced in the vicinity of 45-50 million fry, but enumeration this spring indicates only 15.6 million fry migrated into Chilko Lake. Samples of fry were collected and shipped to Nanaimo Biological Station for processing. All of the fry submitted had active IHN. Therefore it appears that IHN has once again had a serious impact on the Chilko fry production on this cycle. There has been no evidence of IHN in the other cycles since the observation for the 1972 brood stock. In the $1972-76$ cycle, the Chilko run has accounted for more than $60 \%$ of the commercial harvest of Fraser sockeye. Unless some control of the virus can be found, the future of the Chilko run on this cycle is bleak. At present there is no known treatment or preventative measure suitable for use at the spawning grounds and there is urgent need for research to develop a suitable treatment.

The program to investigate the feasibility of producing an even year pink salmon brood stock of Fraser origin continued. The 2000 even year fry being raised at the Sweltzer Creek Research Laboratory grew well and mortality was small until October 1977. At that time a bacterial gill infection, perhaps complicated by dietary deficiencies, resulted in loss of all of these fish.

A second group of pinks taken from the 1975 brood Seton Creek population is presently being raised on a three-year cycle and should reach maturity in the fall of 1978. The zooplankton diet is being supplemented with vitamins and the fish are also receiving periodic prophylactic antibiotic injections to control kidney disease. The overall mortality has been lower in this group and the growth more rapid, which should produce larger and more adult pink salmon in 1978.

Investigations of methods of forecasting the magnitude of Fraser River sockeye and pink salmon runs were continued during 1977. As previously mentioned, the 1977 sockeye run was about 1.2 million fish fewer than predicted, and the pink run was nearly 3.6 million fish more than predicted. The discrepancies in the forecasts based on correlation of environmental factors with survival indicate the need for further analysis of the interrelationships and the need for better understanding of the links between the factors and specific aspects of the salmon's life cycle. It is unlikely that great precision in forecasting can be achieved, but accuracy sufficient for management and industry planning does appear to be practicable.

FIGURE 5 -Chilko fry production compared to egg deposition.

## ENVIRONMENT PROTECTION

Previous Annual Reports have referred to the upgrading of biological effluent treatment facilities at Prince George Pulp and Paper Company and Intercontinental Pulp Company at Prince George. These mills have now extended treatment time to four days or more. The effluents will undergo partial treatment at each mill before combining in an aerated lagoon for the final treatment phase. Effluent will be discharged to the Fraser River through a multiport diffuser used previously only by Prince George Pulp and Paper. Theoretical calculations indicated dilution of the combined effluent through the diffuser, even though modified, would be near the lower limit allowed by provincial objectives. Owing to the limitations of theoretical calculations in this instance, the Commission recommended on-site measurements of diffusion in 1978.

Although a treatment time of four days or more has been successful for kraft mill effluent, sufficient aeration capacity must be maintained when load to the treatment system increases. This was evident at Cariboo Pulp and Paper Limited at Quesnel where the pulp mill experienced a period of substandard treatment. Major refitting and modifications undertaken at the mill lessened load on the treatment system, but not enough to meet aeration capacity. Consequently an additional five aerators are to be installed in the aerated lagoon.

Improvements have been made in waste handling at the Scott Paper Co. Limited groundwood pulp mill and paper plant on the North Arm of the Fraser River in New Westminster, where a program to upgrade pollution control has been underway for the past few years. Recent extension of the municipal sewer system permitted discharge of wastewaters from the groundwood mill to the municipal sewer for treatment at Annacis. Island sewage treatment plant. The remaining wastewater is treated on site before discharge to the Fraser River.

At the Belkin Paperboard Limited wastepaper recycling plant on the North Arm of the Fraser River below New Westminster, the current method of treatment has not been adequate to meet federal regulations or provincial objectives for the effluent. Alternative methods of handling the effluent are under investigation.

The Pollution Control Branch issued a discharge permit for Annacis Island sewage treament plant in 1971, which specified primary treatment, authorized discharge of 129 million imperial gallons per day, set limits on a wide range of substances including toxic materials such as metals, cyanide and phenol, and specified a toxicity limitation equivalent to 1.33 toxic units. Studies by the Commission in cooperation with Environment Canada at four primary treatment plants in the Greater Vancouver area, including Annacis Island, indicated the effluents contained 2.5 to 5 toxic units in the absence of residual chlorine. These data suggest toxicity at the Annacis plant will have to be reduced severalfold to meet specifications in the permit. Based upon experience reported in the technical literature, these permit conditions can be met and substantially improved upon by secondary treatment.

The high toxicity to fish of residual chlorine and the formation of chlorinated organic substances during disinfection of sewage with chlorine has been discussed in previous Annual Reports. Commission investigations in 1975 have shown that the toxicity caused by residual chlorine can be removed by dechlorination before discharge to receiving waters. Dechlorination has been adopted at Annacis Island and Lulu Island sewage treatment plants on the lower Fraser River and adoption of this treatment has been recommended at other plants where chlorination is required.

During 1977, B. C. Hydro and Power Authority and its consultants continued examination of environmental aspects of the proposed Hat Creek thermal power plant. The conceptual design of the mine and generating plant proposed no aqueous discharge to receiving waters, but gaseous emissions would contain oxides of sulfur and nitrogen which may give rise to abnormally acid precipitation.

An ad hoc committee, with representation from the Commission, Environment Canada and other agencies, prepared a review of the acid precipitation phenomenon and its effect on terrestrial and aquatic ecosystems. The review concluded by recommending a monitoring program to include chemical measurements of precipitation and surface waters. The committee concluded from the technical literature that symptoms of acidification would be observed first in small, high altitude lakes. Therefore emphasis was placed on such lakes as important monitoring sites. However, large, moderate and small lakes at lower altitudes, including sockeye rearing lakes, were also recommended for the monitoring program owing to their importance to fishery resources.

Acidification of precipitation is controllable at source by cleansing gaseous emissions and is an option to be considered in design of the combustion facilities at Hat Creek. Such cleansing methods are being used more and more in Canada and the United States.

In the fall of 1977 it was found that the aquatic weed, Eurasian water milfoil (myriophyllum spicatum), was growing in Cultus Lake and near the mouth of Vedder Canal. The weed was also observed in Sweltzer Creek. Eurasian milfoil has previously been found along the shoreline areas of lakes in the Okanagan Valley where its presence has prompted studies of means of control or eradication. Provincial authorities are now considering control of the weed in Cultus Lake also.

Observations by Commission personnel indicate that so far the spawning grounds in Cultus Lake and Sweltzer Creek are not being affected by Eurasian milfoil, although the weed is growing in adjacent areas. The Commission will be examining the situation in Cultus Lake with Fisheries and Marine Service and will conduct research relevant to proposals for controlling Eurasian milfoil to assure sockeye and pink salmon are protected.

A spill of bunker fuel oil from storage tanks into the Fraser River at Steveston occurred during the night of August 29-30. Tide and river currents distributed the oil into Georgia Strait. Aerial inspection revealed that oil had spread to the outer edges of the Fraser River plume by mid afternoon. The oil continued to spread southward into United States Convention Waters and the Commission closed certain fishing areas in both countries temporarily to aroid fishing operations in the affected waters. Fish collected during test fishing were examined for oil contamination but none was evident and there was no off-odor. The oil spill at Steveston was small compared to the amount that could be spilled from a tanker. It is evident that a large spill during the fishing season would pose severe problems for the fishing industry and for management of the runs.

In connection with a ski development at the headwaters of Sakwi Creek, a water quality monitoring program was started in the fall of 1977. Observations have shown that siltation occurred in Sakwi Creek during rainfall. Sampling at the ski area during wet weather showed that turbidity in Sakwi Creek was low
upstream of the developed area but very high downstream. The Commission and the Fisheries and Marine Service participated in an interagency committee to review the site drainage plans, with a view to minimizing potential effects on salmon spawning grounds downstream in Weaver Creek. The fisheries agencies have recommended that expansion plans for the ski area for 1978 be delayed pending correction of siltation problems through implementation of an acceptable drainage plan.

Inspection and photographic records indicated algae growths in the Thompson River in September and October were similar to those observed in previous years by the federal-provincial Thompson River task force. That study attributed discharges of phosphorous from the pulp mill lagoon and municipal sewage stabilization ponds at Kamloops as significant factors in the algae growth. The task force recommended significant reductions in discharge of phosphorous from these two point sources. It was reported in the 1976 Annual Report that phosphorous and nitrogen were no longer being added to the aerated lagoon at the pulp mill, and the City of Kamloops has initiated a program to remove phosphorous from municipal sewage by applying alum to the stabilization ponds.

Subsequent measurements showed phosphorous occurred in the effluent from the pulp mill aerated lagoon owing to inputs from various processes in the mill. At the sewage lagoons, phosphorous was lost to the Thompson River via exfiltration. Methods of upgrading phosphorous removal at the municipal sewage lagoons were under study in 1977.

In a cooperative project with Environment Canada's Inland Waters Directorate, samples from the Fraser River, selected tributaries in the Fraser Valley draining agricultural areas, and municipal sewage were cultured for Flexibacter columnaris, the bacteria which causes columnaris disease among adult sockeye. Samples were collected twice during migration of adult sockeye and were negative except for one sample from the Fraser River at Rosedale.

A survey of dissolved atmospheric gases was conducted in the Fraser, Thompson and Horsefly Rivers, and McKinley Creek during migration of adult sockeye. Total dissolved gas content in the Fraser River between Hope and Lillooet varied between 109 and $113 \%$ on a dry air basis. Total dissolved gas content in the Thompson and Horsefly Rivers and McKinley Creek ranged from slightly above $100 \%$ saturation to slightly below. It was concluded that the combination of supersaturation and duration of exposure experienced by adult sockeye in the rivers tested was less than the lethal threshhold. However, in view of the level of supersaturation in the Fraser River, future developments in the watershed must be examined in light of their possible impact on supersaturation as well as other environmental effects.

As in the past, samples of plankton obtained by Weyerhaeuser Canada from Kamloops Lake were forwarded to the Commission for measurement. This sampling program will be conducted in even years only in the future, as recommended by
the Thompson River task force report. Measurements of turbidity, pH and conductivity of the Fraser River at Hell's Gate were contintued. The program of obtaining baseline water quality data in the Nadina River and tributaries was continued in expectation that logging would commence in 1978.

## ENGINEERING

As a result of the large number of fish returning to the Weaver Creek spawning channel in recent years, it has been found necessary to improve the facilities for diverting fish past the channel so that they can utilize natural spawning areas in Weaver Creek adjacent to, and upstream from, the spawning channel. The spawning channel was designed for sockeye salmon and 5000 sq yd of additional area was provided for chum and pink salmon that were expected to enter the channel along with the sockeye. In recent years, not all of the returns of sockeye, chum and pink salmon could be accommodated in the channel. In 1976, the excess chums were, manually removed, but this was not a satisfactory method. A species sorter was installed in 1977 that enabled all excess spawners to swim out of the lowest leg of the channel and to return to Weaver Creek upstream from the barrier fence at the entrance to the spawning channel. These diverted fish are not removed from the water or handled in any way. Using up to four swing gates, operators are able to direct the fish into an open channel and pipeline through which they swim to reenter Weaver Creek. These facilities handled 9522 fish in 1977 with no operational difficulties. Most of the diverted fish migrated to good spawning areas in Weaver Creek upstream from the Weaver-Sakwi confluence.

Improvements were also made, at the Gates Creek spawning channel in efforts to overcome minor operational problems. During high water, some of the bedload carried by Gates Creek is swept into the intake screen chamber and gravel is also deposited in front of the intake where it interferes with flow into the intake at low water levels. To alleviate these problems, additional intake area was provided and a second gate was installed for sluicing bedload materials past the intake scneen chamber. The barrier fence, which is used for diverting fish out of Gates Creek into the spawning channel, was improved by rechanneling the flow to provide more attractive entrance conditions to direct sockeye toward the spawning channel.

Ice formation in the fishway at the lower end of the Gates Creek spawning channel has caused operational problems during severe weather conditions by partially damming the channel. To alleviate this problem, a branch was installed on the existing pipeline from Anderson Lake so that water pumped from below the thermocline in the lake could be discharged when required at the downstream end of the channel for melting any accumulated ice.

A major maintenance job was required at the Weaver Creek spawning channel for repairing flood damage caused by a flash flood in Sakwi Cneek that occurred on November 1, just prior to the end of the spawning period. HLeavy rains caused severe washouts and slides on the road to a ski area at the headwaters of Sakwi Creek, which is tributary to Weaver Creek upstream from the spawning channel
site. The high discharge in Sakwi Creek brought down a large amount of forest debris which formed a log jam on the highway bridge over Weaver Creek adjaoent to the upper end of the spawning channel. This log jam caused Weaver Creek to flood over the spawning channel for several hours, depositing sand and silt on the gravel over $95 \%$ of the length of the channel. Silt was deposited to depths of up to 12 inches in some areas. The flood also caused extensive bank erosion in Sakwi Creek near the water intake on this stream, and extreme bed erosion and heavy deposition of wood debris, silt, sand and gravel occurred in Weaver Creek between the Sakwi confluence and Morris Lake, a distance of 1.3 miles. The stream bed was raised to such an extent by this deposition that it was considerably higher than the adjacent ground in some areas, with the result that part of the stream bed was dry during the winter low-flow period. Sampling of the stream bed showed that there was practically no survival of eggs below Sakwi Creek. There was no flood damage in Weaver Creek upstream from the Sakwi-Wearer confluence.

All of the repair work required to restore Weaver Creek and the spawning channel to its pre-flood condition could not be completed in 1977 because of the need to avoid damaging the surviving eggs and alevin. Since no spawning had occurred in Sakwi Creek, it was possible to remove log jams, excavate much of the sand and gravel that had been deposited in the creek bed, and construct bank protection to prevent further damage to the Sakwi Creek water intake and silt settling basin. Rock riprap was placed on the bank of Weaver Creek between the Sakwi confluence and the spawning channel to repair erosion damage and to provide greater protection against subsequent floods. An attempt was made to use a suction device for removing sand and silt deposited on the gravel in the spawning channel but this proved to be impractical. After fry emergence, this gravel will be cleaned by using the previously developed spawning channel gravel cleaner. Further work will also be required in Weaver Creek to remove materials deposited in the stream bed and to provide bank protection in some areas.

Counting of sockeye migrating through a fishway over the Seton Creek dam and observations of fish in the tailrace of the Seton Creek hydroelectric plant showed that, as in past years, the migration of adult sockeye at this hydroelectric plant was again delayed. Although there was a loss of Portage Creek sockeye due to delay and injury in the tailrace, the run arriving on the spawning grounds was double the brood year. The power plant was shut down for repairs during migration of the Gates Creek run and the fish arrived in excellent condition. The escapement was 3.6 times as large as the brood year. B. C. Hydro has hired consultants to analyze proposals that have been made for overcoming the delay problem, but none of the possible solutions has yet been agreed to by B. C. Hydro. It has been found that fish delay can be reduced by a combination of plant shutdowns and large spills down Seton Creek, and it will be necessary to continue with this and possibly other measures, pending implementation of permanent remedial measures.

Commission staff spent considerable time in 1977 analyzing and supplying data to B. C. Hydro's consultants to aid in preparation of environmental impact statements for the McGregor River diversion. After the year end, B. C. Hydro announced the project had been shelved. Many discussions were held with B. C. Hydro and its consultants concerning the proposed water intake in Thompson

River for the Hat Creek thermal plant. Approximately $82 \%$ of the pink salmon utilizing Thompson River spawning areas in 1977 spawned upstream from the proposed intake. A report on distribution of spawners in relation to the water intake site was prepared in collaboration with B. C. Hydro. The design of the proposed water intake has been discussed in detail with B. C. Hydro and it is considered that this part of the Hat Creek project will not have an adverse effect on sockeye or pink salmon production.

In cooperation with the Fisheries Service and the Department of Public Works, studies were made to determine the extent of pink salmon spawning in areas of the main stem of the Fraser River where dredging and gravel removal are sometimes required. There was no dredging or gravel removal this year in the 30 -mile-long spawning anea in the Fraser River between Mission and Hope.

Techniques have been developed and tested over the past six years to enable in situ cleaning of spawning gravel in natural spawning aneas and in spawning channels. The 2 -mile-long Nadina spawning channel was cleaned this year prior to the spawning of approximately 16,000 sockeye in the channel. Measurements of the silt content in the other channels showed that only the Nadina channel needed cleaning this year.

Areas of the natural spawning ground in Nadina River that had been cleaned in 1975 and 1976 were surveyed again this year to determine the number of years the benefits of cleaning persist. The objective in cleaning spawning gravels in natural rivers is to produce a spawning medium similar to that provided in artificial spawning channels. This objective has been achieved, but the experiments have shown that because of the large amount of bedload movement, frequent recleaning of this spawning area would be required. After being exposed to two annual floods, one half of the length of the Nadina riverbed cleaned in 1975 has now reverted to the original condition of relatively low permeability. Continuation of cleaning in the Nadina River is considered impractical until there is a substantial increase in the number of Early Nadina spawners, as the few existing spawners are not attracted to the clean gravel and only random use is made of the clean gravel. Possibly the technique may have application in heavily used spawning grounds.

Pink salmon spawned in the Vedder River in 1977 in areas that had been extensively dredged and worked over in 1976 following the severe flood in December 1975. The population was only 48,561 , considerably lower than in 1975. The fish spawned primarily in the section of the river that had been dredged and redyked, and did not use the portion of the river between. Vedder Crossing and the upper end of the dredged area. The survival of eggs deposited in this dredged area will be measured in the spring of 1978.

It is anticipated that the joint federal-provincial board will approve expenditure of funds in 1978 for construction of set-back dykes that will provide greater flood protection to adjacent lands and eliminate much, if not all, instream activity to maintain the flood-carrying capacity of Vedder River.
