The Fraser River Panel met Friday, September 5 to receive an update on the migration of Fraser sockeye and review the status of migration conditions in the Fraser River watershed.

At the meeting today, the run-size estimates of 1,900,000 Early Summer-run sockeye and 8,200,000 Summer-run sockeye were unchanged. The Panel agreed to continue using the Late-run sockeye pre-season median forecast abundance level (p50 forecast of 12,730,000 fish) for planning purposes. Recent test fishing catches indicate 99% of the Fraser sockeye are currently passing through Johnstone Strait.

On September 4, the Fraser River water discharge at Hope was approximately 2,351 cms, which is approximately 10% lower than average for this date. The temperature of the Fraser River at Qualark Creek on September 4 was 17.0 °C, which is 0.9 °C higher than average for this date. Fraser River water temperature at Qualark Creek is forecast to increase to approximately 17.9 °C by September 10th. Sustained high water temperatures can cause severe stress to migrating sockeye and may lead to significant en route mortality. Migration conditions for Fraser sockeye will be monitored closely and appropriate management actions will be taken.

The Panel announced the following regulations for Panel Area waters:
