The Fraser River Panel met Tuesday, August 26 to receive an update on the migration of Fraser sockeye and review the status of migration conditions in the Fraser River watershed.

At the meeting today, the run-size estimate of 2,200,000 Early Summer-run sockeye was decreased to 2,000,000 fish with a 50% marine migration timing through Area 20 of August 8. At the meeting today, the run-size estimate of 7,000,000 Summer-run sockeye was decreased to 6,000,000 fish with a 50% marine migration timing through Area 20 of August 14. Assessments of Late-run sockeye abundance are ongoing. Recent test fishing catches indicate 94% of the Fraser sockeye are currently passing through Johnstone Strait.

On August 25, the Fraser River water discharge at Hope was approximately 2,511 cms, which is approximately 17% lower than average for this date. The temperature of the Fraser River at Qualark Creek on August 25 was 18.4 °C, which is 1.2 °C higher than average for this date. Fraser River water temperatures at Qualark Creek are forecast to decrease to approximately 18.3 °C by August 31. Sustained high water temperatures can cause severe stress to migrating sockeye and may lead to significant en route mortality. Migration conditions for Fraser sockeye will be monitored closely and appropriate management actions will be taken.
